

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 209. NEW SERIES.

SATURDAY, JANUARY 1, 1848.

PRICE 1½d.

THE POETRY OF LIFE.

AMONGST all the riddles which philosophers have delighted in propounding for their mutual mystification, perhaps few have been put forth with an air of deeper profundity than the simple, yet home-coming question—What is life? Well, we need hardly be surprised; for (to follow in the same enticing path) there certainly is no one question to which so many inconsistent, yet genuine answers have been, and will be, returned. The philosophers may claim to themselves the merit of propounding the query; but the whole congregated voice of humanity would be insufficient to fill up the reply. Of all the myriad inhabitants who now tread the surface of this chequered planet, of all the beings who throng the immeasurable universe, each is practically working out his own especial answer to this searching question. Generation after generation will be called into being, each adding its portion to the mighty chorus, each presenting some new phasis in the infinite portraiture of life. But what then? Because the stream is exhaustless, shall we refuse to drink? Because the field of vision is interminable, shall we therefore refuse to look around us? Let us rather climb to the mountain's top, and gaze with chastened reverence and uplifted hearts into the far-extending view. Let not our souls rest from their striving, till we have at least solved the riddle of our own humble destiny, till we have patiently discerned the bearings of our own narrow path in the vast labyrinth of existence.

What, then, is life? 'A gilded toy,' lightly exclaims one; 'a feather borne upon the passing breeze, a bubble floating on the stream, sporting and sparkling brightest in the gayest sunshine! This is life; this the golden measure of all our hopes; this the sum of mortal joy! Merrily the sand runs through, even to the last bright grain; and then— Well, as ye will! Look for care, ye who like it best: trouble may always be had for seeking; and that without stint, without even an envious grudge. To live, is but to enjoy life: let each, then, follow his own heart's bent. Live, and let live, while ye may; the world is wide, and time too short to waste on idle fears!' Alas, poor butterfly! heedlessly thou sportest in the glittering sunshine. But is it well with thee, that all thy joy, thy very life, should come and go at the bidding of an accident? Think yet again, thou giddy trifler. Art thou, then, the merest sport of circumstance—a helpless atom in a heedless whirl, the ready football in a game of chances? Is it all recklessness and hazard? Has thy life no deeper meaning than the rattling of thy dice-box? 'If so,' impatiently ejaculates yon careworn despiser of others' follies, 'the sooner he is safely laid in his last long box the better for himself and others. The world could manage very

well without any such idle lumber. The only sensible purpose of life, is to make your fortune as honestly as you can, and then enjoy it. Make yourself independent of everybody. No frisking about at other people's expense. And what signifies the nonsense and whimsicalities of a poor, squeamish, uncomfortable being, not worth as much as would pay for his own coffin? Who really cares for such a man? Nobody. There are plenty of them. Good sort of men enough in their way: no doubt mean very well; fancy they have some destiny to accomplish, and all that sort of thing. But what does it all come to? Why, you might see them die off by scores, like flies in frosty weather. And who ever troubles himself about any one of them? Nobody—nobody. Unless, indeed, he happens to have tickled the fancy of your gossiping readers; and then, likely enough, when he is dead, they'll give a grand dinner in honour of his starvation, and say all manner of fine things about him, and wish they had got him amongst them, so that he might "die over again," I suppose. What man of any sense would squander away his life in such miserable folly? I am a man of some experience; and, take my word for it, there is nothing like an independency, and nothing like working hard for it. There ought to have been a notice stuck up in the world long before this time—"No admittance except on business." It would have saved a deal of misery. Talk about the object of life! If you want a pattern that will wear well, and not wash out, stick to addition and multiplication: no idle frippery, no sentimental drivelling.'

Still, what is life? oh man of sage experiences! Is but to live life's proud prerogative? Is, then, its only good, defence from evil? Has it no reality save toil?—no recompense, but that same dreary independence? Is its whole amount to dig a sullen grave, deeper—deeper, even while strength shall last, and then lie down in cold security? Has life no deeper spring than this?—no wider scope?—no loftier purpose?

'Loftier? Ay, as the eagle's proudest flight is loftier than the paltry burrowing of a dormouse!' responds an eager, fretful voice. 'Fortune is well, and toil must be endured; but for what? For their own sweet sake? No: nor for a barren independence! That we are born into a world of strife and toil, is true; but let us at least strive like men, conscious of the lofty prizes that await our grasp. Who that had a soul nobler than the grub upon which he treads, could tamely creep through life without a prouder thought than stirs within the precincts of an ant-hill? For what do we live as men, if this be all our lot? Why not mere ants? Why not our dull concerns directed by the same unerring instinct? Because those same concerns can yield a richer and a nobler harvest for those who have the strength to use the sickle. The soul must be arbiter of its own

free lot—the forecast and fulfilment of its chosen purposes. And for what was man thus gifted with a consciousness of thought, a power of self-inspection, a capability of controlling even his own strong passions, and bending all to the accomplishment of one life-absorbing object? Why was man, thus highly gifted, placed to struggle and to sympathise with his fellow-man? Was it that he should dedicate his undying energies to the merest insect task of procuring a brief and petty subsistence? Was it for this, oh beneficent Giver of life and power! was it for this thou gavest man dominion over all thy creatures? Nay, rather, he who thus circumscribes his own life, basely renounces his noblest inheritance; and another shall lead him, and rule over him. What can distinguish man most nobly from his fellows? What, save the greater power of influencing all for good? To attain this power, to exert this God-like influence, is the truest and proudest object of human life. This alone can shed a lustre over life's brief struggle, and cast an undying radiance throughout succeeding generations. If you seek an object worth the living for, let it be to make the world your debtor.'

'Even so, brave sir!' adds a fourth in chilling accents; 'fondly anticipating a lively and indefatigable appreciation of all that you haven't done, as the most touching acknowledgment of your wondrous merits. What is life? sayest thou. The caterer of death: a cold and withering mockery: a gaudy-seeming tree, whose sweetest fruit is gilded rottenness. Joy to thy proud aspirings, thy yearning sympathies, thy lofty purposes, thy bold and generous trust in human gratitude! Fond dreamer! a cold and bitter morning is at hand: happy for thee if death relieve thy folly from its hideous awakening. Dream on until thine eyes are opened to the stark reality; and then—nay, shrink not from thy hard-earned portion—look to receive wretchedness for thy pride, coldness for thy sympathy, misrepresentation for thy noblest purposes, and a freezing mixture for thine expected gratitude, turning all into an iceberg. Oh, 'tis a brave world to try the toughness of a heart! Your veriest earthworm is life's true philosopher: he looks for nothing, and he finds all he seeks.'

'Peace, troubling spirit!' exclaims a deep, stern voice, in tones of mingled sorrow and reproof; 'nor with thy bitter sarcasms thus belie thy Maker's wondrous plan. Despite thy mockery, man has indeed a noble purpose to achieve; and high or low, or rich or poor, may equally attain it. Nor is man's destiny a poisoned drop, a foul anomaly in God's fair universe. But what is man? Bethink thee well. Why should he thus have dominion over all, and become the chosen delegate of Omnipotence? The answer should afford a clue to the mystery of his being. He is an image of the Self-Existent. He only of earth's inhabitants, by a conscious and voluntary effort, can mould and fashion his own life's character; he only can look into his own mind, and deliberately choose whether he will indulge his natural and hereditary inclinations, or whether he will struggle to conform his whole future life to some standard of excellence which his intellect recognises and approves; he only can say to the enticements and promptings of his own dark passions, "How can I do this great wickedness, and sin against God?" He only can momentarily determine, and thus *seemingly create*, his own life's destiny. He only can subdue and govern his own little world within; and it is only then that he can worthily influence the larger world without. Such is the tenure by which alone man stands at the head of God's creation; and such is the inalienable birthright, the essential characteristic, of every human being: and thus is man an image of his Maker. The Omnipotent Creator is alone the *I AM*—the Self-Existent: the dependent creature is the *I will be*—the self-determining. What, then, is it that we may be, if we will? What is that which no power can determine for us? In short, what is the great business

of human life? Simply this:—to bring our own short-sighted, scattered, and isolated wills into harmony and conjunction, and thus into voluntary dependence upon the one Immutable, All-perfect Will. Not vaunting ourselves in, or looking wistfully to, our own vain strength; but trustfully yielding our entire selfhood to the guidance of truth and justice, and thus becoming the voluntary and conscious channels of an all-perfect, universal Love—happy, and dispensing happiness, while heaven and earth endure! Surely this is a purpose not all-unworthy of the Wisdom that could frame the illimitable and wondrous universe! And should we murmur if a parent's love should seek to purify, instead of pampering, our stubborn wills? Could not the Power that so clothes the field, and guides the instincts of the brute creation, have as easily insured our earthly happiness, if that were all? Oh man, turn not thus heedless from thy loftiest yearnings! This wide and visible universe, with its bitter trials and its fleeting joys, is but the seminary of immortal souls!'

Reader, dost thou still ask—What is life? We reply, with deepest reverence—Essentially, it is the only Absolute Existence: the spring of all activity: the inmost reality of all substance. Its high and hallowed name is Love—eternal, all-inspiring, all-encircling Love. This material, steadfast, and imperishable creation, with its countless activities and forms of use, so perfectly and inextricably apportioned to our sensuous powers, and so wondrously ministering to our highest wants, is but the outmost vesture of Omnipotence—the ultimate, yet ceaseless and infinitely-certain emanation of Him who alone is essential Life, essential Substance. All this seeming solidity, impenetrability, and absolute extension, is but the fixed and necessary relation which external objects bear to our sensuous perceptions: the true certainty of nature, and of nature's laws, arises from the whole created universe, with its innumerable inhabitants, being momentarily dependent for existence upon the one eternal Source of all truth, order, and perfection. Even man, with all his high capacities, is no self-dependent atom in the circle of existence. He may indeed thus isolate the whole aim and conscious effort of his being; but even then, he is no self-sustaining, independent unit; he does but abuse the power for good in which he is beneficently and momentarily upheld. Our life is essentially a continued choosing of good or evil. We may either look to our own wishes as our highest rule of right and wrong, and to their gratification as the ruling motive of our voluntary efforts; or we may look to infinite and eternal Truth for guidance, and to the good of all as the single, earnest aim of our existence. In either case, our own misery or happiness is simply the necessary consequence of our choice, not the motive deliberately chosen. In the one case, we strive to appropriate the enjoyments of others to ourselves, and instead of succeeding, lose even our own in the struggle; in the other case, we strive to impart our own delight to others, and having done so, find our highest happiness in theirs. This is the essential difference between selfishness and disinterested Christian love; and notwithstanding all the sophistry that has been uttered on the subject, they are, and ever must be, as a rule of life, altogether distinct and opposite. To walk worthily our appointed course on earth, we must continually strive to live a life of usefulness, from a principle of duty, and of good-will to all; and it is only in proportion as we do so, that we can dispose our hearts to receive those higher and purer influences which an infinite Love and Goodness is ever yearning to impart. What, then, is the truest poetry of life? It is that which awakens in our conscious souls the deepest, the fullest response; it is the chosen purpose for which we fain would live. The means by which it may be realised are infinitely various, according to the nature and extent of our several capacities. And yet one God created all, and one unspeakable purpose breathes through all His works: the highest poetry must draw our hearts to Him.

We promised, on a former occasion,* to attempt a further development of this high theme: if we have now succeeded even in indicating its momentous interest, our promise is redeemed.

JEMIMA'S SUPPER.

BY LEITCH RITCHIE.

I HAVE often wondered what would become of us if it were not for the misfortunes of our neighbours. If there were no poor, which of us would be rich? If there were no sick, what would the doctors do? If there were no sinners, how would the clergymen get their living? Would it not seem that the aim of philanthropy is to ameliorate the condition of some at the expense of others; to pull down at the same time that it exalts; and so to bring society to one level, one gauge, and one rate of progress?

But I must not suffer the subject to run away with me; my business at present being with only one kind of misfortune—that which determines people to let lodgings. Board and lodging, be it observed, is in quite another category. Its motives are highly philanthropical—a love of the human kind, a hankering after the presence of our species; and the individual so haunted advertises his benevolent infirmity in the newspapers, and offers board and lodging 'for the sake of society.' Furnished apartments, on the other hand, are compulsory. By some train of circumstances which it is impossible to explain, people acquire a superabundance of rooms, and find themselves in a complete fix. They advertise the emergency, put up a bill in their windows, and signify that 'having a larger house than they require,' they will most willingly let furnished apartments.

Mr and Mrs Plumley had been in this predicament for more than twenty years. They were every now and then making public the fact, that they had a larger house than they required; every now and then filling it to the roof with lodgers; and every now and then seeing it grow emptier and emptier, till at length it contained only themselves two and the maid-of-all-work. But in all this they were by no means the sport of fortune; for accidents happen so uniformly in the world of London, that the revenue derived from this traffic in rooms was as regular, taking one year with another, as an annuity. Still the business was far from being destitute of excitement. On the contrary, its hopes and fears, disappointments and gratulations, came as regularly as the circumstances that gave rise to them.

While the house was full, no mere mundane couple could live more happily together than Mr and Mrs Plumley. Mr Plumley was a good-tempered, easy-going man so long as things went well with him; and at such times he would occasionally take his wife to the boxes of Sadler's Wells, or the pit at the Adelphi, and not unfrequently bring home something nice in his pocket for supper. But when the apartments began to thin, and Mr Plumley found himself rising gradually, by the efflux of lodgers, from the kitchen to the drawing-room, a change as gradual took place in his manner. His eyes grew sterner and sterner as he looked at his wife; and hers, in conscious innocence, returned the gaze with scorn and defiance. But Mr Plumley, though conscious that Mrs Plumley was somehow or other in fault, was too dignified for vituperation; and she, on her part, was far too much of a lady to intrude her discourse upon anybody. The state of their feelings therefore was betrayed, not in words, but the want of them. A dreadful silence brooded over the house; and as the last lodger departed, Jemima, the maid-of-all-work, who was by this time suspected of being at the bottom of it, constantly received warning.

Jemima was a fat, slovenly-looking young woman,

with unspeakably dirty hands, her cap always awry, and the mark of an intensely sooty finger never absent from her good-looking face, drawn either across the cheek, or along the side of the nose, or above the eyebrow. If slovenly, however, she was not idle, but the very reverse. She was always scrubbing something or other morning, noon, and night; and although it must be owned she dirtied more than she cleaned, still Mrs Plumley, following in her trail, cleaned after her, so that all was right in the end. Among Jemima's recommendations was a very remarkable memory, which received everything whatever that was offered it, but almost the next moment let all out again; its meshes being as wide as those of an act of parliament, through which a coach-and-six may be driven. She was not unconscious of this peculiarity; but it only gave rise to a sort of pride of genius, since she felt herself capable of supplying the deficiencies of nature. This she did (having never been taught the common alphabetical signs) by inventing an artificial memory, in which sundry kitchen matters were invested, by a special arrangement, with an occult meaning only known to herself. It is true Mrs Plumley, whose genius lay in the methodical, made a point of sweeping away every trace of such memoranda as soon as she set eyes on them; but that, as Jemima said, was missus's fault, not hers. And so, with cleaning and dirtying, remembering and forgetting, scolding and recrimination, the day had its sufficient occupation; and each night, as she sank into her welcome bed, drew its black sponge across the page, and blotted out its characters for ever.

The era of silence, it may be observed, was always one of great awe to Jemima. She moved about the house as if in muffled slippers; looked mysteriously at her master and mistress; and answered in a whisper when spoken to, though more frequently merely nodding her head with solemn significance, instead of saying 'Iss, mum.' After receiving warning, she devoted every spare minute she could appropriate to arranging her things—that is to say, taking them out of her box, and leaving them here and there on chairs and stools; but never having time to go after a new place, when the tide of lodgers began to flow again, she always received a re-engagement; and after a touching scene with her mistress, restored her things to her box with much sobbing and blubbering, and began her service anew.

One day when Mrs Plumley was sitting alone in her desolate drawing-room, wondering what ever it could be that prevented lodgers from coming, a smart rap was heard at the street door; and as Jemima rushed to answer it, with a bath-brick in one hand and a case-knife in the other, she could not help, in the fulness of her heart, screaming up the stair (though then under warning), 'It's a lodger, mum!'

'Show him up!' replied Mrs Plumley nervously; and presently there walked into the room an indubitable lodger, who took the second floor in less than five minutes. He was a stout, middle-aged man—a man of perfect respectability, as any one might see at a glance; short-sighted, as respectable persons almost always are; quite competent to pay his way, and intimately conversant with the fact himself. He said his name was Mr Magnus Smith, and gave an undeniable reference in the immediate neighbourhood; on which Mrs Plumley smilingly observed, 'It was of no consequence, as she happened to know a gentleman when she saw him.' Mr Magnus Smith desired to come in that same evening, which was the reason why his wife, in order to save time, was at the moment looking at the lodgings next door. Mrs Plumley was quite agreeable, and rather thought that his good lady would be under little temptation at No. 14, though, for her part, she had no acquaintance with the persons whatever, not even knowing their names, although they had lived side by side for twenty years and more.

As Mr Magnus Smith passed through the narrow hall on his way out, he told Jemima that they should want something for supper.

* See 'Poetry in All Things,' No. 118.

'Let it be a lobster,' said he; 'I hear them bawling about: a small lobster, mind—and cheap of course.'

'Oh yes, sir; small and cheap,' replied Jemima, treasuring the description.

'And we shall want some bread and butter—only a little butter, for Mrs Magnus Smith is particular in the article, and will see about it in the morning herself. Do you mind?'

'Oh yes, sir.'

'And—let me see—a pint of beer; that's all, I think—yes, that's all.'

'Oh yes, sir!'

When he was gone, Jemima went to and fro about her business, getting the supper by heart, till she should have time to make a memorandum of it; and no sooner had the door shut, then it was stealthily opened again by Mrs Plumley, already in her bonnet and shawl, who, having watched the lodger out of sight, hurried after the reference.

Presently Mr Plumley came in, and after casting a severe look upon Jemima, who was viewed in the light of a culprit, walked solemnly up the stair, and seated himself in the desert drawing-room. He scorned to ask for Mrs Plumley, although he could not but think that the silence of the house was still more awful than usual. In a little while, however, his meditations were disturbed by a smart rap at the street-door; and on the principle that it never rains but it pours, a second lodger made his appearance. This was a middle-aged gentleman, like the other, apparently a most respectable man—although the dusk being now a little advanced, Mr Plumley could not see him very well—who had come up with his wife by the rail, whose name was Mr Thompson, and who wanted to enter that evening. This gentleman likewise preferred the second floor, which Mr Plumley very innocently let to him.

When Mr Thompson was going out, he told Jemima that they should want something to eat before going to bed.

'Oh yes, sir,' said Jemima, conning her lesson—'a lobster'—

'Well, that is a good thought—let it be a lobster. A small one will do.'

'And cheap of course,' added Jemima.

'Of course: you are a sensible girl: and we shall want a little bread and butter.'

'Oh yes, sir; a little butter will do, I know, for the good lady is particular in the article, and will see after it herself in the morning.'

'Upon my word, you are a sharp, thoughtful creature; and I say, my dear, you will not forget a pint of beer. That's all.' Mr Plumley dogged him out, to see after the reference; and Jemima, elated with the unaccustomed praise she had received, ran down to the kitchen to make her memoranda. This she accomplished by placing one of her pattens on a plate on the dresser to represent the lobster, and fixing the other upright against the wall for the pint-pot; a bit of bath-brick and a slice of carrot serving for the loaf and the print of butter. As a new thought struck her, she selected the tiniest lump from a handful of small coal, and placed it on the patten in the plate, to denote the moderate size of the lobster; and then, after indulging in an admiring glance at the supper, though terrified at the loss of time, she threw away the rest of the small coal, and flinging herself madly upon the loaf, set to work to cut bread and butter for her master and mistress's tea.

When Mr and Mrs Magnus Smith came that evening at the hour agreed upon, they were for some time engaged in a critical inspection of their new abode; and upon the whole they were well satisfied with their bargain. Their sitting-room, it is true, was finished, so far as the builder and house-carpenter's work went, like a bedroom; for these gentlemen magnanimously disregard the customs of the London majority, and determine that the second floor shall consist of bedrooms to the end of time. But although a little low in the roof,

bare of cornice, and scraggy about the chimney, it was nothing less than genteel. The furniture, nevertheless, was scanty; for people have not the more furniture that they have a larger house than they require. The chairs, made of imitation rosewood, and cane-bottomed, 'hollowed to one another' across the wide channels between; the square mahogany table in the middle of the floor was small, even with the addition of two narrow wings kept expanded by brackets; and the carpet, though at its utmost tension, did not approach the wall by a chair's breadth, and left the apertures of the windows altogether uncovered. The works of art on the mantelpiece were two small lions in white china, and a small church in the middle, of the same material. Above the church there hung in a black frame an almanac of the year 1827; and on the other walls were disposed Androcles and the Lion, and an original drawing representing two ships sailing before the wind to opposite points of the compass—a display of seamanship which would have delighted Allan Cunningham, whose celebrated outward-bound vessel, enjoying 'a wet sheet and a flowing sea,' and 'a wind that follows fast,' contrives somehow, notwithstanding, to leave 'Old England on the lee.'

When Mr and Mrs Thompson arrived, the former inquired if he could see 'the gentleman;' and on being told that he was already in the room, he strode at once up the stairs; but Mrs T. lingered behind to say a word to Jemima.

'You have remembered supper, have you?'

'Oh yes, mum; I have an excellent memory, if missus will only leave it alone.'

'You have a nice quiet place here, haven't you?'

'Oh yes, mum, uncommon quiet—desperate quiet; you will not hear a word a-piece from the three of us in a week.'

'Dear me, how odd! But she is a (whispering)—a comfortable person—one that one might put up with—eh? What's your name?'

'Jemima. Oh yes, mum. She is very comfortable, if she would only keep her hands off things that's of consequence. But that lobster!—you don't know the trouble I had about it; and as for the pint-pot, my back was no sooner turned than—whisk!—off it went behind the door like a shot!'

'That is awful!' said Mrs Thompson in dismay. 'What ever are we to do?'

'Oh yes, mum—pattens—coals—lobsters—bath-brick—loaves—carrots—butter—nothing in this world stands her!—not that she isn't comfortable enough, if she would only let other people's things alone.' Mrs Thompson ascended the stairs with nervous trepidation; and hearing voices in the sitting-room, went into the bedroom to make herself fit to be seen, and to collect her thoughts.

Her husband, on going into the room, took it for granted that the stout middle-aged gentleman he saw busying himself about the furniture was the same he had half seen in the dusk, and he bowed sociably to his landlord.

'This,' said he, 'I presume to be your good lady. How do you do, ma'am? I hope you are pretty well?' and Mr and Mrs Magnus Smith returned his politeness with interest, thinking that he was a very comfortable person indeed for a landlord.

'These are nice apartments of yours,' said Mr Magnus Smith, 'and in nice order; but this bell rope I shall get up to-morrow morning—at my own expense, sir.'

'Oh, you are very good, sir.'

'Don't mention it. I am in the habit of doing things liberal. I think, my dear, we have nothing more to say?'

'Nothing at all. It is getting late, and I am tired and sleepy. But don't stand, sir; never mind me;' and she sat down loungingly at the side of the table. Mr Thompson thought this was uncommonly cool, and wished the good people would not bother him on the first night of his new lodgings. He did sit down, how-

ever, at the bottom of the table; and Mr Magnus Smith, after staring at him for a moment, sat down at the top. An uncomfortable silence prevailed for a minute or two; but as the man would not go, Mr Magnus Smith at length felt constrained to say something in the way of conversation.

'May I beg, sir,' said he, 'to ask what is your opinion as to what we may expect from these new people this session?' The question was fortunate; for Mr Thompson felt that if he was strong on any subject in this world, it was on politics.

'Sir,' said he, 'my opinions on such points are not rashly formed; that is all I venture to say in their favour. I do not tell you that they are worth having, but merely that they are well considered; and it is therefore with some confidence I reply that, in my humble judgment, the question you have mooted is involved in doubt—in doubt, sir—the expression I advisedly use, is doubt.'

'That is just what I have said all along; and as for Lord John'—

'Sir!' interrupted Mr Thompson, laying his hand upon the table firmly—'Lord John I will trust to a certain point, but no farther. I will not trust him more than is reasonable, not a jot—I tell him that to his face. Lord John, it is true, is prime minister, and the humble individual who has now the honour of addressing this company is—no matter; but there are some men who are Englishmen as well as other men—who have hearts in their bosoms—who have brains in their heads—who have blood in their veins—who have money in their purses—and all which I beg leave to notify respectfully to Lord John with the most supreme indifference as to how he takes it!'

'Sir, you are a brick!' cried Mr Magnus Smith suddenly, as Mr Thompson threw himself back in his chair. 'I am not in the habit of flattery, and have no occasion to flatter any man, lord or no lord, seeing that I pay my way; but what I say is this, and I say it without disguise, that an individual entertaining such noble sentiments is emphatically a brick! Drink, and pass the pot!'

Now it should have been mentioned that *Jemima's* supper was upon the table, and among the other good things, a pewter pint-pot; and Mr Thompson having ascertained, though with some difficulty, that the latter contained about as much beer as usually falls to the lot of a lodger's measure, put it straightway to his head. As he drank, however, the pride of oratory wore off; he could not help thinking it a most remarkable thing that he should have been invited in this cavalier manner to drink his own liquor; and he gazed sharply, suspiciously, penetratingly at his *vis-à-vis* over the pint-pot, and even after he had set it down. Mr Magnus Smith thought his landlord was a man of genius, and that this was the look of it. Nevertheless he began to feel a good deal chafed at the pertinacity of the visit; and it was with strong disgust he saw that Mr Thompson had left little more than dregs in the pint-pot.

The rest of the supper, besides the lobster, consisted of a penny loaf, so small and shrunken, that it looked as if it had been made on purpose for lodgers, and a pat of butter about the size and thickness of a half-crown, handsomely ornamented in bas-relief. But the lobster was the great feature of *Jemima's* spread. It might have been called the General Tom Thumb of lobsters, were it not for its extreme emaciation. The shell was the very smallest shell a lobster ever carried with it out of the sea; yet it was far too wide for the thin wiry meat seen through the fractures. The attention of all the three had been strongly drawn by the affair of the beer to the other furnishings of the table, when in the midst of their contemplation, they found the supper party increased by the appearance of a fourth guest. This was Mrs Thompson, who had probably been listening to the conversation, and who now entered in a negligent evening costume; and saluting Mr and Mrs Magnus Smith in a half-careless half-haughty manner,

looked the landlady to the life. Mr Magnus Smith found a difficulty in identifying her with the individual from whom he had taken the lodgings; but he remarked internally that dress made a great change upon some people, and was even a little daunted by the stiffness with which she sat down opposite his wife, and the look of desperate resolution with which she regarded that lady.

'I hope, mem,' said Mrs Magnus Smith, with rising colour—'I hope you find yourself comfortable? Pray make yourself quite at home—oh, pray do!'

'I always do, mem,' replied Mrs Thompson, 'especially in my own house! I am in the habit of paying my rent, whatever other people may do—although I make no allusions; and when individuals pay their rent, they have a right to consider themselves at home.'

'Rent, mem! do you talk to me of rent the first moment I have ever seen your face? Do you question my honesty?'

'Oh no!' said Mrs Thompson, with a scornful laugh, 'I do not question it at all. But perhaps you would like a little lobster?—or some bread and butter?—or you may have a fancy to taste the pint-pot behind the door? Some people are partial to bath-bricks, carrots, and small coal! But I make no allusions—oh no!' Mrs Magnus Smith grew pale with rage at these injurious hints; but being a lady of breeding, she repressed the words that rose to her lips, and snatching up the penny loaf, severed it in two, and spreading one half with half the pat of butter, ate it at Mrs Thompson: who, on the instant, imitated the manœuvre with the other half of the loaf and the remainder of the butter.

The two gentlemen, excited by this outbreak of their wives, felt their bristles rise, and glared fiercely at each other. Their position, in fact, was extremely unpleasant. Here were four adults desperately determined upon supper, and now with nothing before them to wreak their appetite upon but a finger-length of lobster. The question of right, however, was still more instant. It was surely a new reading of the law of landlord and tenant to suppose that a man—and not only a man, but a man and his wife—were privileged to intrude upon their lodger's privacy the very first moment of his arrival, and to drink his beer, eat up his bread and butter, and keep him out of his bed for ever.

'Sir,' said Mr Magnus Smith, rising indignantly, 'there must be an end of this! Since politeness and forbearance are thrown away upon you, I beg to wish you a particularly good-night!'

'Good-night, then,' replied Mr Thompson, rising likewise; 'good-night, with all my heart and soul; it is what I have been wishing this half hour!'

The two ladies rose, and curtsied scornfully; and then all four stood still.

Mr Magnus Smith waved his hand with dignity, as if dismissing the company; but Mr Thompson, with less refinement, instead of taking the hint, pointed to the door, as if he had said, 'Get out!' The two gentlemen then suddenly and simultaneously advanced a step nearer to each other, and their wives ranged themselves each on the side of her husband.

'Sir,' said Mr Magnus Smith, 'if I was not in my own premises, I would put you out at that door!'

'And if I was not in mine,' retorted Mr Thompson, 'I would throw you out at that window!'

'You insolent, ungrateful individual! What! throw me out of the window, after drinking my beer to the dregs, and seeing your wife devour my bread and butter!'

'Your beer!—your bread and butter! They were my own, and you know it, you intolerable sponge!—And both gentlemen ran to the bell to summon evidence of the fact, and drew down upon their heads the whole machinery. In an instant *Jemima* was in the room, as if called up by enchantment. She had a boot drawn upon one hand, and in the other a blacking brush, a considerable part of the contents of which she

forthwith transferred to her face, while putting back her hair with the bristles, that she might see and comprehend the scene more intensely.

'Look at this lobster!' said Mr Magnus Smith imperiously.

'Oh yes, sir; I know by the small coal it is all right. Don't you remember yourself it was to be a little un', and cheap of course?'

'You hear, sir? Your lobster indeed!'

'And the bread and butter?' said Mr Thompson; 'answer, girl!'

'Oh my!—oh gemini!—oh gracious!' cried Jemima, as she looked over the table, and even peeped under the tablecloth for the missing viands. 'Well, to think of that! If somebody hasn't been ageing and sweeping away the bath-brick and carrot clean off the dresser!'

'Bath-brick and carrot!' growled Mr Thompson. 'Did you not receive my orders, stupid?'

'Oh yes, sir; and you know yourself it was to be only a little butter, as the good lady was particular in the article, and would see about it herself in the morning. But that missus is always a ruining me!'

'That missus! Who is your missus? Isn't it this—person?' said Mrs Magnus Smith.

'Oh no, mum; that's the good lady.'

'Then who is this—individual?' said Mrs Thompson.

'That's the other good lady.'

'And who, in the name of wonder, then, is your missus?'

'Here I am, ladies and gentlemen,' said Mrs Plumley, sailing into the room with her husband; 'and sorry and ashamed we are of all the trouble you have had. But the truth is, Mr Plumley let the room to one party, and I to another; and all because we were not on speaking terms!'

The explanations that ensued may be imagined. Mr and Mrs Magnus Smith consented to be put into the drawing-room floor for that night; and liked it so well, that on the Plumleys making a slight reduction in the price, they took the apartments permanently. These good people took special care to be on speaking terms for the rest of their lives; and Mrs Plumley entered into a treaty with Jemima, whereby the latter agreed to evacuate the dresser, in consideration of the former ceding up for ever to her hieroglyphics the lid of her box.

JONATHAN COUCH ON INSTINCT.*

MR COUCH is a naturalist, well known amongst men of his own order, but hitherto not known in the field of general literature. He has here produced a volume of anecdote and speculation about animals—better in the anecdote than in the speculation, yet not without some good ideas in the latter department, mingled, however, with a good deal of what appears to us very inconclusive matter. He inclines to the modern views of animal psychology, and regarding man as possessing similar qualities to those of the inferior tribes, with the super-addition of an internal consciousness making him responsible for the rectitude of his actions, counsels that we should study the science of mind through what he rather happily calls Comparative Metaphysics. It is a great hint to throw out; but when and whence is to come the John Hunter who shall realise the idea?

Feeling it to be vain to attempt to follow Mr Couch through the loose texture of his speculations, we shall take him up in one of the branches of animal economy, which he illustrates by facts. We pitch upon the chapter on animal migrations, because it is the subject which has been least treated of in these pages.

The principal migrators are birds. The object in coming northward evidently is to obtain a moderate temperature for the business of bringing forth a family; the going southward seems to depend less on an anxiety to escape the rigours of the winter season, than simply

on the desire of returning, as it were, home, after finishing the affairs of incubation. 'A remark often made,' says Mr Couch, 'appears to be correct—that the swallow tribe go away earliest in the warmest seasons; but whether there be any physiological reason for this, is a matter of doubt. The principal cause of their early readiness for migration seems to be, that less interruption has been thrown in the way of the formation of the nest, and there has been a greater abundance of insect food for the support of the young, which has accelerated their growth. In an unfavourable season in these respects, or when other causes have occurred to retard the maturity of the brood, the birds have not only been kept later, but in many instances the migratory instinct has grown sufficiently strong to overcome the force of parental affection, and the brood has been left to perish in the nest. To attend on a helpless young one, a single swift has been known to remain for a fortnight after the departure of its race; and it is a frequent occurrence for the swallow to leave its late brood to perish in the nest.'

After many particulars of the migration of the swallows and swifts, Mr Couch adds some remarks on a subject which we believe to be as yet veiled in mystery. 'The invariable direction,' he says, 'in which migration is prosecuted, is not the least interesting portion of the proceeding: for though it is known to us that southern climates possess the warmest temperature, and the most nutritious and stimulating food, at the time when the summer haunts of migrants are becoming deficient in these particulars, still it cannot be supposed that a bird is in possession of this speculative knowledge; or, possessing it, that, without compass or guide, it should unerringly pursue the route that leads to it. Yet they rarely deviate to any great extent in the journey, uninfluenced by mountains or oceans that intervene; and even the young cuckoo, new from the nest of a foster-parent who is itself indisposed to the effort, and destitute of any guiding influence besides its own instinctive feeling, quits the land of its birth, and fails not to reach the country of its search.

'Inscrutable as this directing skill appears to our duller perceptions, it is not only constant in its manifestation among our little summer insect-hunters, but it is also possessed by birds whose opportunities of using it are only occasional. Domestic pigeons have been taken to remote distances from their home, and that, too, by a mode of conveyance which must effectually shut out all possibility of recognition of the local bearings of the direction; and yet they have returned thither with a rapidity of flight which marked a conscious security of finding it. I have known some of the most timid and secluded of our birds, as the wheatear and dipper, to be taken from their nests, and conveyed to a distance, under circumstances which must have impressed them with feelings of terror, and in which all traces of the direction must have been lost; and yet, on being set free, they were soon at the nook from which they had been taken. Even the common hen, which they had been carried in a covered basket through a district intersected by a confusion of hills and valleys, in a few hours was seen again scraping for grain on her old dunghill.

'The only explanation, in these cases, must be sought in the existence of perceptions to which the human race is a stranger; their possession of which is proved by the exquisite and ready susceptibility of most animals to changes of weather, long before the occurrence of anything which our observation can appreciate, or which can be indicated by instruments. While the atmosphere seems to promise a continuance of fair and calm weather, and the wind maintains the same direction, the hog may be seen conveying in its mouth a wisp of straw; and in a few hours a violent wind fulfils the omen. The cat washes, and some wild animals shift their quarters, in compliance with similar indications; and even fish, at considerable depths in the sea, display in their motions and appetite sensibility to the coming change. The latter circumstance especially, which

* Illustrations of Instinct, deduced from the Habits of British Animals. By Jonathan Couch, F.L.S. London: Van Voorst. 1847.

is well known to fishermen, is a proof that mere change of temperature or moisture is not sufficient to explain the phenomenon.

Animals much below birds perform occasional migrations, attended by extraordinary circumstances. We are told, for instance, of streams of butterflies and dragon-flies, which go on without intermission for days, no one being able to comprehend whence they have come or whither they are going. The flight of the locust is a too well-known phenomenon. Mr Couch quotes a curious account of a procession of caterpillars (*bombyces*) observed by Mr Davis. 'They were crossing the road in single file, each so close to its predecessor, as to convey the idea that they were united together, moving like a living cord in a continuous living line. At about fifty from the end of the line, I ejected one from his station: the caterpillar immediately before him suddenly stood still; then the next, and then the next, and so on to the leader. The same result took place at the other extremity. After a pause of a few moments, the first after the break in the line attempted to recover the communication. This was a work of time and difficulty, but the moment it was accomplished by his touching the one before him, this one communicated the fact to the next in advance, and so on till the information reached the leader, when the whole line was again put in motion. On counting the number of caterpillars, I found them to be one hundred and fifty-four, and the length of the line twenty-seven feet. I next took the one which I had abstracted from the line, and which remained coiled up, across the line. He immediately unrolled himself, and made every attempt to get admitted into the procession. After many endeavours, he succeeded, and crawled in, the one below falling into the rear of the interloper. I subsequently took out two caterpillars, about fifty from the head of the procession. By my watch, I found the intelligence was conveyed to the leader in thirty seconds, each caterpillar stopping at the signal of the one in his rear. The same effect was observable behind the break, each stopping at a signal from the one in advance. The leader of the second division then attempted to recover the lost connection. That they are unprovided with the senses of sight and smell, appeared evident, since the leader turned right and left, and often in a wrong direction, when within half an inch of the one immediately before him: when he at last touched the object of his search, the fact was communicated again by signal; and in thirty seconds, the whole line was in rapid march, leaving the two unfortunates behind, which remained perfectly quiet, without making any attempt to unroll themselves.'

Mr Couch devotes several chapters to the habits of birds, as illustrating a combination of instinct and reason; but they are of too desultory a nature to admit of extracts. The following regarding the mole is more concentrated, and also more original:—'The habits of the mole will vary with the soil, and particularly with the structure of the ground, as it is rich and deep, or shallow, level, rocky, uneven, or intersected with raised mounds or hedges of earth, five or six feet high, and of the same thickness, such as divide fields in the west of England. The presence of this animal is known by the heaps of fine earth, or hills, thrown up during its subterranean operations. In deep ground, little of its labours can be traced, except when thus marked; but in a thin soil, or in hard ground, a ridge is often driven along, which is distinctly raised above the ordinary level of the surface; and the mole-hill is only elevated where the earth is so fine and friable, that the removal of some part of it is necessary to give the creature a clear course in its runs backward and forward. The creep or run is in a zig-zag direction; and when the neighbourhood is very productive of its prey, exceedingly so, as if the animal were unwilling to pass out of so fertile a district. But for the most part it takes a straightforward course; and in the open space of a down, it passes through more than fifty paces of distance without lifting a heap, with a progress amounting to two or three human paces in a

day, and the whole run is two hundred feet in length. In the course of this passage, advantage is taken of any obstructions which occur, as if conscious of the probability of pursuit; and the run is made to pass among the roots of dwarf furze, and even under a large stone, while, at irregular distances, openings are made to allow of excursions on the surface, and the free admission of air. There are many lateral branches from the principal passage; but none of them extend to any great distance: for it seems wisely to avoid forming such a labyrinth as might confound itself in its daily course, or in its efforts to escape from an enemy, to whose depredations it is exposed even in its retreat. Its time of labour is chiefly at an early hour in the morning; but if everything be still, it may be seen at work at other seasons. The slightest sound or movement of an approaching foot stops the work, and no further lifting of the earth will be attempted that day. These runs are mostly made towards the end of autumn; are this creature's hunting-grounds for food; are abandoned when the soil has been thoroughly searched through and through; and though they are formed with so much toil as to make it desirable not to desert them while there is anything to be done there, yet in a month or two the animal quits them for new ground, perhaps at a great distance, where the hunting promises better success.

'A favourite spot for its winter-quarters, and one it prefers at other seasons, is in enclosed fields, under the shelter of a hedge of high-piled earth, along the middle of whose base the run is carried, and in whose mass of mould it finds security from cold and from its natural enemies. The heaps it throws up are cast on the sides, and at intervals a lateral passage is driven into the field, to which, when the inducement is powerful, it transfers its principal operations; and there encounters its greatest hazards from the traps of the mole-catcher, and the pursuit of the weasel and the rat, with whom it fights furiously, but without success. When undisturbed, the mole often shifts its quarters; and in making a new selection, its choice seems to be much influenced by caprice. It makes these changes especially in the months of July and August; but I have known it to take excursions of removal to such distances, that no mark of its presence could be detected in the month of January, if an open and moist season. A large part of such a journey must be along the surface; and it is probable that, at all times, this is its mode of emigration to distant places. In summer, much of its time is thus passed in migrations from one field to another, because the hardness of the ground renders it difficult to throw up the soil, and follow up the worms, which have sunk deeper down into the soil. It shows the same love of change in moist weather, when the ground is more workable.

'If not to its mind, the mole repeatedly changes its quarters; and though shut up in darkness, it reluctantly continues on the northern declivity of a hill, where it has little light, and less heat, unless its other advantages are unusually great. Its migration from one district to another exposes it to great danger, as it is slow to escape, and little prepared to defend itself.

'The run is differently formed in spring, in consequence of a difference of object. Where fields are not large, the hedge is still the selected spot; on which account its nest is not often discovered. Mr Bell has given a sketch of the skilful arrangements made for its safety at this time; but in districts where the hedge is chosen for defence, no other departure from its usual form is made than an enlargement of the space, and a more comfortable lining. Fourteen young ones have been discovered in one nest; but though the mole is not a social animal, it is hard to believe that they could have been littered by one mother.

'The mole may sleep more in winter than in other seasons, but it is not its habit to become torpid at this time. In frost and snow, fine earth is often seen freshly turned up, as evidence of its activity; but as it is a creature of great voracity, and cannot endure long fast-

ing, like many wild animals of that character, it is not easy to say how its wants are at this time supplied. A dead or living bird, numbed with the cold, is always a welcome morsel; but its track has not been seen in the snow in pursuit of it. It perceives the earliest approach of a thaw; and after long seclusion, a heap may be seen protruding through the thin covering of snow, as evidence of its sensibility to change of temperature—a circumstance more easily understood when we recollect that it is the radiation of heat from the inner parts of the earth which exercises the first influence in the change; and that it is because the air abstracts this heat more rapidly than the earth supplies it, that frost and snow are produced and continued. When, from changes in the atmosphere, this rapid abstraction ceases, the heat below becomes more sensibly felt; and this is first visible at the surface of the soil.

A good supply of drink is essential to the mole's existence; and its healthy condition is marked by a softness and moisture about the snout, where its most perfect organ of sensation is placed. The flexibility of that organ, and its command over it, are indeed exquisite; but it is not used in the operations of excavation and lifting. This is the work of the feet, neck, and the hinder part of the shoulder; and in these parts the mole is perhaps the strongest quadruped in existence, in proportion to its size. The heaps it throws up are not made simply by lifting; for the superfluous earth is collected at easy distances, and thrust along, until so much is accumulated, as compels it to convey it out of the way, and then its work in tunnelling goes on again.

The mole has more enemies than it is supposed to have; for though its disappearance from a district is sometimes due to emigration, there must be other causes at work to account for their extirpation in particular localities. They may destroy each other in their burrows, for they are exceedingly quarrelsome; the fox and weasel, too, are formidable foes; but the ceaseless war waged against them by man, the least excusable enemy they have, is the most destructive. Admitting that mole-heaps, and loosening of the soil by the runs made through a field, are inconveniences, and even injurious, and that it is unsightly to see a gentleman's lawn disfigured with these tumuli, such annoyances may be either removed or turned to advantage; and it must not be forgotten that their destruction of more injurious creatures is considerable. If it is desirable to expel them from their haunts, it may be done effectually without destroying them: for their extirpation is sure to be followed by a fresh invasion.

While we do not think that the reasoning in this volume will greatly advance philosophical zoology, we feel tolerably sure that the volume itself will be found readable, entertaining, and, in a modified sense, instructive.

THE CORNISH ALEWIFE.

A SKETCH FROM LIFE.

BY MARY BENNETT.

FAR from the town, where Tamar's waters flow,
An alehouse stood, a hundred years or so;
Quaint was the porch, with ivy clothed about,
And many a comely fowl marched in and out,
Graceful, and plump, and smooth, of glowing hue,
The pride of Molly, and her profit too;
Nor less her pigs, that were so white and clean—
Pigs so precisely trained were never seen.
She was a matchless housewife—sooth to say,
A better never met the face of day.
Full fifty years she kept this hostelry,
Hiding itself in orchard greenery;
And graced with flowers, in rustic garden set,
And shaded pasture-slopes that round it met:
Here the frog leaps, and here the robin sings,
And here the new-fledged linnet tries its wings;
Here Molly's oows regaled on scented clover,
Till night and Kitty called them under cover.
Well they knew Kitty—thrifty and fair was she,
And second mistress of the hostelry.

Few were the guests that brought the hostel gain,
But cheese and butter were not made in vain;
And Molly's clouted cream was known, I wis,
To fame as far as the metropolis.

'Twas true, though trite, things might have been much worse—
Old Molly might have had a lighter purse;
She might have had a heavier too, but that
She had a mind for charity and chat.
Off to her porch the wandering beggar came,
With all the news that he could find or frame,
The vagrant gossip of the town and dale,
To charm old Molly for a draught of ale.
And oft his mite, the little that he can,
Brings to the hostel the poor quarryman;
And finds a large return in warmth and ease,
Kind words, good home-brewed ale, bacon and cheese,
Beans, peas, what not—from Molly's ample stores;
And oft the wind-worn seaman from the shores,
And oft the swarthy miner from the caves,
Old Molly hailed—but never harboured knaves.

In chilling winter, when the wind blows fierce,
And the fell frost's sharp deadly arrows pierce,
How pleasant by the alewife's fire to sit
Warm, snug, and merry! while the gay beams flit
O'er her oak chest, like polished mirror bright,
Her red brick floor, where scarce a soil doth light,
Her milk-white tables, platters ranged with care,
Her folio Bible and her brass-clasped prayer;
Her antiquated prints upon the wall,
Prized as if Raphael had wrought them all,
Her corner cupboard with odd china stores,
(Seldom that precious hoard unclosed its doors);
Her mighty 'press,' where hung, all on a row,
Her family heir-looms, dresses kept for show.

'Newfangled ways 'old Molly hated quite,
As any Chinaman or Muscovite;
As unknown seas, to her were books and schools—
Nature and Gospel furnished all her rules;
These guided safely to the port where meet
The lowly pinnace and the stately fleet,
The nameless bark, the ship with colours spread,
Voyaging to the regions of the dead.
And now old Molly hears that silent strand,
The oar grows powerless in her aged hand;
'Tis dropped! Oh now farewell Life's troubled sea;
Welcome fair harbour of Eternity!

'Fetch me no doctor!' cries the stern old dame;
'I've lived without, and I will die the same:
To parson John's the road's a long ten mile,
Read me a chapter, it will serve the while.

'Kitty, give thou a horn of ale to the poor
Miners and quarrymen when I'm no more:
They'll often miss me, as they pass this way.
I was not flint to them that could not pay,
Beggars or workers—well thou knowest that—
If folk were honest, and observed the mat:
For when I found a poor soul hardly driven,
I lent my mite, and scored it up to Heaven.
And Heaven will pay me truly, there's no fear;
I wish it were much more in my arrears.
Bless God! though I've worked hard, I shall die free
Of the poorhouse, in my own old hostelry.
In thrift and toil I have not been forsaken,
I've had my independent bread and bacon;
Work thou for thine, there thy plain duty lies,
And read the Gospel, girl, and dry thine eyes.
I cannot read, thou know'st, a single word,
But yet I hope old Molly's prayers are heard;
And all is well for me, and Heaven is near,
And I can live or die without a fear.

'Tis midnight now, the moon is in the sky,
Draw back, and let me see it where I lie:
Ay—there it shines—down over moor and mead,
On tree, and bush, and bank, and flower, and weed.
It shineth down where I have lived so long,
Where to my sight a score of memories throng:
There, by that blasted oak, I often played,
With my young brothers when a little maid:
The tree was then as young and fresh as I:
And yonder, Kitty, all my kindred lie;

The old deserted grave-yard is their bed—
Sure I can see the turf o'er Peter's head :
There lay me with him, girl, when I am dead.

'Poor Dick, my bird, I give into thy care,
And I have left thee something for his fare
And for thy comfort. Dost thou weep for that ?
Death-tears soon dry, girl—Kitty, mind the cat !

'Now, Lord, I am ready ; take me to thy rest :
Near ninety years on earth I've been a guest ;
Now I come home to the House prepared by thee—
Set wide the gates, dear Lord, and welcome me.'

The strife is o'er, the beams of morning fall
On that stern image, stern, yet sweet withal ;
Sleeping decrepitude, old age's dower,
Hath fed, and left the impress of high power ;
But what or whence no mortal tongue may say,
Saw 'tis the seal of Heaven, though set in clay.

Bring the rude coffin, while the country poor
Stand in mute grief about the hostel door.
True mourners they ; and Kitty, faithful soul,
Dives each, for Molly's sake, a funeral dole ;
And, sighing at her heart, tends pigs and fowls,
And bird and beast—and when the screeching owls
Raise their wild night-cries, she, with shuddering speed,
Hinds bolt and bar, and sits her down to read,
Lonely and sad, beside the hostel fire,
Still anxious that the flames should kindle higher ;
For every shadow wears a ghostly gloom,
And seems a wanderer from the awful tomb.

Now goes the alewife to her earth-wrapped kin,
Unclose the turf, and lay her gently in ;
No glittering plate her humble name retains,
No floating pall o'er shades her pale remains :
She needs them not—in pious actions drest,
Death's simplest majesty becomes her best ;
Her rustic sense would have despised the rest.

FOREIGN PUBLIC LIBRARIES.

In all ages and countries, a public library is an institution most valuable ; but it was particularly so before the introduction of printing, when the price of books rendered it impossible for any but the wealthy to possess them. In early times, such collections shared in the casualties that befell all kinds of property. The fate of the early libraries of Egypt is well known ; and also that Rome was enriched with the literary spoils of Greece. But to come down to existing stores, we find that in the middle ages every large church had its library. That of the Vatican, founded by Pope Nicholas in 1450, was destroyed by the Constable Bourbon in the sacking of Rome, but was restored by Pope Sixtus V. in 1588, and has been considerably enriched with the spoils of that of Heidelberg, plundered by Count Tilly in 1622. It now comprises 100,000 printed volumes, and 40,000 manuscripts. The pope has recently issued an order for the public to have access to one department of it, consisting of 35,000 printed volumes, among which are many rare and some unique works, a great number containing marginal notes by celebrated men. The hall of the Great Council at Venice contains the library of St Mark, comprising 65,000 volumes, and about 5000 manuscripts. Petrarch 'laid its first foundations,' as he expresses himself in a letter respecting the donation of manuscripts that he sent to Venice, as an acknowledgment for the hospitality he found there during the plague. Only a very small number of his manuscripts are now there ; but the learned librarian, Morelli, has shown that the Venetians do not deserve the reproach of having allowed Petrarch's library to remain forgotten in a small room where it perished, for he had only given some few books. Twelve years after this donation, Petrarch left at his death a very precious library ; but it was dispersed, as is evident from the manuscripts preserved in the Vatican, the Laurentian, the Ambrosian, and the Bibliothèque du Roi ; and not one ever reached Venice. About 80,000 volumes and 900 manuscripts are contained in the beautiful library

of Ferrara—one of the most illustrious towns that cherished printing in its infancy. Among the manuscripts are fragments of some cantos of the 'Orlando Furioso,' covered with corrections, showing how Ariosto revised and polished his poem. The manuscript of the 'Scholastica,' one of his comedies, is very little corrected ; but this piece was incomplete when he died, and his brother Gabriele finished it. The manuscript of his satires is in good preservation, and curious for the different corrections in the poet's own hand. Another valuable manuscript is the 'Gerusalemme,' corrected by Tasso's own hand during his captivity. The words *Laus Deo* are written by the unfortunate poet at the end of this almost sacred manuscript. There are a great many suppressed passages in it, and several successive pages are sometimes crossed out. The other manuscripts of Tasso include nine letters, dated from the hospital of St Anne ; and some verses expressive of sorrow, desolation, and anguish, written from his prison to the magnanimous Duke Alfonso. Here is also the manuscript of Guarini's 'Pastor Fido,' exhibiting some few corrections, chiefly grammatical, by Leonardo Salvati. From Valery's 'Travels in Italy' we learn that the ancient choir-book of the Carthusians is now in the library, forming eighteen atlas volumes, covered with brilliant miniatures, the work of Cosmè's school. Equally magnificent is an atlas Bible, apparently by the same artists. One of the chief rarities is the 'Musculorum Humani Corporis Pictura Dissectio,' by the great Ferrarese anatomist of the sixteenth century, Giambattista Canani, who had some faint idea of the circulation of the blood—an undated edition, without imprint, but probably of 1541, illustrated with plates engraved by the celebrated Geronimo Carpi.

Cosmo de Medici founded at Florence, in 1560, one of the most complete libraries in Europe. 'From the intercourse that in his time subsisted between Florence and Constantinople, and the long visits made by the Greek prelates and scholars to Italy, the venerable Cosmo had the best opportunity of obtaining the choicest treasures of ancient learning ; and the destruction of Constantinople may be said to have transferred to Italy all that remained of eastern science. After the death of Cosmo, his son Piero pursued with steady perseverance the same object, and made important additions to the various collections which Cosmo had begun, particularly to that of his own family. But although the ancestors of Lorenzo de Medici laid the foundation of the immense collection of manuscripts since denominated the Laurentian Library, he may himself claim the honour of having raised the superstructure. If there was any pursuit in which he engaged more ardently, and persevered more diligently than the rest, it was that of enlarging his collection of books and antiquities. "His messengers," writes Niccolò Leonceno, "are dispersed throughout every part of the earth, for the purpose of collecting books on every science, and he spares no expense in procuring them." He derived great assistance in his efforts from Hieronymo Donato, Ermolao Barbaro, and Paolo Cortesi ; but his principal coadjutor was Politiano, to whom he committed the care and arrangement of his collection, and who made excursions at intervals through Italy, to discover and purchase such remains of antiquity as suited the purposes of his patron. Two journeys, undertaken at the instance of Lorenzo, into the east, by Giovanni Lascar, produced a great number of rare and valuable works. On his return from his second expedition, he brought with him about two hundred copies, many of which he had procured from a monastery at Mount Athos ; but this treasure did not arrive till after the death of Lorenzo.*

In France, a hundred and ninety-five towns are provided with excellent public libraries, containing altogether about 3,000,000 volumes, arranged in spacious

* Roecoe's Life of Lorenzo de Medici.

rooms, with salaried librarians, every accommodation for readers, and every disposition to assist them. These libraries are open to the use of all classes, even the most obscure applicants; no introduction, no patronage is required; the most valuable works, the most precious engravings, are confided to the inspection of any visitor. The five great public libraries of Paris contain altogether about 1,378,000 volumes. The Bibliothèque de Roi, or the King's Library, is the grand national one. It was founded by Francis I. in 1520. Henry II., in 1559, issued an order requiring booksellers to present to the royal library a bound copy of all the works they published. Under the reigns of Francis II., Charles IX., and Henry III., it received but few additions. Henry IV. (1589) caused it to be removed to Paris. In 1595 the collection of Catherine de Medici, consisting of 800 Latin manuscripts, was added; from this time to 1721 the books were removed from one house to another, in Paris, until, in the latter year, they were finally deposited in their present abode, the Hôtel Mazarin, Rue Richelieu. The library consists of upwards of 800,000 printed volumes, 100,000 manuscripts, and 1,000,000 of historical papers. At the public expense it annually receives an addition of about 15,000 volumes and pamphlets. It is calculated that it contains no less than twenty miles of shelf. The public, without distinction of rank or sex, have free access to this extensive library; but it appears that they are privately watched, to detect any who would mutilate or steal the books. M. Van Praet told Sir Henry Ellis that the secret police sit in the rooms; a system of surveillance which would be deemed offensive by the readers in our English libraries.

All the great libraries in Russia originated in the plunder of those of Courland and Poland. In 1704, Peter I. carried off from the town of Mittau 2500 volumes, which were the nucleus of the Imperial Library. In 1772, Catherine II. seized the collection of the Princes Radzivil at Nieswiec, consisting of 17,000 volumes. In 1795, the Zaluski Library, estimated by the Russians themselves at 260,000 printed volumes, and 11,000 manuscripts, was transplanted from Warsaw to St. Petersburg. After the taking of Warsaw in 1831, the university of that city lost 200,000 volumes, the Philomathic Society 20,000, the library of the Council of State 36,000, and that of Prince Czartoryski at Palawy 15,000. If we add to these the treasures of the suppressed convents, we shall find, without exaggeration, a total of 700,000 volumes which have been removed to Russia. The Imperial Library at St. Petersburg is the richest of the Russian libraries, and ranks as third among the collections of Europe. It contains about 442,800 printed volumes, and 14,480 manuscripts. It is very rich in the literature of Central Asia, and contains the works formerly belonging to Baron Schilling; seventy-three manuscripts of Colonel Stuart, relating to all the most important parts of Sanscrit literature; and also forty-three Mongolian and Thibetan works, collected at Pekin; altogether forming the finest collection of Oriental works in the world. This Imperial Library is open to the public three days in the week, but is visited by comparatively few readers, about eight hundred in the course of the year—an extremely small number for a capital whose population is nearly half a million, without counting the garrison or strangers. The cause of the library being so little used by the people is thus explained by Mr Köhl:—'On entering, visitors have to pass a whole cordon of police soldiers, the attendants on the library, who strip them of cloaks and greatcoats, which they return after strictly searching the owners at their departure; and many a one feels so nettled, that he comes no more. On your first visit, you can merely admire the magnitude of the different rooms, the apparent order of the books, and their splendid bindings, attended by a subaltern officer, who relates wonderful things about these literary treasures. To get a book to read in the library itself is all but impossible, though you can point out where it

stands. You must first write down the title in a large register, and then, if it is not lent, and can be found, you are supplied with it on the next library day. But it happens sometimes that you may wait for weeks in vain for a single book. The first time, the entry of the book has perhaps been overlooked, and you must write down the title again; next time, you are told it is not to be found, or the librarian to whose department it belongs is not in the way. Should you be prevented from attending on a library day, you lose your claim to the wished-for book, which has meanwhile been removed from the table; so that you are obliged to go on a fourth or fifth day to enter it again, and at last, on a sixth or seventh, to read it. On the days appointed for reading, you may many a time knock in vain, because it may happen to be one of the numberless festivals of the Russian church. The precautions, on the delivery of a book that is to be taken home, are so great, that one would think the library was merely intended for the safe custody of books, and not for introducing them among the people.* Besides this imperial collection, Russia possesses forty-two other public libraries, some of which contain 10,000 volumes.

The first circulating or lending library in Europe was established at Wetlar, in Prussia, by Winkler, the bookseller and printer, towards the close of the seventeenth century. Lately, in the city of Breslau, the Prince-Archbishop has founded a library for the working classes, to whom the books are lent out gratis. The number of volumes contributed to it amounts to nearly 2000.

In 1835, the Gottingen library contained, according to its librarian Dr Benecke, 300,000 works. It is fairly entitled to be designated 'the most useful library in the world.' It is open every day in the year to students; and free admission, during certain hours, is allowed to every person who may wish to see or refer to any work. Books are lent out daily, without any pledge or remuneration, but they must be returned in a month. Besides an extensive collection of Spanish, French, Italian, and Oriental works, here is a more complete collection of books on English history and literature than one can readily find in Great Britain. The Gottingen library has likewise the recommendation of a scientific or classed catalogue, and an alphabetical one; both kept in a state of strict completeness by the immediate insertion of the new books.

The library at Munich contains 500,000 volumes, but of which one-fifth at the least are duplicates; and the entire length of its shelves is computed to be fifteen miles and a-half.

Ten years ago, the university library at Vienna was reported to possess 100,000 volumes. The emperor's fine private library, an heir-loom in the imperial family, is also accessible to the public; every person being admitted free, without any previous application, and no instances having occurred of books being purloined. Sumptuous and costly works are not put into the hands of the idle and curious, but only into those of the studious, who do not visit the library for the sole purpose of looking at pictures. This library, which was begun by Maximilian I., contains above 300,000 volumes, all of which are admirably arranged and catalogued. Besides a general alphabetic catalogue, wherein all new acquisitions are immediately inserted, there are ten class catalogues; namely, of 12,000 volumes printed before the year 1500; of 6000 works on music; of all the Bibles; of Hebrew works; of Slavonic books; of Latin manuscripts; of 1000 Oriental manuscripts, besides 800 Chinese and Indian books; of 8000 autographs; of the valuable prints and maps; and a general classified catalogue of scientific books. After seeing what industry and perseverance have accomplished at Vienna, how can we be cajoled by the lazy excuses made for the want of proper catalogues at the British Museum Library!

The Royal Library of Copenhagen contains 463,332 volumes, and about 22,000 manuscripts. After eleven years' labour, a catalogue of all the books, and of one-fourth of the manuscripts, was completed by the conservators, and published at the expense of the government. The catalogue itself extends to 174 volumes.

The Royal Library at Stockholm, founded by Gustavus Vasa, and greatly increased by Gustavus Adolphus, is not so large as is commonly supposed; its printed volumes scarcely amounting to 70,000, while its manuscripts are only 5000. It would have been much more extensive but for the plunder of Queen Christina; for the ease with which she allowed literary men to take the books away; and for the great fire which, in 1697, destroyed a great portion of it. In this library, the excellent system is adopted of giving to each class of books a distinct colour of binding. Among the manuscripts, the most curious is one brought from Prague after the conquest of that city, and called the 'Devil's Bible,' from a fanciful representation of that personage, though it is also known by the name of the 'Codex Giganteus;' and gigantic indeed it must be, to contain not only the Latin Vulgate, but the works of Josephus, some treatises of St Taidore, a Chronicle of Bohemia, and several Opuscula.

The most northern library in the world is that of Reikiavik, the capital of Iceland, which, nearly forty years ago, contained 3600 volumes. About the year 1731, Franklin established by subscription the first public library in Pennsylvania. There are now many public libraries in the United States. In most of the principal towns of New York, 'school district libraries' have been established by law, at a cost of about half a million of dollars, and are exempt from all taxes. The public library of Mexico contained, ten years ago, about 11,000 volumes; but four convents there possess libraries the total amount of whose volumes is more than 32,000. In many of the Mexican provinces, libraries exist whose contents vary from 1000 to 3000 volumes.

THE BUSHMAN.

A work bearing the title of 'The Bushman, or Life in a New Country,' would naturally be expected to contain a history—real or fictitious—of the adventures of a colonist, either in South Africa or Australia, while engaged in creating for himself a 'home in the bush.' This, however, is not precisely the character of a volume recently published with that title.* It is rather a general description of Western Australia, by a gentleman who went out to that country in search at once of health and competence. Mr Landor (who seems to have been educated for the legal profession) was, it appears, a 'victim of medical skill; and having been sentenced to death in his own country by three eminent physicians, was comparatively happy in having that sentence commuted to banishment.' A wealthy man would have gone to Naples, to Malta, or to Madeira; but a poor one has no resource save in a colony, unless he will condescend to live upon others, rather than support himself by his own exertions.

Mr Landor had the great advantage of being accompanied by his two brothers, who, with him, represented all three of the learned professions—the elder being 'a disciple of Æsculapius,' and the younger 'a youth not eighteen, originally designed for the church, and intended to cut a figure at Oxford;' but who 'modestly conceiving that the figure he was likely to cut would not tend to the advancement of his worldly interests, and, moreover, having no admiration for Virgil beyond the *Bucolics*, fitted himself out with a Lowland

plaid and a set of Pandæan pipes, and solemnly dedicated himself to the duties of a shepherd.'

Considering that the author styles himself a 'poor colonist,' the account which he gives of their outfit is somewhat startling: it certainly does not come up, or rather down, to ordinary notions of poverty. 'We had with us,' he says, 'a couple of servants; four rams with curling horns—a purchase from the late Lord Western; a noble bloodhound, the gift of a noble lord famous for the breed; a real old English mastiff-bitch, from the stock at Lyme Regis; and a handsome spaniel cocker. Besides this collection of quadrupeds, we had a vast assortment of useless lumber, which had cost us many hundred pounds. Being most darkly ignorant of everything relating to the country to which we were going, but having a notion that it was very much of the same character with that so long inhabited by Robinson Crusoe, we had prudently provided ourselves with all the necessaries, and even non-necessaries of life in such a region. Our tool-chests would have suited an army of pioneers; several distinguished ironmongers of the city of London had cleared their warehouses in our favour of all the rubbish which had lain on hand during the last quarter of a century; we had hinges, door-latches, screws, staples, nails of all dimensions, from the ten-penny downwards; and every other requisite to have completely built a modern village—of reasonable extent. We had tents, Mackintosh bags, swimming-belts, several sets of saucepans in graduated scale (we had here a distant eye to kangaroo and cockatoo stews), cleavers, meat-saws, iron-skewers, and a general apparatus of kitchen utensils that would have satisfied the desires of M. Soyer himself. Then we had double and single-barrelled guns, rifles, pistols, six barrels of Pigeon and Wilkes's gunpowder; an immense assortment of shot, and two hundredweight of lead for bullets.'

In addition to the foregoing, they had supplied themselves with no less than eighteen months' provisions, in pork and flour, so that, says the author, 'from sheer ignorance of colonial life, we had laid out a considerable portion of our capital in the purchase of useless articles, and of things which might have been procured more cheaply in the colony itself.' It is indeed surprising that, in spite of the warnings to the contrary, repeatedly and earnestly given in works addressed to intending emigrants, this folly of providing an expensive outfit of articles which can be purchased to much better advantage in almost any colony, should still be so frequently committed.

It had been the intention of the author and his brothers to invest their capital entirely in sheep, and 'retiring into the bush for some six or seven years, to gradually accumulate a large flock, the produce of which would soon have afforded a handsome income;' the injudicious restrictions, however, which the home and local governments have imposed on the acquisition of land, compelled them to renounce this project. His brothers took a farm at a high rent, 'and wasted their capital upon objects that would never bring in a good return.' The doctor, however, seems to have resumed the practice of his profession, as did likewise the author himself; while the only one who actually carried into effect his original intention of leading a shepherd life, was the younger brother, who, in consequence, figures throughout the book, and very amusingly, under the pastoral cognomen of Melibœus.

Mr Landor's impressions of the colony, and of colonial life in general, do not seem to have been very favourable. He considers, indeed, that Western Australia, or

* *The Bushman*, &c. By H. W. Landor. London: Bentley, 1862.

'Swan River,' is quite equal, if not superior, in natural advantages, to other portions of that continent about which much more has been said and written. The climate is most salubrious, and proves wonderfully restorative to constitutions weakened by diseases of either the respiratory or the digestive organs. The soil is, in general, as throughout Australia, rather indifferent; some districts, however, are tolerably fertile, and others are well adapted for pasturage. Provisions are cheap, indeed too cheap for the cultivator's interest; while manual labour is scarce and dear. To a really poor man, who is willing to work, and desirous of emigrating, Western Australia would seem to offer many inducements. Its great disadvantage, in the author's opinion—and one which, as he considers, it shares in a greater or less degree with all colonies—is its poverty. The colonist has either no market, or at best a very uncertain one, for his surplus produce. He may have a substantial dwelling, abundant crops, numerous flocks and herds, and plenty of good homespun clothing; but while he wants those elegancies and luxuries which can only be procured from abroad, he is, and must remain, a poor man. From this account, it will be seen that the author's ideas of poverty are those of a class, and that not the class to which the majority of emigrants belong.

The following picture, however, of 'country life' at Swan River, among the class of settlers especially referred to, does not by any means convey an impression of very severe privations to be endured by such emigrants. It is a description of the fireside of a 'half-pay officer or gentleman farmer,' who, though occasionally driving his own cart, or sowing the seed which he has purchased in the market, 'is not thought less qualified to act as a magistrate, nor is less respected by the great and small in his neighbourhood.' 'Happy family!' exclaims the author, 'how pleasantly the evenings pass in your society! Gladly would I ride many miles to spend such pleasant hours, and witness happiness so unpretending and real. How cheerful looks that large room, with its glorious fire of jarra-wood and "black-boys" (for it is the winter season), and how lightly those young girls move about, arranging the tea-table, and preparing for the evening meal! The kind-hearted mother, relieved of all duties but that of superintendence, sits by the fire, chatting cheerfully with the guest, whose eyes, nevertheless, wander round the room after a certain light and dancing shape; the host, a man of old, but stalwart in appearance, full of hospitality and noble courtesy, appears in his easy slippers and an old and well-worn coat, which formerly had seen service in London ball-rooms. He discourses not only of the crops, and colonial politics, but of literature, and the last news from England; for, like many other colonists, he receives the English papers, and patronises the quarterly reviews.

'With what alacrity the old gentleman rises up and welcomes a traveller, who has unexpectedly arrived, and has just stabled his horse, and seen him fed before he made his appearance in the parlour. There is no beating about the bush for a bed, or an invitation to supper. Of the latter he is certain, and indifferent about the former; for having slept the last night under a tree, he feels sure of making himself comfortable on the sofa, or on the hearthrug before the fire. During the evening, the girls sing, and happily they sing well; and they take most pleasure in those songs which papa likes best to hear: and the poor bachelor guest, who looks on, feels his heart melting within him, and reviles himself for the destitution in which he lives at home. Suddenly, perhaps, horses at a gallop are heard to enter the yard; and soon afterwards two young fellows, fresh from the capital, come dashing into the room, full of

spirits, and vowing they have galloped over on purpose to ascertain whether the ladies were still living. Here is authority of undoubted value for everything relating to the last ball at Government House; and the merits and appearance of every person who attended are soon brought under discussion. This naturally inspires the young people with a desire to dance; so the table is pushed aside, and papa being squeezed nearly into the fire, mamma takes her place at the piano, and bursts off with the "Annen Polka."

There are some entertaining chapters descriptive of the exciting pleasures of wild-cattle hunting, the chase of the kangaroo, and similar sports. Other portions of the work afford useful information respecting the climate and productions of the colony, the local government, the aborigines, and various other subjects of interest to emigrants. We prefer, however, as more closely bearing upon the avowed object of the work, the account of a visit which Mr Landor paid to his younger brother, the Shepherd Melibœus, 'at a "squattening station" on the Hotham, some sixty or seven miles south of York.' 'In the afternoon of the second day after leaving York,' continues the author, 'we descended into a broad valley, abounding with grass and scattered gum-trees. A large flock of sheep were being driven towards the bottom of the valley, where we could discern signs of human habitation. On arriving, we found a hut built of piles or stakes, interwoven with boughs, before the door of which was a fire, with a large pot upon it, from which a powerful steam arose, that was evidently very grateful to a group of natives seated around. On descending from the vehicle, and looking in at the hut door, we perceived, lying in his shirt sleeves, on a couch composed of grass-tree tops covered with blankets and a rug made of opossum skins, the illustrious Melibœus himself, with a short black pipe in his mouth, and a handsome edition of "Lalla Rookh" in his hand. Perceiving us, he jumped up, and expressing his loud surprise, welcomed us to this rustic "Castle of Indolence."

'When a large flock of sheep is sent into the bush, and a squattening station is formed, the shepherds take the sheep out to pasture every morning, and bring them home at night, whilst one of the party always remains at the station to protect the provisions from being stolen by the natives; this person is called the hut-keeper. His duty is to boil the pork or kangaroo-flesh, and provide supper, &c. for the shepherds on their return at night. Melibœus, who superintended this station, undertook the duties of cooking and guarding the hut whenever he did not feel disposed to go out kangaroo-hunting, or shooting wild turkeys or cockatoos. In all things, sports or labours, the natives were his daily assistants, and in return for their services were rewarded with the fore-quarters of the kangaroos killed, and occasionally with a pound or two of flour. There were some noble dogs at this station, descendants of Jezebel and Nero; and my brother had a young kangaroo, which hopped in and out with the utmost confidence, coming up to any one who happened to be eating, and insisting upon having pieces of bread given to it. Full of fun and spirits, it would sport about as playfully as a kitten; and it was very amusing to see how it would tease the dogs, pulling them about with its sharp claws, and trying to roll them over on the ground. The dogs, who were in the daily habit of killing kangaroos, never attempted to bite Minny, which sometimes teased them so heartily, that they would put their tails between their legs and fairly run away.'

It will be sufficiently apparent that 'The Bushman' is not exactly a work in which a really poor emigrant, taking that term in its usual sense, will find the information best suited to his circumstances; there is, however, a large class of 'poor genteel' individuals, who are painfully struggling, with insufficient means, to maintain themselves in the sphere to which they have been accustomed, and whose poverty, if not as real, is as keenly felt as that of many, with much smaller incomes

and humbler pretensions. To such, 'The Bushman,' notwithstanding its somewhat ambitious and over-laboured passages, will be found to contain matters both of instruction and entertainment.

THE SOCIETY FOR THE IMPROVEMENT OF THE LABOURING CLASSES.

PERHAPS few of the readers of the Journal are aware of the existence of the society whose name is written at the head of this paper. It has, however, been in active operation for the last two or three years, having its head-quarters in London, and numbering among its most vigilant promoters Lord Ashley, the Bishop of London, the Bishop of Norwich, the Rev. Sir Henry Dukinfield, rector of St Martins; the Hon. and Rev. Montagu Villiers, and several other noblemen and gentlemen. With the laudable object in view which its title imports, we purpose now to state what the society proposed to do at its outset, what it has been able to do, and what it has failed to do. The writer of this paper had the opportunity of gathering this information at a late anniversary meeting of the society, held at the new model lodging-house in St Giles's (to which we shall shortly advert), and which was attended by the several gentlemen whose names we have enumerated, and many others interested in the society and the object for which it was instituted.

The acting committee of the society arranged their operations under three heads; namely, to aid the labouring classes in three important particulars—those of money, land, and dwellings. With regard to the first point, the committee 'had seen and lamented from the commencement that in either the borrowing or saving of money, the poor man had scarcely any of those facilities which were so abundantly within the reach of the middle classes. He had to pay 15, 20, and 25 per cent. for loans of money; and the benefit societies of which he was a member too often dissolved themselves before he could reap any advantage from the sums he had deposited with them.' With the view of obviating these inconveniences, the committee set on foot a loan-fund, which failed, however, to answer the end intended by its formation. They thus explain the cause of its miscarriage. 'In their institution of a loan-fund, they have seen it to be as yet impossible to overcome the difficulties peculiarly incidental to the metropolis. In a village or a small town, where the real character, habits, and probable means of every poor inhabitant can be easily and quickly ascertained, there is little difficulty in the management of such an institution; but in London—where every office for granting pecuniary aid is sure to be instantly thronged by a crowd of persons of doubtful character, and whose real objects cannot be easily penetrated, and who, in this vast metropolis, find so difficulty in concealing themselves from their creditors whenever their claims begin to prove inconvenient—such an institution is beset with serious difficulties.' The committee, unwilling to give up this part of their purpose, turned their attention to the institution of what they call a model benefit society; but here again an unexpected difficulty arrested their progress. They consulted several eminent actuaries as to the scale of payment which might safely be adopted, but those actuaries differed greatly from each other on this important point. 'Under all these circumstances, the society has not yet been able to determine on any distinct and eligible course of action in this matter.' 'Nevertheless,' said Lord Ashley, who acted as chairman, 'we shall continue our efforts on this point, in the full hope that we shall be able, before our next anniversary, to state something satisfactory on the subject.'

It occurred to us that, so far as the saving of money among the poor was concerned, instead of the society

setting on foot an institution like their model benefit society, the object they had in view might have been served if they had endeavoured to diffuse among the working-classes the advantages which the ordinary savings' banks offered for parties who had the opportunity and the wish to save money, the savings' banks being far superior to any private and kindred institution that we know of, especially in the unexceptionable security which they give to depositors for the safety of their savings.

With respect to providing the labouring classes with allotments of land, this is an object to which the society attributes much importance, and they have been at great expense and trouble in promoting it. On this subject Lord Ashley observed, that he believed the society had brought the public mind throughout the country to the conviction, that few things could so well conduce to the welfare of the agricultural population as the allotting to them portions of land to cultivate in their hours of leisure. The society itself, he added, had a very considerable portion of land allotted in that way; and they would continue that system of things, not only because it was part of the foundation of their society, but because it would be a proof of their conviction that it was most conducive to the welfare of the labouring classes. The Bishop of London added his testimony to the importance of this subject. He said the question of allotments was one in which he took a very deep interest, and the meeting would readily believe him when he said he was one of the first, if not the first person, to introduce the system into an agricultural community more than thirty years ago. He allotted certain portions of land to a number of labourers, and the only fault which he committed was in allotting to each labourer too large a portion of land. The good effects, however, of such a system, he was of opinion, could not be extensively felt throughout the country unless it was taken up by the proprietors of land; at the same time the society had done wisely in fixing at different parts of the country model allotments, in order that the success which would infallibly attend them might stimulate others in the same practice. The Bishop of Norwich also stated that twenty-five or thirty years ago he endeavoured in every possible way to introduce the allotment system. When he went to Norwich, he tried it there; and he was happy to say the system was answering perfectly well in that great and populous town.

On this subject we would only observe, that allotments of land are valuable merely when intended for cultivation, as Lord Ashley observes, at leisure hours. If the people are induced to depend solely upon such allotments, the result, as all experience demonstrates, will be deterioration and pauperism.

A few words as to the localities in which the society are endeavouring to carry out the allotment system. Previous to the annual meeting of 1846, they were in possession of land for that purpose at Yetminster in Dorsetshire, at Talworth and Long-Dilton in Surrey, at Herne Bay in Kent, at Winchmore Hill and Edgeware in Middlesex; and at that time the society was in treaty for the purchase of ten acres of a charity estate situate at Cholesbury, near Tring. This latter piece of ground has since been put under the superintendence of the Rev. H. P. Jeston, and at Michaelmas 1846 sixteen tenants were admitted to allotments, 'to their great gratification (as the committee observe), and with every prospect of permanent benefit.' The society has also taken possession of twenty acres of land at West Malling, the whole of which has been divided into allotments. Upon this estate the committee contemplate the building of two model cottages for labourers. They have also obtained a piece of land, part of a charity estate, at Denton in Northamptonshire, which has been divided among sixty-four tenants. They have likewise purchased a piece of land at Chatham, consisting of eleven acres, but they had not, at the time of the meeting, obtained possession of it.

The report of the committee was almost entirely silent as to the result of their exertions to establish the allotment system; at least they entered into no details upon that point. We could not help thinking that circumstance indicative, if not of the failure, at least of the partial or small success of the project. We had expected to find some reference made to the effects produced by the allotment system upon the occupants, or some contrast drawn between their former and present condition, or between them and the class of labourers who have not hitherto participated in this way in the society's bounties; but none such was ventured, and we could not avoid the conclusion, that the beneficial results expected by the society from their exertions in this direction were problematical, and had yet to be proved.

We shall now advert to the third object of the society's solicitude—namely, the improvement of the dwellings of the labouring classes; a point, as it appears to us, the most feasible of all their exertions, and one in which they have been most successful so far. Their efforts in this department, however, have as yet been confined chiefly to the metropolis, from the difficulty they have experienced in obtaining sites, and in carrying on building operations in distant parts of the country. At the time of their annual meeting in 1846, the society had just completed a range of buildings near Gray's Inn Road, for the accommodation of working men and their families, a portion of the range being devoted to poor widows and single women. Those buildings, the erection of which cost the society several thousand pounds, were opened in the spring of 1846, and, excepting three of the tenements, have been upwards of a year occupied. The gross rental is somewhere about L.400 per annum, and at the time of the last meeting, a sum of L.7, 14s. 0d. only remained unpaid by the tenants. The committee do not state the terms on which these premises are let; we presume they are more than ordinarily reasonable.

The committee were of opinion that much good might be done to benefit the poor by taking some of their present dwellings on lease, and effecting a thorough reform and improvement of them. In King Street, Drury Lane, a house, usually occupied as a lodging-house, fell into the possession of Mr Russel Gurney, an eminent counsel at the English bar, who determined upon a thorough reformation of it. After being entirely repaired, and made clean and wholesome, it was used as a lodging-house at the usual charge of 4d. a night, and has for many months past been fully occupied with lodgers to the number of twenty-four, the whole that it could accommodate. It is now under the charge of the society. In the summer of last year, the society was offered seventeen dilapidated houses in two or three different parts of London, out of which they selected three houses lying together in Charles Street, Drury Lane, a district where lodging-houses for the lowest class of labourers most abound. They took a lease of those three houses, at a rent of L.45 per annum for the three, and, from first to last, they have expended nearly L.900 in repairing, rebuilding, and furnishing them, and in constructing baths and various other conveniences. They provided eighty beds. The house was opened for lodgers, at 4d. a night, on Monday the 31st May last—and on that night only eight poor people lodged there. On the 3d of June there were thirty-five; on the 7th of June, forty-nine; on the 9th, fifty-nine; and on the 10th, sixty-six—being the whole number that the house was then capable of receiving.

We come now to speak of the New Model Lodging-House in St Giles's, which has been erected under the auspices of the society, and to which they refer with just pride, though it was not in operation at the time of the meeting. The site of this structure, which is in George Street, St Giles's, and contiguous to the French Protestant church there, cost the society L.1200; the builder's contract was L.3930; and it is destined to accommodate 104 inmates, at

a charge of 4d. per night, or 2s. per week, which, assuming it is fully occupied, will yield a return of L.540 per annum. The structure is plain and neat in its design, is built of brick, and consists of five storeys, besides underground apartments. The basement storey is intended for the residence of the master and matron. The underground apartments are to be fitted up as kitchens and larders, in which the lodgers are to be furnished with fire, and every necessary implement for cooking and keeping their victuals. A hundred and twelve beds in all, each intended for the accommodation of one person, and contained in a distinct apartment, will be provided within the walls. Each of the dormitories contains twelve of those separate apartments, divided from the adjacent ones by wooden partitions, with efficient arrangements for warming and ventilating them. Each of the sleeping apartments is also provided with a small wooden chest, having a lock and key, in which the occupant of the room may put and leave anything secure during his absence in the day. To each dormitory is attached a wash-room, lighted with gas at night, and fitted up with a series of leaden wash-hand basins, and towels mounted upon rollers, with an arrangement for supplying and carrying off the water with scarcely any trouble. There are also arrangements for providing the lodgers with warm and cold baths on the premises. Besides all this, there is a large, well-lighted, and well-ventilated apartment set apart as a coffee and reading-room, and fitted up with suitable benches, to which the inmates may repair for innocent and agreeable recreation before retiring to rest. Eventually, a library is intended to be added to the accommodation afforded.

The advantages of the institution are limited exclusively to single men, for obvious reasons. The great object of the establishment is to afford to poor single men comfortable lodgings, and the means of cleanliness, in such a manner as that they shall no longer have their feelings unnecessarily offended by being compelled to herd in common lodging-houses with people of vicious character and lives, as thousands of well-disposed poor persons are driven to do in this great world of London, whose straitened means admit of their obtaining no better quarters, confirming the old adage, that 'misery makes men acquainted with strange bedfellows.' We cannot help expressing a hope that the society may be induced to turn its attention to providing poor destitute single women with some kindred shelter and accommodation. It is difficult to say how much of good would result from their doing so; how many poor and defenceless, and homeless young women it would rescue from ruin, to which they are constantly exposed by the want of anything like a comfortable roof under which to lay their head at night in this great city. To return to the Model Lodging-House: the accommodation and comfort which it holds out are offered to the recipients at the reasonable charge of 4d. a night, or 2s. a week, that being the charge at all the common lodging-houses in St Giles's. But how much superior are the advantages in the former! When one thinks of the having all the means and facilities for washing, bathing, and cooking their food—above all, each man having a separate apartment and a separate bed to himself—we cannot hesitate, nor will the poor hesitate, which to give the preference to; whilst the consideration leads us to infer the happiest moral and social results from an institution begun and carried out on such principles. Already the kindred establishment set on foot by the society in Charles Street, to which we have adverted, has had a collateral effect not previously taken into account by its founders—namely, that of inducing the private lodging-house keepers in the neighbourhood, in order to enable them to compete with it, to improve the accommodation which they have heretofore afforded to their guests, and to rival the efforts of the society in this respect as much as possible. Upon the whole, we cannot but augur the happiest results from the New

Model Lodging-House, planted as it is in the very heart of the dense and squalid population congregated in the district about St Giles's.

A SCOTTISH MUSICAL GENIUS.

Is a late number of the 'Inverness Courier' we find an interesting notice of one of the more fertile composers of our national airs—the late Mr William Marshall, a farmer in the north of Scotland. Any notice of this kind should not be suffered to pass without attracting a proper share of attention. It is the misfortune of Scottish music that absolutely nothing is known of the authors of the most beautiful and popular airs: of the origin of many tunes, which are the delight of every domestic circle, there does not appear to exist the slightest tradition. They have sprung up in the course of ages, and been incorporated in the national music, without exciting any remark at the time, and afterwards the authorship has silently passed into oblivion. In numerous instances, we believe, the composers have been persons moving in no high sphere of life—not finished musicians, in the proper sense of the term, but geniuses inspired with an ardent love of melody, whose name and merits have scarcely travelled beyond the bounds of a limited rural range.

The subject of the notice in question was one of these geniuses. William Marshall, proceeds the narrative, was born in Fochabers, Banffshire, in 1748, and was the third son of a large family in humble circumstances. While a boy, he evinced considerable musical talent, which, if cultivated, might have shone out with lustre; but this was not possible, and all the education of any kind he received was six months at school, and a few extra lessons he received from a gentleman at Gordon Castle. 'At twelve years of age he entered the service of the Duke of Gordon, and in a few years was elevated to the post of house steward and butler. In this situation he remained for thirty years, accompanying the family wherever they went. Marshall also displayed a taste for architecture, astronomy, mathematics, and mechanics, and in all these sciences he made astonishing progress. Land-surveying was a favourite amusement; and in later years he laid down meridian lines upon which he built the houses of Keithmore and Newfield. Of his mechanical skill he has left a wonderful evidence—a clock he constructed and presented to the Duke of Gordon, which indicates the months and days of the year, the moon's age, the sun's declination and time of rising and setting daily, with many other astronomical phenomena. This curious clock is preserved at Gordon Castle.

Marshall was above the middle size, compactly built, and handsome in his youth. He was, as we may easily believe, an excellent dancer. He understood the craft of fiddery, was an excellent angler, could throw the hammer, leap, and run with a dexterity, agility, and speed, against which few could successfully cope; and, to add to his extraordinary doings, in his age he made roads, constructed bridges, and administered the law of the land. It is as a musician, however, that we have more immediately to deal with him. At Gordon Castle he employed his leisure in the practice of his favourite art, and among his earlier compositions were "The Duke of Gordon's Birthday," "The Bog of Gight," "Miss Admiral Gordon," and "Johnie Pringle." To the last, the facetious author of "John o' Badenyon" set the song "Tune your Fiddles;" and to "Miss Admiral Gordon," Burns wrote the words "Of a' the airts the wind can blaw." The air is one of the sweetest in the whole range of Scottish melody; and it is united to one of the tenderest of lyrics: both became at once, and have ever continued, universal favourites. Like the songs of Burns, Marshall's airs were all the result of mere momentary whim or fitful inspiration. They cost him no labour; and when once he had mastered the rhythm, it is said he seldom retouched it. He did not trust wholly to his own partial judgment. At the age of twenty-five he had married "a winsome wee thing," by name Jane Giles—who, although no musician, possessed a fine natural taste. That taste was the ordeal he chose for his airs. In the evenings he would take his fiddle, and while she listened, he would go over with a delicate hand the air he had composed during the day. If she disapproved of it, the piece was rejected; what she admired, he instantly committed to

paper. In this way Marshall selected and preserved upwards of three hundred airs. Latterly, however, and when a very old man, we find him throwing off melodies so rapidly, that we can scarcely think he was as fastidious as in his younger days. As a performer on the violin, Marshall was a master. His correctness of ear was extreme; his management of the bow perfect; his style at once precise and full; and his execution brilliant. As a performer, he became even earlier known than as a composer. He was on one occasion dining with a party of friends, when a blind minstrel—probably more a lover than a master of his instrument—came under the dining-room windows and began to play. By way of a joke, one of the company told him that one of the party was a learner; and as he (the blind man) had delighted them, it was right that the "loon" should give him a bar in return, although it might neither be sweet nor tender. The old man handed up his instrument; Marshall good-naturedly took it, and played several strathspeys in his own perfect way. When asked what he thought of the learner's "quality," the old man earnestly replied, "Na, na! that's no a 'loon's' playing; I'll wager a groat that's Mr Marshall o' Keithmore, for there's naeboddy hereabouts that could play like that but him!" When Marshall played strathspeys, the inclination to dance was as irresistible as if the listener had been inoculated by the Tarantula. In his compositions—no matter by whom performed—there was a charm almost equally powerful. Writing from India in 1822 to Mr Marshall, Mr John Stewart of Belladrum humorously remarked, that "though he thought his dancing days were over," yet, in the house of a lady, both he and Mrs Stewart had danced to some of his strathspeys "with the thermometer at 85 degrees."

Marshall left Gordon Castle in 1790 for a farm near Fochabers. Shortly afterwards, he removed to a larger, Keithmore, and was appointed factor by the Duke of Gordon, from whom the farm was held. The situation of factor he filled until 1817. From his earliest connection with the Gordon family, Marshall was held in the highest estimation. Similarity of taste led to an early friendship between him and his Grace; and time, as it went, revealed so much and so varied talent, with such private worth, that Marshall advanced higher and higher in the esteem of his patron the duke. His personal merit procured him respect—his musical powers constant admiration. At Gordon Castle, the fruits of his genius were always first displayed and appreciated; and from the hall they rapidly spread into every corner of the district, and latterly over the land. With the extension of his works his popularity increased, until it reached London itself, where, in the Opera House, several tunes of his became favourites. It was no longer left to him to give the name of some imaginary gentle one, or fanciful title to his compositions. He ran no hazard in coupling with his strains the names of the noblest of the land; for the fair sex of the higher classes paid the composer considerable attention, and were emulous of having their names united to his melodies. As his years increased, so did his popularity; and in his later correspondence, scarcely a tune is embodied for the name of which he had not been solicited long before. In the collection of his hitherto unpublished airs, for example, only three out of upwards of eighty tunes occur to which the name of some fair creature or noble personage is not attached. Frequently, and long after Marshall left Gordon Castle, his music was heard in its halls. The duke still acknowledged the charm of his compositions; and frequently Marshall's successor (Daniel Macdonald, also a composer and performer), and the musical retainers, were called upon to perform his music to his Grace's guests. The duke, of all Marshall's tunes, had one particular favourite—"The Marchioness of Cornwallis;" and he showed his partiality for it on such occasions by calling specially for it as the wind-up of the entertainment.

Marshall was repeatedly urged by his noble patron to collect his compositions for publication, but without effect. Unlike the common herd of composers, whose notions are everlastingly of *copyright*, and who tremble at the idea of one of their airs being played in public without a *consideration*, Marshall—as Burns had done with his lyrics—threw off his airs without a thought as to personal remuneration, and could with difficulty be persuaded to give them to the world in a regular collected form. 'At length, when many of them had become known and admired, his reluctance was overcome by the duchess, to whom all lovers of Scottish melody must feel indebted. The first volume ap-

peared in 1822, and contained about 170 original airs. To this work there were 600 subscribers, many of whom put down their names for ten, fifteen, and twenty copies; and among these the Gordons were thickly interspersed. The composer was now in his seventy-fourth year. From Keithmore he then retired to a cottage called Newfield, which he had built for himself, near Craigalachie Bridge. Having made an arrangement with the late Mr Alexander Robertson, music publisher, Edinburgh (now carried into effect), for the publication of a supplement, or second volume, at some future period, Marshall continued the pleasing task of composition, scattering his melodies in profusion. Often the old man thought of hanging his harp on the willows; but with the importunities of his fair admirers, or when his soul would fain have expression as before, the desire was as often overcome, and the old strings struck anew. Shortly after removing to Newfield, he wrote to Mr Robertson as follows:—"I enclose twelve or thirteen reels to help up your supplement; but as I have no copies of the spare ones that I left with you, I cannot tell if I have encroached on any of them." So little of self-sufficiency was in the heart of the veteran, that he adds, "You will therefore examine them, and leave out what you think improper, or alter any passages that you may think by doing so can be improved." In the occasional excursions which he made at this period to Edinburgh, he seldom failed to attend the theatre, to revel in the fine strains of the band led by the late Mr Dewar, who was himself a composer, and had arranged many of Marshall's airs. Placed beside the leader, Marshall enjoyed the sweet performances of the finely-trained band, and Mr Dewar seldom failed to give one or two of the aged composer's own and favourite compositions. On one occasion he felt so delighted with the accompaniments to his air "Of a' the airts the wind can blaw," that it was repeated at his own request. No one who heard Mr Dewar and his band perform such melodies as "The wind blew the bonnie lassie's plaidie awa," or "This is no my ain house," can doubt the effect which his own beautiful melody, executed with such care, taste, and power, would have on Marshall's delicate ear. The last letter he wrote respecting his new volume was in 1830, when he was in his eighty-second year; and three years afterwards, in his eighty-fifth year, in the month of May, when all was harmonious around him, he ended the journey of life. He was buried beside his forefathers and his wife—who predeceased him in 1825, at the same age—in the churchyard of Bellie.

Marshall left five sons and one daughter. Only one son—the third—survives, who is now Colonel William Marshall. The eldest son, Alexander, became a major in the East India Company's service, and died at the age of thirty-nine, in 1807, at Keithmore, having returned home in bad health after the siege of Seringapatam. The second was a jeweller in London, but he, too, retired from bad health. The fourth, John, captain in the 26th foot, died in 1829 at Madras; the fifth, Lieutenant George, in Spain, in 1812. The only daughter married Mr Macinnes, Danda-lieth, and in her family is a magnificent portrait of her father, painted by Moir at the command of the Duke of Gordon, and since presented to Mrs Macinnes by the Duke of Richmond. Marshall, as a musician, had no claim to the same rank as the Mozarts and Handels. He knew little of the grander effects of harmony. He was a thoroughly native genius. His taste, his inspiration, the current of his thought, were all imbued with the spirit of the old Scottish minstrels—that spirit, which, borrowing no more than it lent, gave a character distinct and beautiful to the music of our country. His melodies were at once natural, original, and effective: for strathspeys, Burns called him "the finest composer of this age." With him sleeps the cunning of the craft—he was the last of the band of the pure, enthusiastic, prolific Scottish composers.

DEVELOPMENT OF VEGETABLE LIFE.

The progress by which the surface of the earth becomes covered with vegetable life is sufficiently curious to merit some of our attention. Let us suppose the bare surface of a rock under the action of those changes which all bodies exposed to atmospheric influences undergo. In a little time we shall discover upon its face little coloured cups or lines, with small hard disks. These at first sight would never be taken for plants, but on close examination they will be found to be lichens. These minute plants shed

their seed and die, and from their own remains a more numerous crop springs into life. After a few of these changes, a sufficient depth of soil is formed, upon which mosses begin to develop themselves, and give to the stone the first faint tint of green, which, although a mere film, indicates the presence of a beautiful class of plants, which, under the microscope, exhibit in their leaves and flowers many points of singular beauty. These mosses, like the lichens, decaying, increase the film of soil, and others of a larger growth supply their places, and run themselves the same round of growth and decay. By and by fungi of various kinds mingle their little globes or umbrella-like forms. Thus, season after season, plants perish and add to the soil, which is at the same time increased in depth by the disintegration of the rock over which it is laid, which is quickened by the operations of vegetable life. The minute seeds of the ferns floating on the breeze now find a sufficient depth of earth to germinate in, and their beautiful fronds eventually wave in loveliness to the passing winds. Plants of a higher and a higher order gradually succeed each other, each series perishing in due season, and giving to the soil additional elements for the growth of their own species or those of others. Flowering plants find a genial home on the once bare rock; and the primrose pale, the purple foxglove, or the gaudy poppy, open their flowers to the joy of light. Eventually the tree is seen to spring from the soil; and where once the tempest beat on the bare cold rock, is now the lordly and branching tree, with its thousand leaves, affording shelter from the storm for the bird and the beast.—*R. Hunt in Pharmaceutical Times.*

GOOD AND BAD LUCK.

I may here, as well as anywhere, impart the secret of what is called *good and bad luck*. There are men who, supposing Providence to have an implacable spite against them, bemoan, in the poverty of a wretched old age, the misfortunes of their lives. Luck for ever ran against them, and for others. One, with a good profession, lost his luck in the river, where he idled away his time a-fishing, when he should have been in the office. Another, with a good trade, perpetually burnt up his luck by his hot temper, which provoked all his employers to leave him. Another, with a lucrative business, lost his luck by amazing diligence at everything but his business. Another, who steadily followed his trade, as steadily followed his bottle. Another, who was honest and constant to his work, erred by perpetual misjudgments—he lacked discretion. Hundreds lose their luck by indoring, by sanguine speculations, by trusting fraudulent men, and by dishonest gains. A man never has good luck who has a bad wife. I never knew an early-rising, hard-working, prudent man, careful of his earnings, and strictly honest, who complained of bad luck. A good character, good habits, and iron industry, are impregnable to the assaults of all the ill luck that fools ever dreamt of. But when I see a tatterdemalion creeping out of a tavern late in the forenoon, with his hands stuck into his pockets, the rim of his hat turned up, and the crown knocked in, I know he has had bad luck—for the worst of all luck is to be a sluggard, a knave, or a tippler.—*Lectures to Young Men, by H. W. Beecher.*

OCCUPATION FOR CHILDREN.

The habits of children prove that occupation is of necessity with most of them. They love to be busy, even about nothing, still more to be usefully employed. With some children it is a strongly-developed physical necessity, and if not turned to good account, will be productive of positive evil, thus verifying the old adage, that 'Idleness is the mother of mischief.' Children should be encouraged, or if indolently disinclined to it, should be disciplined into performing for themselves every little office relative to the toilet which they are capable of performing. They should also keep their own clothes and other possessions in neat order, and fetch for themselves whatever they want; in short, they should learn to be as independent of the services of others as possible, fitting them alike to make a good use of prosperity, and to meet with fortitude any reverse of fortune that may befall them. I know of no rank, however exalted, in which such a system would not prove beneficial.—*Hints on the Formation of Character.*

DEBT AND BANKRUPTCY.

THE insolvent debtor among the Romans was cut to pieces and distributed among his creditors. Even in England, the bankrupt was treated as a criminal, and subjected to the personal punishment of imprisonment. In Scotland, till a hundred years ago, they set the 'dyvour' upon a pillory, with stockings of various colours, to subject him to the scorn of the multitude. All these are traits of the natural sense of mankind regarding the immorality of insolvent debt. Recognising it as a positive encroachment upon each other's rights and property, they are disposed to punish it accordingly. We are indebted to two things for the change of public sentiment about insolvency—increased humanity, and the new aspect which debt assumes when it is contracted in the course of commercial transactions. We are now no more inclined to be severe with debtors than with others who injure us. The bankruptcy laws have partaken of the amelioration of the criminal code generally. We now trust for our protection here, as against more violent offences, more to the moral influences working in society, than to the vengeance of the law. And when we become familiarised, as we are, with mercantile engagements, in which all are debtors and creditors by turns—not that we may live upon another's means, but because of a mere conveniency in the transacting of business—we cease to regard such obligations in that personal light in which they were once contemplated. Failures to fulfil engagements appear as only the effects of miscalculation or mischance. And then that sense, that what may be your turn to-day may be mine to-morrow, makes us 'wondrous kind.' It is like the Irish small farmer being so gracious to the poor wayfaring beggar, because he does not know but what it may be his own fate next winter. It is a case proved by exceptions; for where is it that bankruptcy is still beheld with the greatest share of the ancient horror?—Always in primitive communities, such as little country towns, where no complicated business engagements exist.

But indiscriminating humanity and commerce may carry us too far in our changed views regarding debt and bankruptcy. At least it appears as if very culpable cases were sometimes looked on somewhat too leniently, and as if some of the salutary checks which formerly existed would now be well resorted to. Some discrimination regarding various kinds of insolvents is needed; and there might even be some improvement counselled as to our ordinary ideas regarding the purest of commercial bankruptcies.

When a person in private life, with an ascertainable income, and liable to no risks which can damage his resources, is found short of means to liquidate his obligations, what should we say of or do to him? We may

not choose to inflict any tangible vengeance—we may give him the benefit of that meekness of judgment which would speak tenderly of all human infirmity; but undoubtedly this person has been guilty of a great fault. He has committed a practical aggression on the rights of his neighbours. He has either done this from undue love of his own gratifications, or from a recklessness about his affairs which every reasonable person knows cannot be indulged in without the greatest danger. Society ought not to forgive it too easily. Such a person is not entitled to stand exactly on the same platform of moral repute with those who keep clear of debt. So society will say in its cool moments; but, unluckily, one of its perverse sympathies interferes with the maintenance of the principle. Men in the mass feel for the poor and embarrassed, and *against* the rich or those who have enough. Very often those who fall short are easy-natured, kind-hearted men, and therefore popular. Persons in the opposite circumstances often are of hard character—not general favourites. Then our selfhood is more soothed in looking on a downcast or outcast person, than on one who stands in all the pride of independence. Thus it comes about that society never visits debtors of this class with the full punishment which, as guilty of an infraction of rights, they deserve. It might be different if we were to get quit of the fallacies which beset the case. Creditors are not necessarily either rich, or hard, or self-sufficient, but often very much the reverse. Neither are debtors always necessarily generous: having used their neighbours' property for their own benefit and indulgence, it may fairly be inferred of them that they are fully as likely to be selfish. But we cannot, it will be said, shake off fallacies resting on sympathies so deeply founded in our nature. Then our sufferings from foolish and unprincipled debtors are the penalty which we must pay for our absurdity. Let not debtors, however, exult too much in the privilege, or take too much advantage of it. It is, after all, but pity which is extended to them—a sentiment whose associations are in no good savour in human experiences. Nothing can save debt from the stamp which destiny has put upon it—degradation. The reckless may therefore feel assured that, in the long-run, it is somewhat better to be over an equality with the world than below it.

In commercial insolvency there is a less direct appearance of selfishness in the debtor, in as far as the articles for which the debt was contracted are not for objects of domestic consumption or personal gratification. The culprit seems only a loser in a game of chance. Things have gone against him. He has met with losses. The very machinery, so to call it, of business blinds us somewhat to the position he is in. We only see so many ruled books of accounts, and little slips of inscribed paper. We only hear of 'state of the money market,'

acceptances, returned paper, assets, dividends, and other terms more metaphysical than real. It is difficult, particularly when the transactions are of large amount, to connect the case with human passions, error, and trespass. Yet even here the moralist may come in with his rebukes and warnings. The aim of the commercial man in the contracting of his obligations is, after all, a selfish one; he intends, by the results of such transactions, to obtain exactly those tangible indulgences which have brought his non-commercial neighbour into debt. It is, in the world's morality, legitimate to follow this object with one's own means and industry; but it never can be so to follow it by means of the property of another man. Such is the case of him who trades chiefly upon means not his own; who, in other words, trades largely upon credit. If A B, for example, possessing property to the value of only five thousand pounds, orders foreign corn to the amount of fifty thousand, in the hope of making fifteen thousand by it, while there is a chance on the other hand that, by a fall of markets, it may only sell for thirty, he undoubtedly is risking a loss of fifteen thousand pounds to his creditors for the chance of making as much for himself. Rightly judged, this is an unprincipled action—as much so as to commit positive larceny. Yet, sad to say, this is the system pursued by a vast proportion of commercial men. All trading beyond a proper substratum of means is only a kind of masked profligacy—unless, indeed, credit is pushed upon a man by others, who have their own selfish objects in view; in which case the insolvent may be as much the sinned against as the sinning. We were lately told of mercantile houses which had not been in a position to pay all their debts within the memory of any person; yet the partners had been living in handsome style, upon these ventures of the means of others, during a series of generations! What a false and hollow life! It could never find one voice to justify it, if there were not so many involved in some degree in the turpitude. One painful consideration is, that many, if they would keep to their own means, might be prosperous and happy; but unable to rest satisfied with moderate doings, they rush into the difficulties consequent upon credit, and thus make for themselves great reverses. It appears as if some men had such a liking for embarrassment as others have for opium or brandy, and never could be at rest except when tossed about in a forest of dilemmas. Talk of the frivolous lives of the ultra-gay, of the unhealthy lives of the poor, but what can be more forced, unhealthy, or unnatural, than the life of one of these insatiables of the business world, who rush from speculation to speculation, as if to gratify a morbid love of excitement, and, in the absorbment of their daily avocations, forget nearly every domestic tie?

It surely might be possible to make the proper allowance for the bankruptcies occurring through inevitable misfortunes, and yet be sufficiently alive to the nature of those cases in which there had been no right substantial basis of means from the beginning, or where business had been persevered in long after the right means had ceased to exist. Were the latter course marked by the public as immoral, which is its real character, we might hope to see it less frequently followed.

Perhaps there is need for some reform of our whole ideas regarding credit. When it is said that without credit business could not be carried on, that credit is the soul of business, and so forth, a truth is stated; but it does not properly imply anything more than this, that a man must be believed to have the means, as well as the honest intention, of discharging his obligations, in order that his transactions may go on smoothly, seeing that it is practically impossible, in any but a small class of cases, to hand the money in exchange for goods. It is to be feared that with the mercantile class generally, the maxim has come to sanction the incurring of obligations without any very rigid regard to the means of discharging them. Some appear to worship it as a principle which comes in place of, and dispenses with,

capital; but in as far as it is not expressly referable to actual means—that is, the means of making good, and that readily, any difference between the value of goods purchased or engaged for, and that to which they may fall, and all other unfavourable contingencies which may be expected to take place in the course of business—it is a delusion and a snare. Men proclaim that the business of the world would be at a stand-still if there were not this faith, not in things unseen, but in things which do not exist. We deny the assertion. The business of the world would be executed by men possessing real means, if it were not anticipated by men without means. The traders on *fiction*, who are a species of impostors, only so far prevent those who would trade on *fact* from having their legitimate share of the said business; and how far it would be better for the public at large that the latter class were not thus interfered with, it is superfluous to say.

There are no doubt wonderful doings amongst those who work upon fiction: happy strokes, dashing successful adventures, where there was no substance to stand good in the case of an opposite result, are well known. But these are only dangerous exceptions from the rule. The chances are, in reality, much against the success of a business conducted too much on credit. It is a system which always involves a higher scale of prices, and which is costly in its own procedure; thus reducing or extinguishing profits. There is even a more fatal evil attending it, in the demand which it makes on the time and energies of the trader, merely to supply ways and means. The few, as comparatively they may be called, who take the opposite plan, thrive as much by the freedom in which their minds are left to attend to the real affairs of business, as by any advantage they have in getting all things at the greatest advantage. It is merely the mistake of excessive acquisitiveness, or of rashness in combination with ignorance, that business cannot be limited to actual means. There is nothing to prevent it, if men will only be contented to do that in ten years which requires ten years, and not to attempt doing it in five, or three, or any shorter time. Let them use the gains of one year for the business of the next, and never try to make any sum of money do more than its proper amount of work. If they are to make a risk, let it strictly be one which, in its worst issue, will not embarrass them. On such principles, they will conduct their affairs with peace of mind, and with the best likelihood of success. Are such persons above credit—or is credit slighted by their course of procedure? Not at all. These persons enjoy true credit, in there being such an assurance of their substantiality, that whatever they wish to purchase, will be sent on their order—the whole play of the blood and muscle of their business will be healthy by reason of the dependence placed on them. Such is, in truth, the only right kind of credit. That which enables one man to do without money what another man does with it, is, as has been already said, a delusion.

The philosophy of these remarks entirely applies to the question regarding a circulating medium. Barter is, after all, the fundamental idea of commerce. When we pay for articles in gold, we are only exchanging one article for another. It is more convenient and economical to have notes representing the gold; but this does not necessarily imply that we may have notes which there is no gold to represent. That were to proceed upon fiction instead of fact. The gold lying in the coffers of the note-issuing company is not idle. It is serving all the time as a basis for the ideal character of the notes out of doors. But may there not be notes representing land, or houses, or goods, as well as gold? It has been tried and found wanting.* The basis article

* In America particularly. The Scottish banks are remarkable for the large business they long carried on upon the basis of general property; but for this there are special reasons in the smallness of the country, which makes every man's circumstances

must be readily available and receivable, otherwise the ideal money loses character, and its function ceases. Whatever tends to prevent a currency of this kind, or of any kind but that which is immediately backed by substances which mankind set a distinct value upon, and are always willing to receive at a certain rate, must be serviceable to the true interests of the community. There may be some evils attending it, not springing from itself, but from the imprudence which it checks; but the general force of this principle is clearly advantageous.

The evils of debt and bankruptcy may be said, like many others, to arise from the blind efforts of human ignorance and passion to fly in the face of natural ordinations which we cannot resist with impunity. If men would observe and go along with these ordinations, they would so far secure their happiness. But it so happens that a man may receive what is called a perfect or first-rate education, and yet be unacquainted with some of the very primary rules affecting his wellbeing as an inhabitant of the earth. The period of comparative security from this class of evils must, therefore, be expected only when the knowledge of mankind has been increased.

A LEGEND OF THE PARLIAMENT SQUARE.

REPORTED BY FRANCES BROWN.

I was the youngest of five sons, all of whom were apprenticed in different mercantile establishments in Edinburgh before I had left school; and my parents deliberated so long regarding the description of business suitable to my peculiar genius, that at length, in my eighteenth year, the advice of our schoolmaster, and my own selection, determined the matter, and I was bound apprentice to a respectable bookseller, who carried on his business in the lower flat of one of the old houses in the Parliament Square.

My master was a man of about thirty-five. In person he was thin, wiry, and rather low of stature; with an ascetical cunning countenance, oatmeal-coloured hair, and a remarkably even temper, allied to a large stock of accumulated caution, and a quiet store of dull pride, on the double account of what he called 'the old respectability of his family,' and a well-established business.

His premises consisted of a large shop and a small back parlour: the former had more than an average supply of customers, and the latter was filled every forenoon by the local literati and politicians, who dropped in one after another to discuss the news. When I became his apprentice, the duties of the shop were divided between two young men and myself. Being some years older than I, and brothers, they consoled so much together, that I found myself utterly alone, so that I was forced to relieve the tedium of a new and not over-active business by most diligently observing my master's movements, as the best amusement within my reach.

The house of which he occupied part was one of those huge fabrics, rising to the height of fourteen storeys, which might have been seen in the Parliament Square before the great fire of 1824. The shop and back parlour were situated on what was the ground flat towards the square, close beside the establishments of a tailor and a green-grocer. Adjacent to my master's door opened the common stair, which wound, flight after flight, up to the very attics; dingy, not over clean, and presenting the only medium of communication with the nether earth to some threescore persons of various ranks and fortunes, from Miss McMillan, the maiden lady, who occupied her family's town-house on the seventh storey, up to the two expatriated French mus, who made artificial flowers, at the gable windows

of the fourteenth. His home was in St John's Street, that ancient improvement of the Canongate, where his mother and two sisters, still called young ladies in right of their single state, occupied a self-contained house in a style of old gentility. Thence the bookseller came every morning at eight, as certainly as the hour sounded from the old clock of St Giles. Thither he returned to lunch at twelve, and to dinner at five, with the same unvarying precision. Each evening at eight he stole up the adjacent stair, after special precautions to avoid observation, returning regularly at ten to see the shop shut. The nature of his evening resort was for some time a mystery. It was conducted with such perfect secrecy, that I verily believe neither of the young shopmen ever suspected it. Being themselves, indeed, rivals for the smiles of the green-grocer's red-haired daughter, they were the less likely to trouble themselves about the matter. I, however, having as yet no folly of my own on hands, felt differently; and growing desperate on the twenty-first night of my unrewarded surveillance, I determined to follow him, though at a most respectful distance, up the dark stair.

On he went from flight to flight, passing with particular celerity the door of Miss McMillan, with whom he was on speaking terms on account of family respectability; but at length, on the ninth flat, he paused at a side door on the landing, listened for a few minutes, and then, as if convinced that all was safe, gave a low tinkle at the old brass pin which served as a knocker. The door opened, and the light streamed out. I heard a woman's voice, that seemed to speak in tones of welcome; but all I could catch of my master's response, for it was low and hurried, was, 'Miss Barbara.' The door was closed, and I crept to the keyhole. Oh ye that have secret courtships, beware of idle apprentices!

Within, there was a large apartment lighted by a clear coal fire, and a couple of small candles placed on a table covered with all manner of millinery apparatus; morsels of all colours were scattered about; there were two chairs, each supporting a silk dress, apparently fresh from the needle; two more, occupied by as many ladies; and one had been just placed for my master; besides which, a small shelf of books, and an article which might have been either a folding-bed or cupboard of the olden time, were the only pieces of furniture visible to me.

The inhabitants were evidently poor; but the dress of one of them, nearest whom my master sat, though cheap and well worn in more senses than one, attracted even my boyish eye from the superior taste and neatness of its arrangements. She was young, but not a girl; her face was mild, and remarkably intelligent. She was pale and slender; life seemed to have gone hardly with her; but her eye looked bright, as if for the present all things went well, as it glanced from the bookseller's face to the white lace and bright pink ribbons of which she was framing a cap. The other was a large gray-haired, hard-looking woman, robust in her age as a tree that had only time to strive with, and knew no inward waster. The black in which she was clothed from head to foot seemed old and strong as herself, and there was a usurer-like hope in the glance with which she surveyed my master, like one who anticipated a good bargain. But what an altered man was he from the quiet cautious bookseller of the shop and the back parlour! Never did the climbing of nine storeys, even in the Porcelain Tower, effect such a transformation! His words flowed fast and free, as a winter millstream; his air had attained the very sublimity of self-conceit; and no sultan could have taken possession of his divan with an air of more undoubted authority.

His conversation was entirely addressed to the younger lady, whom I soon discovered to be Miss Barbara Johnstone. But oh what a world of petty falsehoods regarding his own exploits in and out of the shop! What professions of candour, liberality, and disinterested affection, combined with every human virtue,

readily known, and in the extreme prudence with which the business of banking was always conducted in this part of the empire. These things, with time, produced confidence, and enabled bankers to do with less gold than is usually necessary.

did my worthy master declare to that delighted listener! And how often did her fair beaming face rise from that tedious piece of millinery with applause, and laughter, and admiration, for all his wit and wisdom!

Seriously, I have always been a lover of justice; and it might be that that love was stronger in my boyhood, which may account for certain longings for water and a syringe which came across me at the moment, especially considering the convenience of the keyhole. But those useful articles were far below; besides, the silk dresses, and that mild face, were in the way, and a rising movement on the part of the bookseller was enough to send me with all possible expedition back to the shop.

No one had missed me; but scarcely had I taken my accustomed place, when in stepped a young man, tall, dark, and rather handsome, but evidently fresh from the country, and wearing the weary look of one exhausted by a fruitless search, yet determined to make a last effort as he leant his arms on the counter, looked bashfully round the shop, and at length, fixing on mine as the least appalling face, inquired if I 'knew the present abode o' Mistress M'Clatchie, sometime house-keeper to the Laird o' Loch Drumlie, and her nieces, Miss Barbara Johnstone?' which, he understood, was situated somewhere in the Parliament Square.

The bookseller's company rose to my remembrance, and here was an opportunity, such as no prying apprentice could neglect, of learning something of their history; so I answered the stranger's question by demanding, 'What sort of a woman was Mrs M'Clatchie?'

'Good-looking, but a wee camstarie, an' aye dressed in black like a gentlewoman,' responded he.

'What business did she follow?' I continued.

'Oh, naething ava,' said the applicant. 'She had siller o' her ain; but her nieces was a mantymaker. Do you ken onything o' her?' he added with increasing earnestness.

Had I been farther advanced in years, it is probable that our proverbial northern prudence would have suggested some further delay and investigation; but as it was, the stranger's anxiety overcame my youth, and I at once directed him to the ninth flat, first door on the right-hand side. He stammered out his thanks, and bolted up the common stair, leaving the shopmen tittering at his uncouth appearance; but in less than half an hour my master returned as quietly, though much earlier, than usual, and we all observed that something disturbed the equanimity of his temper that evening.

Next day the stranger called again, when the back parlour was free. The bookseller saluted him as an acquaintance; and great was my amusement when, entering with a message devised for the occasion, I witnessed his awkward bows and bashful acknowledgments while my master introduced him to the luminaries there as Master Dugald M'Dougal, son of the Reverend Duncan M'Dougal, now minister of Stracathich, in the North Highlands, whose sermons on Predestination had created such general interest in Edinburgh about twenty years before.

As his embarrassment wore away, it was wonderful what intelligence the mighty men of the back parlour found in him; and on his departure, all broke forth in the stranger's praise, my master leading the way in his usual quiet and lengthy fashion.

M'Dougal had been brought up in the primitive piety and simplicity of a Highland clergyman's household—among hills, and glens, and shepherds; but a love of poetry—so often found in what one of its votaries has called 'the earth's wild places'—took possession of his mind. The numbers came, whether regularly or not, I cannot tell; but he sung, and became great among his people. His verses were translated into Gaelic by the patriarchs of the heath; the pipers of Stracathich found airs for them; the lasses sang them at their spinning wheels; and he had sought the northern capital—with letters of recommendation from scores of Highland lairds and ministers, who considered him the

glory of his native glen—in order to publish a volume of poems, which, as they were admired by the Macraes and Mackays, he believed must secure the applause of all Britain, and command certain pecuniary supplies necessary for the accomplishment of the cherished hope of his life—the pursuance of his father's profession. Nor was this design unmingled with memories of Mrs M'Clatchie and her niece, who, being cousins in only the fourth degree, had been intimate with the poet's family while they managed the house and dairy of Loch Drumlie till the decease of the old laird; and certain rumours of his successor's intention to bring home a lady, had made the gentle aunt remember that Barbara possessed elegant hands, and might repay with tolerable interest all she was discovered to have cost that calculating dame since the death of her parents—which event took place in Barbara's infancy—by a small additional expenditure on her apprenticeship to a dress-maker: it was for this reason that they had removed to Edinburgh. There Barbara acquired, in one year's attendance on the establishment of the Misses Menzies (for her aunt would allow no more time), sufficient dexterity to carry on a small private business of her own in the domicile where I had seen her; the profits of which were barely sufficient to support herself and the amiable lady, who insisted, in her own peculiar parlance, 'on being kept as lang as she had keptit her; and that,' she was wont to add, 'was a gey while!' whilst the earnings of her own housekeeping-days accumulated interest in the savings' bank.

Thus they lived till Barbara reached her twenty-fifth year, her aunt always insisting that she was only nineteen; the girl expending her energy and ingenuity on every form of figure and temper, on all manner of materials, from serge to satin; and Mrs M'Clatchie superintending the expenditure of the supplies, and daily exhorting her niece to 'thank Providence, wha had graciously gien her a guide and a director.'

Poor Barbara could have dispensed with her direction at times; but she had grown used to the old flint, and without her the workroom would have been solitary, unless, indeed, for the visits of my worthy master, who had dropped in for the last seven months as duly as the evening fell, and wherefore, none could say with certainty, for he had never committed himself by either vow or declaration; but having seen Barbara frequently pass up the common stair, an acquaintance slowly grew up between them, which at length ripened into intimacy; but the bookseller kept his visits a solemn secret, for he knew how to contrast the respectability of his family with the rank of a dressmaker.

All this I learned in progress of time by those two gates of knowledge—as an Eastern philosopher hath it—inquiry and observation; and partly from the poet himself, who regarded me with some degree of confidence on account of my first service.

He had taken lodgings in the square; and as I found time to keep watch over his movements, as well as those of my master, it was soon manifest that the winding stair was trodden with equal frequency by both. But while M'Dougal went with the frankness of a friend at all hours, the respectable bookseller continued to prefer twilight for his visits, and always returned sooner if he found the young Highlander before him—a fact of some importance to me in those apprentice times, as I learned by the poet's motions to estimate the probable duration of my master's absence.

Let me also confess, though it is now with some confusion of face, that often, as the winter evenings lengthened, was I the unobserved rearguard of both aspirants. Through the same quiet keyhole I saw and heard the bookseller exhibit his wit, his wisdom, and, as far as words could do, his wealth; and young M'Dougal grow eloquent over the story of Burns and Highland Mary, and the beauties of the kirk and manse of Stracathich; but I also perceived that credible medium, the warm flush which brightened the fair face of Barbara when she welcomed my master, compared with the calm and

friendly smile with which the poet of the Highland glen was greeted. Yet there was peace between the rivals. M'Dougal continued to frequent the shop, and was invited to the back parlour. The bookseller praised him. His acquaintances and friends increased. It was the period of patronage in our city; for the lesser lights had the example of Scott before their eyes, and the Highlander became, in the language of one of our shop Jeffreys, 'the Hogg of the Parliament Square.'

M'Dougal was treated with toddy, and invited to suppers by all the admirers of literature in that vicinity. There he sang his own songs, which were printed clandestinely by obliging 'devils,' and circulated at small tea-parties by poetical shopmen. The more exalted luminaries at length became aware of their existence, and a subscription was proposed in order to bring out his volume.

My master's friendship kept pace with the poet's popularity. It was of that cautious order that never outsteps its neighbours. Besides, he believed that M'Dougal had little chance with Barbara; and the young Highlander himself seemed to be of the same opinion, for his journeys up the common stair had grown less frequent, greatly to the relief of Mrs M'Clatchie, who styled him, in his absence, 'A plackless ne'er-dowel,' and talked of nothing in his presence but the iniquity of 'toom pockets.'

The city was working no promising change on him. He had learned late irregular hours, never known in Strathclathick, and was often heard chanting the praises of Highland hills and lasses down the High Street, under the inspiration of waters stronger than those of Helicon, at the wrong side of two in the morning.

Thus matters went on, and so did the subscription list. Tighter and tighter still the bookseller drew the bonds of intimacy. I, as well as my shopmates, occupied the most of my leisure hours in wondering where this would end; but when the subscriptions had attained to three hundred, the mystery was solved: my master was to be the publisher.

Publishing had been the dream of his bookselling ambition; it was the only glory wanted to make his name and business overtop those of his early and long-standing rivals in the High Street; and now that the subscription made it safe, he became M'Dougal's publisher. Never shall I forget the solemnity with which the fact was announced in the shop, or the quiet importance of my master as he talked of octavos and duodecimos with old Watson the printer. It was a great day for the shopmen when the poet arrived with his manuscript, the arrangement of which occupied him and the choicest spirits of the back parlour for at least a fortnight, their toils being nightly concluded with a supply of oysters and toddy, paid for according to lot, after which the company separated with a general burst of song, prolonged by M'Dougal to the entrance of his own lodgings.

The proof-sheets were corrected under similar circumstances; but at last the labours of the press were finished, and the volume appeared on my master's counter—a thin octavo, bound in marble paper with leather corners in the newest fashion of the period. Some surviving copy may yet be found among the book-stalls of Leith Walk or George IV. Bridge, the last refuge of forgotten poets. It may seem poor and unpromising now; but not so in its first days. Then my master grew great over it, for his name was on the title-page; M'Dougal was glorious, for his songs were in a book; old Watson was satisfied, for he had printed it; and we were all delighted, for the event was new.

That night a supper was given to the poet by his friends in John Dowie's tavern, at which the publisher, the printer, and even the apprentice were present. But let me not enlarge on the glories of the evening, for their light is seen through shadows. How my master proposed the poet's health at the sixth tumbler, with a speech which began with the triumphs of genius, and ended with the respectability of his own family; how

M'Dougal returned thanks, and finished his oration with a Highland howl over the cruelty of Barbara Johnstone; and how old Watson fell under the table, vociferating for some one to drink prosperity to the printer, are matters on which I will not dwell; suffice it, that if not the whitest, the night remains among the merriest in my recollection.

Divine wisdom has averred that 'in the multitude of counsellors there is safety.' I suspect the passage does not apply to books; at least in the case of poor M'Dougal, it soon became evident that a more vulgar proverb, regarding two stools, was applicable. All sorts of advices were given and taken in the publication of the volume; twice the number subscribed for were printed, from the assurances of sundry friends that they must be sold. But as things proceeded, it was discovered that neither the trade nor the public agreed in their pecuniary valuation of the work. Scores of subscriptions remained unpaid, and dozens of the most zealous subscribers could nowhere be found. Promises made how fervently over toddy, took to themselves wings and fled away from the promisers' minds; and the poet, who was by this time puffed into a conceit which made him a considerable trial to the patience of others, became first impatient, and then furious, at these repeated disappointments. He ascended one evening to tell his wrongs, and seek consolation in Barbara's workroom; but some observations of his gentle cousin regarding his irregular habits, enlarged upon in rather ungentle terms by Mrs M'Clatchie, drove him swearing down to the square again, and from thence to John Dowie's tavern; after which he visited the ninth storey no more.

In the meantime, the volume went off in various ways; and every new burst of wrath at its injuries from the hands of false friends or foul critics, was finished with what M'Dougal had learned to call 'a glorious (but, in reality, a drunken) evening.' Debts were contracted, and creditors referred to the period of winding up accounts, at which the half-wild and undisciplined Highlander still expected the long-promised supply. That day came at last. Much had been left to the discretion of Mr Morrison. That worthy gentleman was new in the publishing department, but old in the matter of attending to his own interest. What was his particular mode of managing the affair, I never clearly understood; nor, I believe, any one else, as he kept the details in profound secrecy; but there was a meeting in the back parlour, at which the door was kept fast shut. Through it we could hear voices in long-continued altercation, which gradually rose higher and higher. At last the door flew open, and out came the poet, dragging old Watson along by the collar, and literally kicking my master before him.

Of course we all rushed to the rescue, and Morrison roared for the City Guard, three of whom, in a few minutes, made their appearance. After a desperate struggle, the poet was captured, and borne off under a charge of assault, to be dealt with by the bailie. But, in passing Blackfriars' Wynd, he burst his bonds, overthrew the guardians of the peace, and darting down that memorable close, escaped the jurisdiction of the law, as we afterwards heard, by making his way to Leith, and embarking as a common seaman on board the Royal Charlotte, a vessel engaged in the whale fishery, which sailed the following week for the coast of Greenland.

Of the history of that meeting there remained no record for us, but a perfect mass of written papers, so torn, that they were utterly illegible, which the bookseller declared to be his accounts—a rather long-winded and unintelligible story, which he and Watson were in the habit of telling contrariwise—two black eyes with which my worthy master was invested—and the sincere congratulations of Mrs M'Clatchie to the whole 'land' (which is an Edinburgh term for one of its accumulations of houses) on the departure of the 'graceless, plackless, randy creature,'

It was early in the spring when poor Dugald left

us; and scarcely had his vessel cleared the Firth of Forth, when one of those continuous storms which sometimes visit our coasts at that season came on. For a whole week it blew a hurricane from the north-east, to the demolition of infinite chimney-pots and tiles. When the weather cleared, a gray-haired but strong and venerable-looking man walked into the shop one morning, whom Mr Morrison recognised, with considerable embarrassment, as the Rev. Duncan M'Dougal.

He had come to Edinburgh to inquire after his son, strange rumours of whose conduct had been the only answers to his late letters of warning and advice. He was taken into the parlour; old Watson and two or three friends were sent for; but in the midst of their explanations, the Edinburgh Courant was brought in, containing, among other tidings of disasters at sea, the intelligence that the Royal Charlotte had foundered in the recent tempest off the Shetland Isles, and every soul on board perished.

I heard something fall heavily as the news was announced, and rushed into the room just in time to assist in raising the old clergyman from the floor. But he never uttered a word except 'The Lord's will be done!' and left the shop in about half an hour, leaning heavily on his staff.

I have heard that neither he nor his family ever left their Highland glen after that event, and the old pastor was specially remarked for his earnest watchfulness over the young of the flock.

On his next visit to the ninth storey, the bookseller found Mrs M'Clatchie engaged in stitching threepence worth of crape on her ancient bonnet, and her first salutation was, that she 'hoped the lad had gotten fair play,' since she 'was put to a' that expense for the credit o' the family.'

Poor Barbara's eyes filled with tears as she hoped he had been kind to Dugald. Mr Morrison, finding the workroom somewhat uncomfortable, made his visit short, and from that time exhibited symptoms of drawing off. Barbara took no measures to draw him on; she had thought of the man more than the bookseller; but Mr Morrison knew that the same kindly welcome awaited him whenever he pleased to return, and valued his own time and attentions accordingly.

I know not how it was, but from the publication of that unlucky volume, my master's business prospered; customers increased, friends multiplied, his concern was enlarged, and, having entered the publishing department, he became gradually known in it, and brought out sundry safe works of medicine and theology, under college patronage, and with secure profits, before my apprenticeship expired.

Barbara continued to stitch in the ninth storey with the same patient though unprospering industry; but close application to her sedentary business, dreams of the far Highland hills, or visions of the shop below, began to tell upon both health and spirits, for she grew paler, and ascended the long stair with a more weary step than formerly. My master's prudence kept pace with his prosperity; his conviction of his family's respectability deepened every year; he was now remembered among the arrangements for evening parties—had gone to the 'assembly,' and been rallied regarding the daughter of a wealthy merchant in Leith; but still he stole up stairs at times, though now with greater secrecy than before, as if whatever served him in lieu of a heart lingered still about the poor dressmaker, in spite of her gracious aunt's occasional hints, that 'he was nae better than a fause-hearted loon!'

Four years had elapsed since the wreck of the Royal Charlotte, and Dugald and his volume were forgotten in Edinburgh, except by Mr Morrison, who retained him as a warning for all the tuneless brethren—by the way, an abundant commodity in the Modern Athens—to none of whose proposals could he be induced to listen, always declaring, with a rueful shake of the head, that M'Dougal's poems had almost ruined him. There were changes among us. Of the two shopmen, one had be-

come a travelling agent, and the other a clerk to the establishment. I was exalted to their former station, and another apprentice had taken my place; but change in my master there was none. He was the same smooth-spoken, carefully-dressed, and cautious individual, only somewhat more important, and given to converse only with men of capital.

It was the night of the 1st of March 1807. The circumstance I am about to relate has engraven the night on my memory. The almanac reckoned it spring; but winter was with us still in all its severity. The snow lay deep on the streets, and the night set in with intense frost and brilliant moonlight, which charmed out the citizens, young and old, as if to begin another day. But hour after hour passed: the crowds had melted away: the latest shops in the High Street were closed, and only the door of our own remained open.

The apprentice had put on the shutters, the clerk had settled the ledger, and I had cleared the *till* under the eye of Mr Morrison, who, having increased in prosing as well as property, now stood delivering, for our general edification, a minute statement of the mode of keeping accounts adopted by his uncle in London, who was a considerable merchant, and the glory of the Morrison name. From our hearts we wished the worthy Londoner at the bottom of the Thames, for all were tired of his greatness and the piercing air. Our backs were to the open door. I solemnly declare I heard no coming step, when, from behind the bookseller, a loud voice demanded, 'Ha'e ye got an account for me?' and turning, we saw a man in a sailor's garb, dripping wet, and sprinkled with snow, with his hat drawn down, as if by way of protection from the frosty air.

'For you, sir?' said my master in his usual cautious manner. 'Ahem, what's the name?'

'Dugald M'Dougal!' shouted the stranger, raising the hat, and turning full upon him. 'Are all the copies sold yet?'

We all knew the voice and figure, and with one accord rushed out of the shop, and through the square. I will confess that the young apprentice stumbling over me was the first thing that recalled my presence of mind; and finding the clerk close to my side in the clear moonlight, and three of the guard coming up at the moment, we at once walked back in a body to see what had become of our employer.

The shop was as we had left it, but the stranger was gone, and the bookseller lay stretched behind his own counter, pale and cold as a corpse. We raised him, and medical assistance was speedily procured; but it was long before the man came to himself, and when he did, no one could draw from him the smallest explanation or account of what had happened in our absence. Indeed he seemed resolutely determined on silence. Whatever it was, that night wrought a strange alteration in him. Ever after, he was grave and thoughtful, but so anxious to get out of business, that he disposed of his whole stock in trade to a relative within a fortnight from the occurrence.

The following morning he was seen descending from the ninth storey, and in Scottish parlance, 'he and Barbara Johnstone were cried in the kirk next Sabbath,' much to the amazement of the neighbourhood, and especially that of Mrs M'Clatchie, who, it was confidently said, received a certain amount of money to waive all further claim on her niece's exertions, and return in peace to Stra'clathick; at all events, thither the old lady went, and I heard no more of her.

Mr Morrison's after-proceedings were still more extraordinary. He purchased for himself a handsome house and grounds in one of the neighbouring villages, and having established Barbara there in matronly state, commenced a course of studies for the church, which he completed with credit, and became the laborious and rigidly-pious pastor of a country parish.

It was said he made an excellent husband; and Barbara looked happier in that handsome country-house

than ever she had seemed in the ninth storey, under the administration of Mrs McClatchie. But nothing ever transpired to clear up the mystery of that singular visit. Only about the time, there was a Swedish vessel in the harbour of Leith, with one very drunken seaman on board, supposed to be a native of Scotland. Whether it were possible for poor Dugald to have appeared in the Parliament Square, wearing the garments of the living, or not, could never be determined, as neither his family nor any of his former friends received the least token of his existence; but often when passing the neighbourhood, the scene of that strange night occurs to my recollection, along with the ghastly face of my terror-struck master.

THE MARSH-GARDENER OF THE PARISIAN SUBURBS.

The term 'marsh' naturally suggests to the mind the image of a greenish lake, shallow, miry, and ill-odorous, enamelled with water-lilies and waving rushes, and swarming with frogs in summer, and with snipes in winter. This, however, is not a description of the locality called the Marsh in the environs of Paris; it was doubtless, at a former period, the receptacle of seasonal inundations, which, having no outlet, gave it the character from whence it derived its present name; it has long, however, been drained and cultivated, and transformed into a vegetable garden.

Destined solely for the culture of edible plants and roots, these marshes or market-gardens surround the capital on every side, both within and without the enclosure of the walls. By whatever barrier you leave the city—whether you follow the dusty route of the *châssée* of Vincennes, or the imposing avenue of Neuilly—whether you visit the funeral shades of Pere-la-Chaise, or the sandy plain of Grenelle—the scene that everywhere meets the eye is a series of interminable parallelograms, planted with salads, spinage, carrots, cabbages, horse-radish, and haricot-beans. Not an inch of land is wasted in these enclosures. The pathways running between the squares are scarcely wide enough to afford a passage to a single pedestrian: the glazed *maisons* which cover the melons sparkle in the sun like plates of silver. The neatness which reigns in these plots of ground, the vigour of the vegetation, the exquisite condition of every little bed and border—all announces that the art of cultivation is there carried to the highest point of development.

In a corner of the enclosure rises some few feet above the soil a cabin covered with thatch. Judging by the taste which presided at the erection of such a habitation, by its ruinous condition, but ill-concealed by the undulating branches of the vine, and by its miserable aspect, one would imagine it not the dwelling of a French citizen, at the gates of the French capital, but the squalid lair of a savage, reared a hundred leagues from all examples of civilised life. The interior is void of flooring and papering, and nearly so of furniture. From a hook over the chimney-piece hangs horizontally a flint-gun with ponderous butt and rusty barrel; here and there a few queer images hide, but do not adorn, the dilapidated walls; near this vile domicile stands a shapeless shed, which serves as a stable, a cart-house, and a magazine; and near the dwelling is the smallest of possible pleasure-gardens, evidently spared with regret from more profitable cultivation, where, at the foot of an apricot-tree, the violet, the rose, the clematis, and the sweet-basil diffuse their welcome odours.

Let us now glance at the inmate of this undesirable dwelling-place. The animals which are considered the symbols of labour and industry—the beaver which builds his cabin; the ant which digs his sinuous granary beneath the sward, the bee which labours profitably from dawn to sunset, the woodpecker whose patient beak perforates the bark of the oak—are inactive beings, indolent, torpid, compared to the marsh-gardener.

It is hardly two o'clock in the morning when he leaves his bed. The roots, plucked and tied in bundles the evening before, are methodically arranged in the well-worn vehicle. The cultivator makes the best of his way to market, and, transformed into a merchant till seven o'clock in the morning, divides his commodities among the fruiterers, market-women, and hotel-keepers of the capital. He frequently, it is true, disposes of his produce of a certain kind, in the mass, but he is still compelled to go to market himself with the greatest portion of his crop. Returning home, he throws himself upon his bed, which he is soon compelled to quit, in order to dig, to hoe, to rake, to plant, to pluck, to weed, and, above all, to *water* his precarious charge.

The method of watering adopted by the marsh-gardener is of ingenious simplicity. The well is situated in the centre of the grounds, and surmounted by an axle-tree or cylinder, round which the rope is entwined; a couple of old cart-wheels, placed horizontally at about four feet distance from each other, and united by laths, ordinarily compose the cylinder. A living skeleton of a horse causes the vessels attached to the rope to ascend or descend alternately, according as his movements are directed to the right or the left. To obtain from the poor animal this mechanical docility, they cover his eyes with a cowl—blind him, in short—that he may not go astray, but perform with more certainty his monotonous revolution. Alas! it is easy to see, by his meagre flanks and melancholy aspect, that the starved steed is already oppressed with the presentiment that his present position is but the antechamber to Mont-faucon and the knacker's yard!

The master is there, barefooted, for the perpetual moisture would speedily render useless every species of foot-covering. He pours the contents of the buckets into a cask, which at first sight seems, like the sieves of the Danaïdes, to empty itself as fast as it is filled; the cause of this being an extensive communication by subterranean tunnels with a number of other casks, half-buried in the ground, at various convenient spots in the garden, so that the *maratcher*, whatever portion of the ground he may wish to irrigate, finds the means of doing so always at hand.

The dexterity with which the marsh-gardener manages his two watering-pots surpasses that of the conjuror with his loaded staff, or of the juggler who hurls aloft his gleaming weapons. Grasping the vessel by the spout, he plunges it into a cask; and seizing it as it rises by the handle, with astonishing celerity distributes to each plant its liquid ration, without wasting a single drop.

The *maracher*, as he is called in French, sows and reaps all the year round. In winter he digs up the soil, spreads the manure, prepares the beds for the spring produce, and if the temperature is mild, waters them. He is as great a utilitarian as the members of the Commune of Paris, who, in the days of the Revolution, caused the ornamental squares in the gardens of the Tuileries to be planted with potatoes. He hardly consents to tolerate a flower at the extremity of his enclosures. He draws from the land all that it is susceptible of producing. He makes three seasons—that is to say, three harvests—in the course of a year; but this is only accomplished at such an outlay for manure, as reduces his profits to the minimum. Upon two acres of land, upon which are established ten or a dozen sets of glazed frames, and about fifteen hundred plant-beds, each small enough to allow of being watered by hand, the manure and litter of thirty horses is required; and one of the laborious occupations of the marsh-gardener consists in going from one mansion to another collecting the indispensable material, which ennobled proprietors do not disdain to sell him at the highest possible price.

The *maracher*, however, does not cultivate indiscriminately all edible vegetables. Potatoes and green pease he will have nothing to do with, as being articles

too unprofitable. The melon is his favourite fruit, and receives most of his attention, and he knows well the means of imparting to it a flavour which it does not acquire even in more southern latitudes. He never rears more than two in one frame, that they may have plenty of space to grow. He waters them abundantly, but with discretion, and protects them against the rigour of the seasons with paternal solicitude. Alas! this is no case of *similis simili gaudet*; for while the melons swell to an enormous size, he continues lean and worn with watching, anxiety, and beggarly diet.

The toil of his long days and wakeful nights procures him but a scanty remuneration. In vain he practises economy to the verge of avarice; in vain he sells his miserable horse at the approach of winter, to buy another in the spring; in vain he lives upon vegetable food, to avoid the expense of butcher-meat; it rarely happens that he can amass sufficient to provide for the necessities of old age, but continues in harness, so to speak, to the last, watering and weeding to the day of his death; and dies at length, pitcher in hand, and, like the Emperor Vespasian, on his legs. Perhaps he had dreamed of a retreat from toil; perhaps he had often yearned after a shelter, like that so ardently desired by Rousseau—a white cottage with green shutters; but it is seldom more than a dream. Outworn and broken down with fatigue, the marsh-gardener, for the most part, dies on the field of his labours, and rests but in the grave.

One great cause that contributes to the poverty of the maraicher, is the plunder to which he is subjected by bands of marauders made up of the scamps and scoundrels of the vicinity. The mastiff kept on the grounds is redoubtable for nothing but his bark, since, if he were let loose after a thief, he would do more mischief than a battalion of foragers. Wo to the cultivator whose hotbeds are far from his dwelling, or near a public thoroughfare! He may lose in a night the fruits of months of labour, and neither his dog nor his firearms may protect him from the spoliation of these audacious bandits.

Moreover, in open day let him but turn his back for a moment, and he is the victim of thoughtless and culpable depredations, which go far to justify the mortal hatred he bears to all Parisians. Sunday is come: mechanics, costermongers, griettes, are let loose upon the country; the confinement imposed upon them by labour is interrupted for a day; they smooth their care-wrinkled fronts, assume their gayest attire, and hasten in all their adornment to the open fields, with joy in their hearts, and laughter and song upon their lips. It is a festive day for them; but not so for the cultivators of the environs, who look upon their arrival as that of so many devastators and pillagers; and not without reason. There is not a hedge which they do not escalate, not a patch of corn which they do not trample down, not a garden which they do not despoil. They destroy a hundred ears of corn in plucking a single poppy; they lop unmercifully the young trees of a nursery to make a walking-stick, which they throw away the next minute, or unceremoniously plunder a garden, to add to their pic-nic a lettuce or a plump melon.

His resentment towards the inhabitants of the city is probably the cause of the marsh-gardener's backwardness in civilisation. Be that as it may, it is certain that, although brought up near the source of science, he has never imbibed a single drop of the stream. His ignorance is as complete as that of the butcher of Morvan, or the herdsman of the Cevennes. He commences labour at too tender an age to have leisure to learn the art of speaking and writing correctly. With strong and deep-rooted prejudices, he is a foe to all innovation, especially in matters of culture. Unlike the rest of the world, he has escaped the reformatory influence of the Revolution, and still preserves his ancient costume pure from all the inroads of fashion,

even to the gigantic ear-rings peculiar to his class during the past century.

The commune or corporation of which the maraichers formed part in times long past was that of the horticulturists. The first regulations dated from 1473; new statutes were published, by the sound of the trumpet, in 1545, confirmed by Henri III., Henri IV., Louis XIV., and registered by the parliament in 1645. This corporation had the sole right of selling melons, cucumbers, artichokes, herbs, fruits, saplings, &c. It elected four judges, who, twice a year, visited the marshes, gardens, and all land under similar cultivation, to prevent the employment of noxious matter as manure. The apprentices served four years under the master, and two years as companions. Those who aspired to mastership, unless they were the sons of masters, were never received but upon the production of some proof of merit in the shape of fruit of superior flavour or unusual dimensions.

Notwithstanding the abolition of their privileges, the maraichers still preserve their *esprit de corps*, and solemnise their annual holiday together with the members of their ancient body. They persist in keeping at a distance all the other industrial classes; and the daughter of one is never given in marriage but to a man of the same profession; in truth, her talents—her sole dowry—would be of little advantage to any other artisan, consisting, as they mainly do, in the arts of weeding, hoeing, raking, and planting cabbages.

The wife of the marsh-gardener, his sons and daughters, dig, sow, and cultivate the ground in company with him. The only alien auxiliaries that they admit are the soldiers of the garrison of Paris, whom they hire at three-halfpence an hour during the great heats of summer. On this subject we offer the reader a curious and authentic anecdote.

It was on the 14th Thermidor, in the year 5; or, to speak more Christianly, on Thursday the 1st of August 1797. Some detachments of the army of the Sambre and Meuse, sent for to Paris by the Executive Directory, came to manoeuvre in the enclosure of Saint Lazare. The general had alighted from his horse, and was walking with some officers, when at the end of the Faubourg Poissonnière he stopped at the gate of a marsh-garden. Without troubling himself at the presence of so dignified a personage, the cultivator, an old philosopher, continued drawing his water.

'Good-day, Father Cardin,' cried the general.

'What! you know me?' said the old fellow amazed, respectfully baring his white head.

'To be sure, old friend, ever since '87. I was then but nineteen. I served in the regiment of the French Guards, of which Marshal Biron was then colonel; and was quartered at the barrier Poissonnière. Have you forgotten me?'

'Faith I have then. Let me recollect: there were then at the barracks two companies of fusiliers, and one of grenadiers: to which did you belong?'

'To the grenadiers: you used to employ many of them occasionally to assist in watering your garden. Do you recollect, amongst others, the son of the kennel-warden at Versailles?'

'Stop a bit! Was he not recommended to me by his aunt, a fruit-seller at the same place?'

'Precisely.'

'Hadh't he the trick of buying books with the money I paid him, and paying another man to mount guard for him, that he might have time to study them?'

'Your memory is returning, Father Cardin.'

'He used to warble like a nightingale; I recollect he told me one day, that when a child, he used to sing in the choir at Saint-Germain-en-Laye. Ah, I remember him well now! What is become of him?'

'He is become general-in-chief of the army of the Sambre and Meuse; I am the self-same man, old comrade.'

'You! Upon my soul I shouldn't have known you,' said the old fellow naively. 'You have got a gash

there on the right side of your nose, which spoils your handsome face; then your mustaches have grown like a bed of spinach; and you have a crop of epaulettes to boot. Faith! I wish my son, who is a corporal in the twenty-fifth demi-brigade, may make his way as well as you.

'That shall be my business, Father Cardin. I will make inquiries concerning him, and if the reports are favourable, I will see that he does not want advancement. So soon as I return to Wetzlar I will have him sought out.' Then remounting his horse, the general departed.

Left alone, old Father Cardin stood long silently by the well-side, and founded a thousand castles in the air upon the protection promised by the general; but unfortunately, one month from that day, he received the unwelcome intelligence that apprised him of the death of his former workman—LAZARE HOCHÉ.

THE POETRY OF DIET.

POETRY, for the most part, deals with the higher and more refined feelings of our nature; but we must be allowed to assert that it can handle, and (in so far as the subject admits of it) with equal success, topics of ordinary and commonplace character. It can speak not only of the nobler thoughts and emotions which throng through the human soul, but also of greatly less elevated ideas and feelings. What, for instance, can be more commonplace, what more ordinary, what more nearly approaching the low and vulgar, than the gratification of our alimentiveness? Yet this commonplace subject poetry by no means shrinks from describing. We do not allude to a well-known class of comic productions, in which drinking in particular is glorified, but propose speaking of poetry of an elegant as well as serious order.

We go at once to the very highest kind of poetry, and opening the pages of 'Paradise Regained,' we find that even the muse of Milton can condescend to describe, with an almost epicurean minuteness and appearance of relish, a feast of extraordinary richness and profusion. It is true that the tables are lighted up by the coloured lamps of fancy, but the viands are solid and substantial, the wines odorous and sparkling:—

'A table richly spread, in regal mode,
With dishes piled, and meats of noblest sort
And savour; beasts of chase, or fowl of game,
In pastry built, or from the spit, or boiled,
Gris-amber-steamed; all fish, from sea or shore,
Freshet or purling brook, of shell or fin,
And exquisitest name, for which was drained
Pontus, and Lucrine Bay, and Afric coast
(Alas, how simple, to these cates compared,
Was that crude apple that diverted Eve!): *
And at a stately sideboard, by the wine,
That fragrant smell diffused, in order stood,
Tall stripling youths, rich clad, of fairer hue
Than Ganymede or Hylas; distant more,
Nymphs of Diana's train, and Naiades
With fruits and flowers from Amalthea's horn. * *
And all the while harmonious airs were heard,
Of chiming strings, or charming pipes; and winds
Of gentlest gale Arabian odours fanned
From their soft wings, and Flora's earliest smells,
Such was the splendour.'

This ample provision for temporal wants was, according to Milton, displayed by the Tempter to the pure eye of our Saviour when 'he was an-hungred'—fasting in the wilderness. It is undoubtedly intended as an exposure of the indulgences of appetite. Charles Lamb calls it 'the severest satire upon full tables and surfeits;' but this does not render it less applicable to our present purpose. Indeed this view of the passage rather tells in our favour, inasmuch as we may infer that the poet had known by experience, and could estimate at their true value, such sensual gratifications. But how fine is

the description of the profuse provision!—the varied incitements to appetite!—with all the refinements which taste could suggest, applied to decorate and cover with ornament the grosser elements of the display! Even the metrical construction of the passage is in accordance with its spirit. Observe how many *commas* are in it!—how much it is broken up into separate little clauses!—as if, when we read it, we were actually hanging, with longing admiration, over the well-furnished table it describes. We cannot read it quickly onward; it must be perused deliberately, mouthful by mouthful, tasting as we go.

The fine critic whom we have just mentioned, in one of his delightful essays, playfully objects to the richness and luxury of this feast and banquet, and contrastingly approves of the simple fancies which Milton supposes to have previously visited the Saviour in his dreams. As this passage, too, is akin to our purpose, we are induced to quote at once the remarks and the extract. 'I am afraid,' says Charles Lamb, 'the poet wants his usual decorum in this place. Was he thinking of the old Roman luxury, or of a gaudy day at Cambridge? This was a temptation fitter for a Heliogabalus. The whole banquet is too civic and culinary, and the accompaniments altogether a profanation of that deep, abstracted, holy scene. The mighty artillery of sauces which the cook-fiend conjures up, is out of proportion to the simple wants and plain hunger of the guest. He that disturbed him in his dreams, from his dreams might have been taught better.* To the temperate fantasies of the famished Son of God, what sort of feasts presented themselves? He dreamed, indeed,

— "As appetite is wont to dream,
Of meats and drinks—nature's refreshment sweet."

But what meats?—

"Him thought he by the brook of Cherith stood,
And saw the ravens with their horny beaks,
Food to Elijah bringing, even and morn,
Though ravenous, taught to abstain from what they brought:
He saw the prophet also, how he fled
Into the desert, and how there he slept
Under a juniper; then how, awaked,
He found his supper on the coals prepared,
And by the angel was bid rise and eat,
And eat the second time after repose,
The strength whereof sufficed him forty days:
Sometimes that with Elijah he partook,
Or as a guest with Daniel at his pulse."

Nothing in Milton is finer fancied than these temperate dreams of the Divine Hungerer.

Turn we now alike from these dream repasts, and from the gorgeously-appointed table of the tempting Enemy—which, whether we account it as having been purely imaginary, or real and substantial, created for the time-being by evil power, was dismissed as it appeared, untouched and unpartaken off—to one described as having been actually enjoyed, and so described also, by the same poet.

When Raphael (according to the Miltonic account in 'Paradise Lost') was sent down to Eden to warn our first parents of the danger which threatened them from the wiles of the great Enemy, Adam—seeing from a distance 'his glorious shape,' which

— 'Seemed another morn
Risen on mid-noon'—

desired his fair partner to prepare a fit repast for their expected angelic guest. They have first a short, pretty, and domestic-like discussion about what the materials of the said repast shall be; and then, while Adam advances to meet their heavenly visitant, Eve

* There is a little indistinctness here. The critic first seems to blame the poet, but in this last sentence he appears to blame the Tempter. In our opinion, Milton clearly intends that we should regard the feast as a grand mistake on the part of Satan, who imagined that the pure desires of Christ were to be tempted by such 'pompous delicacies,' and was therefore proportionately mortified when he despaired and condemned them. In this view, then, the passage, far from being in the slightest degree inappropriate, bears a far higher moral significance.

* What a fine chord of reflective morality is here incidentally struck! It keeps vibrating in our ear, in an undertone, through all the rest of the passage.

sets out to gather and arrange the various fruits which as yet formed the whole range of food for man :—

— ' With despatchful looks in haaste
She turns, on hospitable thoughts intent :
What choice to choose for delicacy best ;
What order, so contrived as not to mix
Tastes, not well joined, inelegant ; but bring
Taste after taste upheld with kindest change :
Bestir her then, and from each tender stalk,
Whatever Earth, all-bearing mother, yields
In India East or West, or middle shore
In Pontus or the Punic coast, or where
Alicious reigned ; fruit of all kinds, in coat
Rough, or smooth rind, or bearded husk, or shell,
She gathers, tribute large, and on the board
Heaps with unsparing hand. For drink the grape
She crushes, inoffensive must, and meaths
From many a berry, and from sweet kernels pressed
She tempers dulcet creams ; nor these to hold
Wants her fit vessels pure ; then strews the ground
With rose and odours from the shrub unfumed.'

Here is no 'regal pomp,' no 'dishes piled,' no meretricious splendour! All chaste and simple, yet varied and abundant. The primitive purity of the Eden-life forbade the shedding of blood—the destruction of life—for the purposes of food; and consequently here we have no savoury meats, no 'fowl of game,' or 'fish from every shore,' no stately sideboard, and no fragrant wines. Innocent and nutritious fruits, gently appeasing rather than provocative of appetite, with 'inoffensive must and meaths' to satisfy the promptings of thirst—not rich and costly wines to tempt the cloying palate to intoxicating excess. The description is perfect—unless, perhaps, we might be permitted to ask (though it is almost heresy even to hint a fault in so complete a master of 'the proprieties' as Milton) how the conventional word *board* (in 13th line) has been permitted to slip into such a passage?—especially when, in a few lines afterwards, we are told that

— ' Raised of grassy turf
Their table was.'

Yet the poet may have used it only as a convenient common synonyme for table, intentionally overlooking its purely conventional origin.

We feel it to be a kind of falling away to leave the company of the heavenly muse of Milton for that of any lesser master of song. But variety is always pleasing; and without indulging in any remarks of our own, which seem less called for in the present case, we shall at once lead our readers to the feast spread forth in the gardens of Shalimar for the imperial Selim. We suppose we need scarcely add that we quote from Moore's beautiful poem of 'Lalla Rookh;' a work scarcely less distinguished for the vast amount of characteristic learning which it displays, than for its exquisite poetical beauties. The research of the author, his perfect knowledge of Eastern localities, manners, histories, legends, and fables, are even visible throughout our short extract :—

' The board was spread with fruits and wine :
With grapes of gold, like those that shine
On Casbin's hills—pomegranates full
Of melting sweetness, and the pears,
And sunniest apples that Cabul
In all its thousand gardens bears ;
Plantains, the golden and the green,
Malaga's nectared mangusteen ;
Fruites of Bokhara, and sweet nuts
From the far groves of Samarcand,
And Basra dates, and apricots,
Seed of the sun, from Iran's land ;
With rich conserve of Viana cherries,
Of orange flowers, and of those berries
That, wild and fresh, the young gazelles
Feed on in Erac's rocky dells.
All these in richest vases smile,
In baskets of pure sandal-wood,
And urns of porcelain from that isle
Sunk underneath the Indian flood,
Whence oft the lucky diver brings
Vases to grace the halls of kings.
Wines, too, of every clime and hue,
Around their liquid lustre threw ;
Amber Rosolli—the bright dew

From vineyards of the Green-Sea gushing ;
And Shiraz wine, that richly ran
As if that Jewel, large and rare,
The ruby for which Kubli-Khan
Offered a city's wealth, was blushing
Malted within the goblets there !'

Our next transition is not so great or sudden. To step from Milton to Moore is to descend from the golden clouds to something like ordinary earth ; but to pass from Moore to Byron is only crossing the boundary of two tangent dominions of poesy. The table, then, which we are next to look upon, though similar in some of its features to those already described, is quite different in its general air and character. The poet is describing the feast given by Haidée to her lover in the dwelling of her pirate father. He tells us that they

— ' Sate
At wassall in their beauty and their pride :
An Ivory inlaid table spread with state
Before them, and fair slaves on every side ;
Gems, gold, and silver formed the service mostly,
Mother-of-pearl and coral the less costly.

The dinner made about a hundred dishes ;
Lamb and pistachio nuts—in short, all meats,
And saffron soups, and sweet breads ; and the fishes
Were of the finest that e'er founced in nets,
Drest to a Sybarite's most pampered wishes ;
The beverage was various sherbets
Of raisin, orange, and pomegranate Juice,
Squeezed through the rind, which makes it best for use.

These were ranged round each in its crystal ewer,
And fruits and date-bread leaves closed the repast ;
And Mocha's berry, from Arabia pure,
In small fine china cups came in at last ;
Gold cups of filigree made to secure
The hand from burning underneath them placed :
Cloves, cinnamon, and saffron too were boiled
Up with the coffee, which (I think) they spoiled.'

How lightly touched, and yet how vivid is this luxurious or even voluptuous picture! We can see the white and jewelled hands of the two lovers moving among the fruits and sweetmeats of the heaped-up table. We can imagine them playfully helping each other to the tempting delicacies, and talking languishingly about the blushing fruits and the sparkling wines. Yet, on the whole, this picture of a set feast by the modern poet is not so finely coloured as that which we have quoted from his elder brother, Milton; nor perhaps was it requisite that it should be so under the different circumstances. There is a sort of carelessness, an air of *dilettantism*, about Byron's description, arising perhaps from the peculiar style in which it, in common with the whole of the poem from which it is extracted, is written, that does not tell beside the seriousness of Milton's account of the Satanic feast. Milton's grand provision is calculated to fill the eye with longing, and make the mouth water with desire. We behold the rich meats and glowing fruits, and would fain stretch forth our hand to touch and taste them. But we can look at the Byronic feast-banquet with comparative indifference. Everything there is very fine and attractive in its way, but somehow or other it is not so sorely tempting to frail human senses.

But we wave our magic wand—as did Dr Snatchaway before the greedy eyes of Governor Sancho—and all these fine dishes disappear. The next poetical picture which we present to our readers deserves to be shaded by silken curtains. It is from 'The Eve of St Agnes,' a beautiful poem by that wonderful young poet Keats. It was an ancient superstition that if, on the eve of the day devoted by the rules of the Roman Catholic church to St Agnes, a maiden should observe certain appropriate rites and ceremonies before retiring to rest, she would, till midnight, enjoy sweet dreams about her lover.* Around this legend of the olden time Keats has woven one of the most beautiful poems in the English language. We do not intend to give anything

* Somewhat akin to some of the Scottish superstitions about Halloween. St Agnes's Eve, however, is nearly three months later in the season of winter than Halloween—the latter being in October, the former in January.

but the merest glimpse of the sunny brightness of this poetic gem; but it is necessary to the right understanding of the general character of our extract, that we should preface it by the information that Madeline—a beautiful young lady—has observed the necessary rites, and gone to sleep *fasting* (an important part of the charm, it would seem), in the hope of dreaming of her lover Porphyro, and that *he* has gained admittance to her chamber, with the view of persuading her to steal away with him from among her cruel kinsmen, to his home 'beyond the southern moors.' He prepares for her a slight repast, and waits her awakening, that he may by his actual presence fulfil, as it were, the visions which he hopes have visited her.

'Then by the bedside, where the faded moon
Made a dim, silver twilight, soft he set
A table, and, half-anguished, threw thereon
A cloth of woven crimson, gold, and jet. * *

And still she slept an azure-lidded sleep,
In blanched linen, smooth, and lavendered;
While he from forth the closet brought a heap
Of candied apple, quince, and plum, and gourd,
With jellies soother than the creamy curd,
And lucent syrups tinct with cinnamon;
Manna and dates, in argosy transferred
From Fez; and spiced dainties, every one,
From silken Samarcand to cedarled Lebanon.

These delicacies he heaped with glowing hand
On golden dishes, and in baskets bright
Of wreathed silver. Sumptuous they stand
In the retired quiet of the night,
Filling the chilly room with perfume light.'

How much of united delicacy and richness is here! There is no overloading, no gaudy ornament—all is chaste and refined, but at the same time exquisitely rich and luxurious. It is a collation worthy of Elysium, to be partaken of by Apollo and the Muses. It must be remembered that a fully-furnished feast would have been quite out of place on such an occasion; yet something somewhat substantial was requisite, seeing that Madeline had retired to rest fasting. Let your eye wander again, good reader, over the lines we have quoted, and think how welcome must have been such sweet provision. Nothing could be finer or more appropriate. 'Here,' says Leigh Hunt, that fine poet and exquisite critic—'here is delicate modulation, and super-refined epicurean nicety.

"Lucent syrups tinct with cinnamon."

make us read the line delicately, and at the tip-end, as it were, of one's tongue.'

We shall conclude, for the present at least, these pickings from the tables of the poets—appropriately enough—with a supper; a supper set out by Leigh Hunt himself. It is from a fine fanciful poem, one of his earlier works, entitled, 'The Feast of the Poets,' in which Apollo is represented as having descended to hold a sort of levee with the living poets of the time, and at which Byron, Campbell, Montgomery, Rogers, Scott, Crabbe, Moore, Keats, Shelley, Landor, Southey, Coleridge, Wordsworth, and others, were present. Apollo bestows upon each of them an appropriate wreath, wherewith their brows are encircled, and they all sit down to sup with him. The whole scene being purely imaginary, the poet could give full wing to his fancy; and accordingly we have a glow of magnificence worthy of the brightest dreams of the imaginative East:—

—' Rich rose the feast as an epicure's dreams,
Not epicure olive, or grossly inclined,
But such as a poet might dream he dined;
For the god had no sooner determined the fare,
Than it turned to whatever was racy and rare:
The fish and the flesh, for example, were done,
On account of their fineness, in flame from the sun:
The wines were all nectar of different smacks,
To which Muskat was nothing, nor Virginia Sac,
No, nor even Johannisberg, soul of the Rhine,
Nor Montepulciano, though king of all wine.
Then as for the fruits, ye might garden for ages,
Before you could raise me such apples and gages;

And all on the table no sooner were spread,
Than their cheeks next the god blushed a beautiful red.
'Twas magic, in short, and deliciousness all.
The very men-servants grew handsome and tall;
To velvet-hung ivory the furniture turned,
The service with opal and adamant burned,
Each candlestick changed to a pillar of gold,
While a bundle of beams took the place of the mould,
The decanters and glasses pure diamond became,
And the corkcraw ran solidly round into flame:
In a word, so completely forestalled were the wishes,
E'en harmony struck from the noise of the dishes.'

But we must linger no longer amid such tempting fare, lest we get intoxicated even with the fumes. We trust, however, that we have given specimens sufficient to show that poetry can, when it chooses, deal successfully with very commonplace subjects. As for those who seriously object to it on opposite grounds, we do not hesitate to say that the fault is in themselves. They are incapable of understanding or appreciating it. Such persons cannot of course be expected to enjoy the fine descriptions which we have been quoting; nor can they, we will even venture to affirm, enjoy to their full extent, or in their finer elements, the realities of such descriptions; while, on the other hand, a poetical mind is always able to add charms to actual delights of whatever class or quality they may be—to draw forth riches from its own exhaustless stores wherewith to crown the feast, or fill the cup to overflowing.

VEGETABLE CURIOSITIES.

THE vegetable kingdom has often supplied the natural theologian with the most striking and forcible of his illustrations in proof of the lavish goodness of the Creator. He has seen in its varied productions the exhaustless skill of the All-creative hand; in their adaptation to the wants and necessities of man, His wisdom; and in the gratifications they present to his eye and to his taste, the clear evidences, that while utility has been amply regarded, the enjoyment of the creature has been equally remembered, and abundantly provided for. With most of the utilitarian products of this kingdom we are sufficiently familiar; but with regard to its more exquisite gifts, we believe a good deal of ignorance to prevail, which it will be our endeavour, though imperfectly, to dissipate.

The Rev. Dr Walsh, in a paper upon plants growing in the neighbourhood of Constantinople, contained in the 'Horticultural Transactions,' speaks in an interesting manner of several of the gourd tribe, which grow luxuriantly in that district. One of the curious varieties was the *Cucurbita claviformis*, or 'Jonah's Gourd,' which is believed to be really that plant which was caused to grow up over the head of the prophet in a single night. It forms a beautifully green dense arbour, through which the rays even of the eastern sun are unable to penetrate; under its shade the Easterns delight to sit and smoke; while overhead the singular fruit of the plant hangs down in long, delicate, tempting clubs, somewhat like very stout candles. The fruit is not eaten in the uncooked state; but the central part being scooped out, it is filled with forcemeat, and boiled, forming a very delicate and reliable repast. Another remarkable gourd is the 'Turk's turban,' botanically the *Cucurbita cidarisformis*; in form, it is like a large quince placed on the top of a flat melon, thus bearing a pretty close resemblance to a turban. The history of its origin is curious, and more 'wonderful than true,' as we fear. A gourd was once planted in Campania, near a quince; and an affection apparently springing up between the two, the gourd came to the resolution of adopting the form of the quince in addition to its own glossy rotundity, and the result was the form we have just noticed. It is used as an excellent addition to soups. Another species is the white gourd, or *Cucurbita pepo*; this is found in the markets principally in the winter, and is commonly piled up in heaps, like cannon-balls, or more like pyramids of snow-balls. Romantic associations attach to this chaste production; it is presented at every native marriage ceremony to the married pair, and is supposed to insure peace and prosperity to them and their house. The *Momordica elaterium*, a member of the same family, is otherwise known as the 'Squirting Cucumber,' from its possessing the strange property of squirting out its contents on one of the ends being pulled or touched. It is a common piece of gardener's wit

to request one to take hold of the dangerous end, and if we consent, the face and person are covered with the acrid slimy contents of this vegetable pop-gun. Where the plant grows in abundance, they may be heard popping off pretty frequently; and by simply walking near these irritable instruments, the passenger is often shot in the eyes with great force by them. Some of this tribe occasionally reach an enormous size, particularly the mammoth or American gourd. Among many examples, one is especially recorded as having attained the colossal weight of two hundred and forty-five pounds!—a size truly monstrous.

Among delicious fruits, the tree known as the 'Tombe-rong' produces small berries of a yellow colour, and exquisite flavour. These are highly esteemed by the natives, who convert them into a beautiful sort of bread, which, curious to relate, both in colour and flavour bears the closest resemblance to our finest *gingerbread*. A tree belonging to the natural order *Ascyneceae*, produces a fruit called the 'Cream Fruit,' which is estimated by some as being the most exquisite fruit in the world. Two are always united together, and they depend from the extremity of a small branch; when wounded, they yield a quantity of fine white juice resembling sugar, or the best milk in its taste. For allaying the thirst incident to a tropical climate this fruit is invaluable; and its delicious quality gives it an appropriate estimation in the eyes of the weary traveller in those regions. Of another curious fruit produced by one of the same tribe, Dr Lindley writes—'The sages of Ceylon having demonstrated, as they say, that Paradise was in that island, and having therefore found it necessary to point out the forbidden fruit of the garden of Eden, assure us that it was borne on a species of this genus, the *Diocladia* of their country. The proof they find of this discovery, consists in the beauty of the fruit, said to be tempting in the fragrance of the flower, and in its still bearing the marks of the teeth of Eve. Till the offence was committed which brought misery upon man, we are assured that the fruit was delicious; but from that time forward it became poisonous, as it now remains.' The fruit of another tree of the same species affords a capital substitute for red currant jelly, and one of the celebrated 'cow-trees,' inhabitants of equatorial America, belongs to this natural order also. The delicious custard apples of the East and West Indies are produced by the *Anona reticulata*. It is a small, weakly, branching tree, bearing fruit about the size of a tennis-ball, which is of a dull-brown colour. The flesh is said to be of a yellowish colour, soft and sweet, being about the consistence, and sharing even much of the flavour, of a good custard. Another variety is a small tree, which bears a fruit of a greenish-yellow colour, and of the size of an artichoke, called the 'Sweet Sop.' The skin is half an inch thick, and encloses an abundance of a thick, sweet, luxurious pulp, tasting like clouted cream mixed with sugar.* Rumphius says that it has in some degree the smell and taste of rosewater, and is so delicious, that one scarcely ever tires of partaking of it. It has a complete contrast in the 'Sour Sop,' which belongs to the same species, which is a fruit of the size of a large pear, abounding in a milk-white pulp of a sweetish-acid taste. Sir Hans Sloane, in the 'Natural History of Jamaica,' particularly mentions the alligator, or avocado pear, the product of one of the *Lacerales*; the fruit is the size of a large pear, and possesses a rich delicate flavour, not unlike that of the peach; but it is described as being even more grateful. Another curious fruit is that called the 'Mamsee'; it is round and yellow, and when ripe, the rind peels off, discovering the eatable part, which has an acidulo-saccharine taste, and is of great fragrance. The tree by which it is borne reaches the size of our largest oaks.

Those who are admirers of marmalade (and we expect a vast number of our readers are guilty of that indiscretion), will learn with some surprise that nature presents the inhabitants of Surinam with the article readily confected. The fruit is called the 'Marmalade Box'; it is about the size of a large apple, and is covered with down. At first it is green, but when ripe it becomes brown, and then opens into halves like a walnut; the pulp is of a brownish colour, very sweet and tempting, and is eaten by the natives with the greatest avidity. The Brazilians boast also of a delicious fruit, the *murucija*, said to be unsurpassed in fra-

grance and flavour, possessing a pulp of a deep yellow, and exhaling a fine vinous odour. Yet it must yield to the famed mangustin of the Indian Archipelago. This exquisite production is universally esteemed, and is alike agreeable to strangers as to the inhabitants of its native country, whose pride it is. In shape and size it is like a middling apple; it has a thick purplish rind, which surrounds three or four cloves of soft snow-white pulp, which almost immediately dissolve. The flavour is extremely rich, yet never becomes luscious, nor palls on the taste; but the fruit may be eaten almost *ad libitum*. Dr Lindley says that an intelligent traveller and his companions were anxious to bring away with them some precise expression of its flavour; but after satisfying themselves that it partook of the compound taste of the pine-apple and the peach, they were obliged, after of course a series of tastings, to confess that it had many other equally delicious, but utterly inexpressible, flavours. Not only is it grateful to the strong and hearty, but even to the sickly who may eat it with impunity; and, as if to swell the list of its good attributes, it is related that Dr Solander was cured of putrid fever by eating it. A more singular, and at first a most uninviting fruit, is the 'durian'; it combines in a remarkable manner an odour the most disgusting and offensive—creating an almost insuperable aversion to the fruit—with a very rich and delicate taste. The tree is described as being something like a pear-tree; the fruit externally resembles that of the 'bread-fruit' tree, the outside being covered with tubercles. When ripe, it contains several cells, in each of which is a large seed of the size of a pigeon's egg, imbedded in a rich pulp. The taste is very curious, and has been compared to a dish commonly known in Spain under the name of '*Mangiar Blanco*,' composed of hen's flesh dressed in vinegar. The fruit really appears to partake more of an animal than vegetable nature, and never becomes sickly or cloying. The natives are passionately fond of it, and when it is to be procured, live almost wholly on its luxurious cream-like flesh. It is said soon to turn putrid. One durian is worth more than a dozen pine-apples.

The rose-apples of the East have long been had in esteem, and take a high position among the elegant delicacies of nature. In all respects, this fruit is a lovely production; it is borne by a tree called the jumbo; it is about as large as a pear; externally, it is arrayed in a coat of the most splendid red; inside, its pulp is of the loveliest white; and in perfume and taste it much resembles the rose. Some varieties of the rose-apple are so fine, as to be preserved for the king's use alone; a beautiful variety, the jamroase, is most highly perfumed with rose, while its colour is a delicate transparent pink mixed with white. The well-known guava is a fruit belonging to the same natural order—the myrtleblooms. One of the chief delicacies of the Indian desert is the fruit of the mango, the offspring of a considerable tree like a walnut. When fresh, it is of an exceedingly delicate, sweet, and acidulous flavour, and forms pickles and preserves, which are highly esteemed. Some of its varieties are as large as an infant's head, and exceed two pounds in weight. Sir William Jones, in the '*Asiatic Researches*,' mentions a very delicious fruit, known as the malura, which is curious in consequence of its possessing a fragrance strongly resembling that of the wallflower.

Chinese horticulture has long been famous for its productions, some of which are very anomalous. Marco Polo says they have some pears of most gigantic sizes: pears are at all seasons in the Chinese markets, and some appear to have been fattened up to a degree of obesity that would do good to the eyes of an agricultural prize-breeder. What would be thought in England of a pear weighing *ten pounds*, therefore somewhat of the size of a Southdown leg of mutton? Yet such this industrious traveller affirms as a fact, adding that they are white in colour, melting, and most fragrant in taste. Other authors mention pears of approximate sizes, some measuring nearly sixteen inches in circumference the long way, and upwards of a foot the round way. Their peaches, too, are equally fine; many of them are of the most beautiful colours and exquisite flavour, and some attain enormous sizes. The Chinese gardeners boast of having produced peaches weighing two pounds; and it is not for us to doubt their assertions, although we know somewhat of the elasticity of the Chinese conscience. They are also said to be possessed of the valuable secret of preserving fruit gathered in October until the succeeding January, in all its beauty, freshness, and flavour. Among other fruits, the 'flat peach' well deserves the title of

* Dr Lindley in a valuable paper upon tropical fruits in '*Horticultural Transactions*.'

all respects like a peach, except that it is flattened out into a cake: this fruit is well known at Canton; its colour is a pale yellow; when cut into, a beautiful circle of pink is seen surrounding the stone, and radiating into a mass of delicately-coloured pulp. In the indulgence of their dwarfing propensities, they manufacture, for such it is, miniature fruit-trees of various kinds by the method now become familiar to most persons. Large sums are set on the heads of those diminutive trees in proportion to their ugliness and their abundance of fruit. Venerable old plum-trees, a foot high, laden with fruit, are without a price; while finger-fruits, marygos, peaches, carambolas, and grapes, come in for subordinate attention. The beautiful orange the 'mandarin' (*Citrus nobilis*), one of the recent importations into this country, is remarkable for having a deep crimson rind when ripe, which is quite detached from the fruit. 'The whole,' writes Sir J. F. Davis, 'has a flattish aspect, and is sometimes four or five inches in diameter; and the loose skin, when broken, opens like a puff-ball, disclosing the juicy lobes surrounded with a kind of network of fibres.' The celebrated finger-fruit comes very manifestly into our category, and is a curious result of an ingenious horticulture. It is a peculiar kind of citrus, which, by some means or other, is made to run entirely into rind, the whole terminating at the head in several long narrow processes like fingers: it has hence been named 'Fo show,' or the hand of Fo. Its odour is very powerful, but is considered as very fine. 'So entirely, however, is this strange production the result of art operating upon nature, that it does not appear a second time after the plant has been purchased.' The Chinese have also some curious oranges, known as the horned oranges, from the circumstance of a number of little horn-like processes projecting from its upper end. It may be mentioned in connection with these plants, that the productiveness of the orange is something quite enormous. A single tree at St Michael's has been known to produce 20,000 oranges fit for packing, exclusively of about one-third more of damaged fruit. Mr Fortune supplies a curious account of the production of 'vegetable tallow.' The seeds of the tallow-tree, after having been steamed and bruised, are heated over the fire; the tallow is thus completely separated, but it looks like coarse linseed meal; subjected to expression, it exudes in a semi-fluid state, and beautifully white, soon hardening and becoming solid. It is then made into cakes, and exposed for sale in the markets, for the manufacture of candles; but as these are apt to get soft, they are often dipped in wax of various colours, and sometimes are finely ornamented. But this is a subject with an unconquerable tendency to expansion; let us therefore, having gone thus far, take a hasty leave of it at once.

THE ARTIST'S FIRST WORK.

Nor far from the splendid Palazzo Falliero at Possagno, in the Venetian states, stood the humble cabin of an aged mason named Pasino. One evening that, wearied with his work, he lay sleeping soundly after the labours of the day, he was suddenly awakened by a loud knock at the door of his cabin. He rose, ran hastily to open it, and notwithstanding the darkness of the night, perceived that it was a little boy who stood without.

'Who are you, and what do you want here?' brusquely inquired Pasino.

'Antonio,' replied the timid voice of a child.

'What Antonio?'

'Your own Antonio, dear grandpapa.'

'Is it thou, my child? And what has happened then?' said the mason, quickly changing his tone, and drawing the little fellow kindly towards him, whilst he sought even by the faint light of the moon to read in his countenance what unexpected cause could have occasioned this late visit. 'But speak then, my child! Why hast left thy mother?—Is she ill?—Hast displeased her?—Has she turned you out of doors?'

'No: I left home of my own accord.'

'And for what reason?' again inquired the old man, as he led the child into his cabin, and struck a light. 'Madonna Santissima! why did you leave your mother?' Pasino had now succeeded in lighting a lantern, and was able more plainly to examine his grandson's countenance. He then perceived that the child was in tears,

and carried a small bundle slung on the point of a stick over his shoulder.

'I could not stay any longer at home,' said the boy, as he threw his little packet on the floor. 'I was no longer master there; some one else had everything his own way. Oh what a country boor that Venetian is! If I were only ten years older, I would turn him out of the house. Alas! why am I only eleven years old?'

'And a pretty rogue you are,' said the grandfather, laughing at the childish passion of Antonio. 'So you want to be master in your mother's house?'

'When my father died, he left no other son: I am therefore the head of the house.'

'A fine house truly!' replied the old man, who was by this time thoroughly awakened from his slumbers: 'four stakes, a few stones, and a little straw! If it were a palace indeed, like that of Falliero, it would be something worth talking of.'

'Falliero!—Falliero!' said the child, as he shook his little head in a determined manner; 'one may have spirit without belonging to the rich house of Falliero.'

'Tell me, Antonio, will you have some supper?' interrupted the old man.

'No: I am not hungry.'

'But you have had a long way to walk from your mother's.'

'Only three miles: what is that?'

'Well, then, give me an account of your escape from home.'

'Yes, grandpapa, this is the history of it. You know that my mother contracted a second marriage with that low fellow Pasillo; and what annoyed me most about it was, that she changed her pretty name. Was it not a beautiful name, grandpapa?'

'Yes, to be sure. Well, go on.'

'And it was my own name besides; and I think it a disgrace that a son should bear one name and his mother another.'

'Yes, yes; but do finish your story, for I am going to sleep,' interrupted Pasino, drowsily turning into bed.

'The Signor Pasillo had hardly set foot within our house,' continued Antonio, 'when changes began to be made. In the first place, I was not caressed as heretofore; I was no longer given the best of everything—it was all for Signor Pasillo: I was unhappy, and they left me to myself: I complained, and they left me to complain; and no one said "What aileth thee, little one? Come to dinner—come to supper:" so I would not eat either one or the other. I took my resolution, and said to myself, "There is my grandfather, who lives alone, who loves children, who will let me do as I please if I go and live with him. There I will go; and there, if nowhere else, I shall be master." Are you gone to sleep, grandpapa, instead of listening?'

'No, no; all right! Now lie down on this fresh straw. Since you like so much to be master, I will soon make you a master—mason.'

'Oh, a mason is not the nicest trade.'

'You'll see what a nice one it is.'

'What! putting one stone on the top of another?—always stones!'

'Is it marble, then, you would wish for, you little madcap?'

'Certainly that would be better, and more honourable too.'

'Well, then, stop chattering now, and let me go to sleep.'

The next day Pasino woke Antonio early, and after having offered up together a short prayer to 'Our Lady of the Seven Sorrows,' and partaken of a frugal breakfast, they wended their way to the Falliero palace, where the mason had been working for some days past. But it was all in vain that he attempted to keep his grandchild at work, for the little fellow was always mixing up mud or squaring stones. The old man could never turn his back for a moment, but Antonio was busy making either a Venus or a Policinello, or preparing clay with his trowel for the divers figures he wished to

fashion. And if Pasino scolded him, he would say, 'But you see, grandpapa, I am so tired!'

'But what are you doing now?'

'Making a blessed Virgin and Child.'

And the poor grandfather, who for the most part could discover nothing but a shapeless mass of clay, rather than disappoint the boy, would praise the beauty of the Virgin, or the grace of the child, and prophesied that his 'little man' would one day become a famous mason, and even build palaces for the Fallieri themselves.

On the approach of the feast of St Cecilia, the Duke of Falliero gave orders that a grand banquet should be prepared in honour of the festival. Oh, if you could only have seen how many saucepans simmered on the heated braziers; how many spits groaned under the weight of pheasants, fowls, ducks, *poulardes*, strung on one after another!—If you could have had a glance at all the spiced meats, the savoury pasties, the rich jellies, the candied *confitures*, the fragrant fruits of every sort and hue, together with every variety of dainty which could please the eye or gratify the palate, it would have made your mouth water! Antonio, who had glided in amongst the cooks and assistants, opened his eyes wide, and went about admiring and smelling all these fine things, of which he had never before even formed an idea.

All on a sudden, and just as dinner was about to be served, the major-domo uttered a loud cry, and striking his forehead with his hand, as if in despair, exclaimed, 'Oh, unhappy creature that I am!—oh, unfortunate Pietro!—Madonna Santissima! I am ruined, and with me the illustrious House of Falliero!' At this moment, while the poor man was finishing his doleful soliloquy, the duke himself happened to pass, and inquired what was the matter. 'Oh, illustrious duke,' replied the major-domo, 'beat me, kill me if you will; I am a wretch, an assassin!'

The duke cut him short with the inquiry, 'Well, but explain yourself, Pietro: how is it that my honour has been compromised as well as yours? Speak, and let me understand it.'

'My banquet, may it please your excellency, which would have equalled those that were spread before the doges of Venice in the times of its greatest splendour—oh, my magnificent banquet is ruined by an act of forgetfulness, which deserves to be punished by a halter.'

'And what, then, have you forgotten?'

'The first service, my lord, is perfect—everything is composed in the most exquisite taste, the purest and most elegant style; the second corresponds to the first in every respect; the third, if possible, exceeds them both; but the fourth—the dessert—oh, Madonna Santissima! only think of the centre dish being spoiled—the very crowning piece of the whole!'

'What a piece of work about nothing!' exclaimed the little Antonio with an arch smile, as he stood in the corner of the kitchen: 'it is only to make another dish instead.'

'And can there not be another substituted?' inquired the duke.

'It is difficult—it is impossible, may it please your excellency.'

'Make some pyramid, some tower of—of something.'

'It is exactly this *something* which we are in want of; and besides, there is no time left—there is only half an hour to spare, and already the guests are beginning to arrive.'

'I should know very well what to do,' muttered Antonio to himself, 'if they would only ask my advice.'

'Well,' said the duke somewhat anxiously to Pietro, 'what course do you mean to pursue?'

'Oh, if the architecture of the banquet were not of so pure and elegant a style, we could— But no, it would ruin our reputation.'

'The architecture, do you say? Well, go hold a consultation with Pasino the mason—he may be able to help you out of the scrape. You are laughing at the idea?'

'You, Antonio, what are you whispering about over there? Go, run and call your grandfather, and tell him to come here.'

Antonio, highly amused, darted off directly, and soon came back pulling the old man along by his white apron. When the latter had been made to understand what was the matter, he shook his head, and twisting his cotton cap (which he had taken off out of respect to the duke) in his thin hand, said, 'If you wanted me now to build up a wall, or repair the capital of a pillar, or—'

'But it is to make a centre dish which is required, grandpapa,' cried Antonio, as if he were speaking to a deaf man.

'I know it,' answered Pasino.

'And cannot you, who build houses and palaces, make a simple dish?'

'Hold thy tongue, boy, and do not talk so loud before monseigneur.'

Antonio, somewhat confused at the rebuke, began to murmur impatiently, 'If they would only listen to me!'

The Duke Falliero, who had for some time admired the arch vivacity of Antonio's countenance, was struck with its expression at that moment. It bespoke contempt for so puerile a discussion; and the child's forehead was radiant with a consciousness of power. A half-malicious smile played around his mouth, while the two rosy lips, half parted, seemed so plainly about to say, 'Why do you not seek my help?' that the duke could not resist interrogating him.

'If we were to listen to you, then, what would be your counsel?' said the duke, as he playfully pulled Antonio by the ear.

'Why, my lord,' answered the boy, colouring up to his eyes on being thus addressed, 'if the Signor Pietro would only give me a bit of paste, such as is used for making ornamental cakes'—

'Do not listen to this little pickle, please your excellency!' said Pasino, at the same time motioning to the child to be silent.

'I will not only listen to him,' said the duke, 'but also desire Pietro to leave the construction of this famous dish to Antonio. Antonio, I give you *carte-blanche*; but on your part, what will you give me if you do not succeed?'

'My ears, please your excellency,' boldly replied the boy.

'Done, then,' said the duke: 'let us see what you can achieve.'

The banquet was sumptuous beyond any that the guests had ever beheld; and when the dessert was about to be served, the duke entertained the company by relating to them the history of the cook's failure, and of the opportune presumption of the little Antonio. As he spoke, the dessert made its appearance. Dish after dish was laid in exact order upon the table; but whether it arose from malice, or whether the poor Antonio had not been able to succeed, the centre of the table remained vacant, and the guests began to smile, and then to wonder, until at last their patience was well-nigh exhausted, when lo! the major-domo appeared, bearing in his hands a large dish, veiled by a light covering. It was laid before the duke, its covering removed, and a cry of admiration resounded through the hall. It was a beautiful lion, exquisitely modelled in sugared paste.

'Bravo!—bravo!' exclaimed the guests on all sides. 'Where is the confectioner, the cook, the little architect?'

'Where is the artist?' inquired the duke in an authoritative tone.

Then appeared, half concealed behind Pietro, a handsome boy, blushing and confused, but with a countenance wonderfully expressive of genius for one of such tender years. The duke perceiving in the boy the marks of decided talent, requested permission of his grandfather to take him to Venice, where he placed him under the direction of the most distinguished mas-

ters; and four years later, the young Canova—for such was the lad's name—was on his way to Rome with letters of recommendation to some of the most illustrious families in that capital.

Guided by that inspiration which belongs to genius, he carried his first letter to the Signor Volpato, from whom he desired to receive instruction; the same Volpato who gave to Italy some of its finest sculptures.

The first friendship which Antonio formed was with a youth of his own age—Raphael Morghen. After some time, he gave up painting, and devoted himself to sculpture. Here his genius led him to the very summit of glory. In 1782, Zulliano, the Venetian ambassador, after a banquet given by him to the most celebrated artists then assembled in Rome, invited the guests to accompany him to an adjoining saloon. He said he wished to show them a group newly finished by an artist whose name he had not yet announced to them. The subject was Theseus conquering the Minotaur. 'Gentlemen,' exclaimed Zulliano with an air of satisfaction, 'this work is executed by a countryman of mine. Signor Antonio Canova,' he added, seeking in the crowd for a youth who seemed modestly to shrink from notice, 'come forward to receive the congratulations which you merit.'

Canova became the most distinguished sculptor of his day, but was always the first to relate his early history to those who went to visit him in his studio; and, above all, he ever spoke with the deepest gratitude of the Signor Volpato.

May not this early passage in Canova's history encourage us to cultivate every talent which may have been committed to us with an earnest and courageous spirit, feeling assured that whatever outward obstacles may obstruct our path, a firm persevering resolution, and patient unwearied labour, will ever in the end conquer fortune, and establish for us a solid reputation?

THE ANGLO-INDIAN PRESS.

THE first Anglo-Indian journal was published sixty-seven years ago, in 1780. It was called 'Hicky's Gazette,' and is said by the Calcutta Review to have been 'full of infamous scandal—in some places so disguised, as to be almost unintelligible to the reader of the present day, but in others set forth broadly and unmistakably, and with a relish not to be concealed.' The individuals most foully attacked were frequently young ladies, their anonymous enemies, it is to be presumed, being rejected suitors; but the highest dignitaries of the government were no more spared than the weaker sex; and at length we read without any surprise the following announcement:—'Mr Hicky thinks it a duty incumbent on him to inform his friends in particular, and the public in general, that an attempt was made to assassinate him last Thursday morning between the hours of one and two o'clock by two armed Europeans, aided and assisted by a Moorman. Mr Hicky is obliged to postpone the particulars at present for want of room, but they shall be inserted the first opportunity.'

Only fifty years after this, when the journals had become numerous, Lord William Bentinck alludes to the press in his public despatches as forming a salutary check upon the public officers of government; and at a time when the native community had been roused into exasperation by the abolition of the sati, and both the civil and military services by a series of reforms and retrenchments, this dangerous engine—which had been the object of suspicion and alarm to former governors-general—was left in practical freedom. In 1835, Sir Charles Metcalfe confirmed this freedom by law; upon an assumption, as the recent historian, Mr Thornton, tells us, that 'nothing was more likely to conduce to the spread of the enlightened knowledge and civilisation, the arts and sciences of Europe, over India, than a licentious and unbridled press.'

With reference to this implied charge, the Review we have already quoted makes the following remark:—

'We wish it to be well understood in England, that the constitution of our society in India presents an insuperable obstacle to the existence of anything resembling an unscrupulous press. An unscrupulous press cannot exist anywhere without an unscrupulous public. Now there is no public—if we may be permitted to use the word at all in so narrow an acceptation—there is no public in the world of so select a character as the newspaper-reading public of India. It consists of a few classes of educated English gentlemen—military officers, the civil servants of the government, and gentlemen engaged in commercial pursuits. The Indian press has no "lower orders" for whom to pander. We have no pot-house politicians—no literary dustmen—no erudite cads—no high life below stairs—no select circles of slander-loving profligates and thieves. There is no great demand in this part of the world for intellectual, whatever there may be for gastronomical, high-seasoned dishes. The most that Indian readers look for is the Duke of Norfolk's panacea—"a pinch of curry-powder." They are not very fond of strong meat and strong drink; and no journalist having any regard for his purse, would cater for his subscribers after any other than a most orderly, a most becoming fashion, having the utmost regard for the delicacies, the proprieties of civilised life. A few failures in this respect have ere now struck a blow at the prosperity of an Indian journal, from the effects of which it has never recovered.'

There can hardly be a doubt, we think, that the freedom of the press in India has established its respectability; but the grand objection made in England, is the danger of political consequences. Our government, we are told, is a government of opinion: let us keep the natives, therefore, as much as possible in the dark; let them never suspect that there are any divisions—that there is a single discontented voice heard, or permitted to be heard, in the camp of their governors! This caution is very amusing to persons acquainted with the state of the native press in India. The Hindoo journals are full of satire, both personal and political; and what they want in order to insure the tranquillity of the country, is not concealment, but information. 'Already,' says an anonymous writer in 1840, 'the progress of India in European knowledge has placed her in a position not immediately perilous, it is true, to her government, but interesting from its parallels in history. Native satirists now lash every day the follies and vices of their rulers, and song-writers (so often the advanced guard of freedom!) give words to the inarticulate murmurs of disaffection. The Hindoo mother lulls her baby with a ballad, in which she tells him that however wise and industrious he may be, he can never hope for a hundredth part of the return obtained by Europeans; and on the occasion of the ignorant and insulting claim put forward by government to the proprietorship of the lands, a bolder strain arose, of which a translation appeared in one of the (London) Indian magazines. The following are the two last stanzas:—

"And what are we to do, my men?—my brothers, one and all,
Upon you with my loudest voice and angriest I call—
Take up your tulwars in your hand, and loudly sound the gong,
I doubt not there are thousands who will round our banner throng."

Oh great are we in numbers, and in numbers there is might—
Like a river we will pour upon our enemies in fight;
And if we strive right manfully, we shall not strive in vain,
To send our foreign tyrants back to their own homes again!"

The Anglo-Indian press of the present day is respectable not only in character, but numerical force. The editor of the Telegraph and Courier (Bombay) has been kind enough to send us some statistics, by which we find that there are twenty-seven Indian papers, five Singapore and Straits papers, and three China papers. Of these six are daily, three tri-weekly, twelve bi-weekly, nine weekly, and five uncertain. 'It will be seen from the statement we publish,' says the Telegraph and Courier, 'that Calcutta possesses three daily and four weekly papers, two of the hebdomadals, however—the "Christian Advocate" and

"Hindoo Intelligencer"—being organs of particular sections of the community. Madras has one daily, two bi-weeklies, and three tri-weeklies—the last named mode of publication being peculiar to the south-eastern presidency. In Bombay there are two dailies, a bi-weekly, and a weekly. The papers in the north of India are all issued twice a week—a convenient arrangement as regards postage, which presses with peculiar weight on the daily journals. In Ceylon, our contemporaries—with the exception of the "Morning Star," of which we have no information—likewise come under the denomination of bi-weekly. The "Friend of China," and "Straits Times," are the only bi-weeklies further east—the rest of the papers being hebdomadals. The amount of subscription is from ten rupees to sixty-four rupees annually. The aggregate subscription for twenty-four of the Indian papers is £78, 10s., the remaining three not being stated; and of five of the Chinese, Singapore, and Straits papers, seventy dollars, the remaining three not being stated. The 'Hindoo Intelligencer,' a Calcutta weekly journal, is edited by a native. The 'Kurrachee Advertiser' is lithographed. With regard to the circulation of these papers, we are in possession of no precise information. In India there are no stamps, the number of which admits of a tolerable guess in England; and the publishers, as may be supposed, are not very communicative on the subject.

Several of these journals publish a summary, which they transmit to England by each overland mail. The summary is a number containing a selection of articles published during the intervals of the mails, with such other matter as is expected to be found peculiarly interesting at home. It is, in fact, a fortnightly or monthly paper, as it may be, printed in India, and intended for circulation in Europe. This circulation, however, is much injured by the full reports of Indian intelligence that are now given by some of the daily London newspapers before the arrival of the ordinary mail, and by the comprehensive *précis* of the 'Indian News' and 'Indian Mail.' These two journals, which are as large as most of the Sunday papers, exhibit in rather a remarkable light the activity and promptitude of the metropolitan press. When the mail is delivered in London—sometimes as late as three o'clock in the afternoon—their editors and printers fasten upon the Indian and Chinese papers, and more especially the summaries; and by dint of working hard all night, are able to publish a condensation of their contents, with leading articles, and such home intelligence as is interesting to readers connected with India, in time for circulation throughout the kingdom by the eight o'clock mail of the following morning. This is of course a great accommodation to the public; but the hurry and excitement of the system has had an unfavourable effect upon literature. Formerly, there were several Indian magazines of high character published in London, but we are not aware that there is now a single individual of the class. The 'Asiatic Journal,' a most valuable and interesting work, was abandoned some years ago, confessedly on account of the injury its circulation sustained from the first in the field of these stamped newspapers.

THE PAWNBROKER'S WINDOW.

There is more philosophy of life to be learned at a pawnbroker's window than in all the libraries in the world. The maxims and dogmas which wise men have chronicled disturb the mind for a moment, as the breeze ruffles the surface of the deep, still stream, and passes away; but there is something in the melancholy grouping of a pawnbroker's window which, like a record of ruin, sinks into the heart. The household goods, the cherished relics, the sacred possessions affection bestowed, or eyes now closed in death had once looked upon as their own, are here as it were profaned: the associations of dear old times are here violated; the family hearth is here outraged; the ties of love, kindred, rank, all that the heart clings to, are broken here. It is a sad picture; for, in spite of all the glittering show, its associations are sombre. There hangs the watch, the

old chased repeater, that hung above the head of a dying parent when bestowing his trembling blessing on the poor outcast who parted with it for bread; the widow's wedding-ring is there, the last and dearest of all her possessions; the trinket, the pledge of love of one now dead, the only relic of the heart's fondest memories; silver that graced the holiday feast; the gilt-framed miniature that used to hang over the quiet mantel-shelf; the flute, the favourite of a dead son, surrendered by a starving mother to procure food for her remaining offspring; the locket that held a father's hair; or, gloomier still, the dress, the very covering of the poor is there, waving like the flag of wretchedness and misery. It is a strange sad sight to those who feel aright. There are more touching memorials to be seen at a pawnbroker's window than in all the monuments in Westminster Abbey.—*Newspaper paragraph.*

LABOUR.

The more we accomplish, the more we have to accomplish. All things are full of labour, and therefore the more we acquire, the more we care, and the more we toil, to secure our acquisitions. Good men can never retire from their works of benevolence. Their fortune is never made. I never heard of an apostle, prophet, or public benefactor retiring from their respective fields of labour. Moses, and Paul, and Peter died with their harness on. So did Luther, and Calvin, and Wesley, and a thousand others as deserving, though not so well known to fame. We are inured to labour. It was first a duty; it is now a pleasure. Still there is such a thing as over-working man and beast, mind and body. The maiming of a watch needs repose, and is the better for it. The muscles of an elephant, and the wings of a swift bird, are at length fatigued. Heaven gives rest to the earth because it needs it; and winter is more pregnant with blessings to the soil than summer with its flowers and fruits.—*A. Campbell.*

IMPORTANCE OF LISTENING WELL.

It seems paradoxical to observe that the art of listening well forms a part of the duty of conversation. To give up the whole of your attention to the person who addresses himself to you is sometimes a heavy task; but it is one which we must pay for the privileges of social life, and an early practice will render it almost an involuntary act of good-breeding; whilst consideration for others will give this little sacrifice a merit and a charm of which the lowest proof of Christian feeling can never be devoid. To listen well is to make an unconscious advancement in the power of conversing. In listening, we perceive in what the interest, in what the failure of others consists. We become, too, aware of our own deficiencies, without having them taught through the medium of humiliation. We find ourselves often more ignorant than we could have supposed it possible. We learn, by a very moderate attention to the sort of topics which please, to form a style of our own. The 'art of conversation' is an unpleasant phrase. The power of conversing well is least agreeable when it assumes the character of an art. In listening, a well-bred gentleman will gently sympathise with the speaker; or, if needs must, differ as gently. Much character is shown in the art of listening. Some people appear to be in a violent hurry whilst another speaks; they hasten on the person who addresses them, as one would urge on a horse, with 'Yes, yes. Very good. Ah!' Others sit on the full stare, eyes fixed as those of an owl, upon the speaker. From others, a loud and long laugh is, at intervals, produced, and all the company turns round to see what was the cause of the merriment. But all these vices of manner may be avoided by a gentle attention, and a certain calm dignity of manner, based upon a reflective mind and humble spirit.—*Hints to Young Ladies on their Entrance into Society.*

DEPORTMENT.

Be reserved, but not sour; grave, but not formal; bold, but not rash; humble, but not servile; patient, but not insensible; constant, but not obstinate; cheerful, but not light; rather be sweet-tempered than familiar; familiar, rather than intimate; and intimate with very few, and with those few upon good grounds.—*William Penn.*

THE NAVIE.

NAVIGATOR, or rather its abridged form of navie, is a term of recent currency in our language, and well known to apply to one engaged in railway operations—ploughing the solid land in deeper and more lasting furrows than his neighbour Jack of the ocean does his mobile element. The term, as is well known, originated in the excavating of canals for inland navigation. Canals having had their day, the labourers so employed have been fortunate in finding more extensive and profitable scope for their industry in the making of railways. The essential basis of the class is English, such the larger proportion of the navigator body being draughted from Lincolnshire, the rural parts of Lancashire, and adjoining districts. Digging trenches in the feney parts of Lincolnshire has always been a staple employment to this class of labourers; and this it probably was which originally adapted them for canal workings. The navie of this generic type possesses in a rude state those qualities and habits which give respectability to the English character. To a great degree of Danish or Saxon descent, and uncorrupted by social vices, the pure navie—taking him zoologically—is a fine animal. His large bones, great muscular energy, and love of good living, indicate his Teutonic origin, not less than his tractability, inclination for work, and downright honesty and spirit of independence. The navie of the right sort is no sham: he will give work for the money. Only treat him well, and keep him from drink, and his behaviour is unexceptionable. No human being will go through such a quantity of bodily labour with more cheerfulness.

The English navie has carried a knowledge of his craft into countries where the arts of digging and handling the spade were in their infancy. It may seem ridiculous to talk of there being 'an art' in shovelling earth into a barrow; but it is an art, and a very important one. It is quite English. The very spade is English, and so are the pickaxe and wheelbarrow. All over continental Europe, the instrument of digging is a clumsy species of adze, and that for lifting is a long pole with a small shovel at the end of it. The short shovel with a cross handle is English; the French and Germans know nothing of it, except as a new importation. With the short English spade or shovel, a navie will with ease lift, in a given space of time, six times the quantity of earth that a Frenchman will do with his long-poled instrument. He excels in the art of carrying as well as lifting. On several railway workings which we have seen on the continent, apparently under the charge of native contractors, the earth is filled into small cars or wagons, which are drawn by men or women with ropes across the soft and uneven surface of the ground. The toil and tediousness of this process are ex-

cessive; and the spectacle makes one melancholy. 'Can it be possible,' you say to yourself, 'that they don't know of the wheelbarrow?' This little vehicle, homely as it appears, is entitled to be associated with the most stupendous undertakings. Pushed along on a plank—another English invention—by a stout navie, it forms one of our most valuable machines. The great or wholesale carrying engine, however, of the navie, is the wagon on temporary rails. Of this expert mechanism the continentalists likewise knew nothing till they saw it introduced by English contractors; and after all, the car, dragged with difficulty by ropes, is still chiefly employed by them—a dozen men or women not doing the work of one horse!

The English navie, paradoxical as it may seem, is an important agent in the spread of civilisation: he carries the arts abroad, and practically expounds their operation. Now that he has shown the French the use of the pickaxe, the short shovel, the wheelbarrow and plank, and the wagon and temporary rail, we may reasonably expect that the knowledge of these improved instruments of labour will be extended over Europe. How curious! An illiterate peasant from the fens of Lincolnshire tells the learned of France and Germany things which alter the face and condition of kingdoms, and which they never heard of before! Philosophers who can discover planets, not having the ingenuity to invent a wheelbarrow! Countries affecting to stand at the head of science, yoking women in rope-harness to draw mud, and making them draw it too, in the most unscientific manner!

One thing is remarkable in the English navie—he has pitched his standard of living at a high point. He refuses to live on wishy-washy broth, or porridge, or potatoes; he must have bread, beef, bacon, beer, and coffee, all of the best kind. Uninstructed, like the English peasantry generally, he is apt to transgress the laws which govern the stomach, and suffers accordingly. In some places, whole bands of strong-bodied navies have become subject to a species of scurvy from living too long on one species of diet. The prevalent want of vegetables during the past year has perhaps contributed to aggravate this evil; and something is also due to the distance at which navies frequently are from markets. In many cases, the labour of railway digging is carried on several miles from any town or village, and it is therefore necessary for the contractors or their agents to establish temporary stores at which food can be purchased. These stores, usually called *tommy-shops*, have been the object of much unreasonable clamour. It is perhaps true that some storekeepers have done injustice as respects the prices and qualities of articles; but instances are more common of contractors losing money by their endeavours to supply the wants of their workmen. We have been assured that contractors

would rather have nothing to do with this kind of traffic; but necessity compels them to become shopkeepers. If they did not establish stores, the men would not engage with them: the navie will not go into a desert to be starved.

Another thing has excited not a little useless indignation. The contractors or their agents are accused of paying the navies by orders on the Tommy-shops for goods, instead of giving them a weekly money wage. This is no doubt an improper method of paying workmen: but who is to blame? The men, by their improvidence, are constantly in want; they absolutely depend for existence on the goods given to them on account; and it is notorious that if money, instead of money's worth, were paid daily, the money would be dissipated in drink, and there would be a continual saturnalia. The very reason why settlement is postponed till the end of a fortnight or month, instead of taking place every Saturday, is, that the great drinkings may be fewer, and that the work may not unnecessarily be interrupted. On a railway now in progress in Scotland, a large proportion of the navigator's earnings, we are told, is spent on whiskey, which the English navies speak of as 'white beer,' and consume raw in tumblers. Riots and fights have consequently been of lamentable frequency; nevertheless, considering the vast numbers of men employed at a distance from seats of authority, it is matter for surprise that so little crime has been committed. The fact is explained only by the English navie not being radically defective in good principle: he is not revengeful, mean, or avaricious. What a national disgrace that so fine a type of man elementarily should have been reared in a state of intellectual darkness scarcely differing from that of the tribes of Central Africa!

Of late years, in consequence of the rapid extension of railway labour, vast numbers of Scotch and Irish, as well as of the ordinary English labouring class, have been drawn into the ranks of the navies. To all these the original navie has been a kind of model, both as to the art of his labour and his external habits and appearance. As might be expected in a community formed of such various materials, jealousies and animosities are common. The old wars between English and Scotch still linger among navies: the Irish are exposed to ill-usage from both. Let us first speak of the Lowland Scotch. These have been drawn miscellaneously from handloom weaving and other crafts, also from among ordinary out-door labourers and ploughmen; the temptation of high wages having induced many to desert their homes to *try the line*—some in order to save a little money, and others for the sake of gross indulgences. Both classes have attained their object: the well-behaved have bettered their circumstances; the bad gone greater lengths in bad habits, and become worse. It must be admitted, however, that the better class considerably preponderates.

The Lowland Scot, being three-fourths an Englishman, and already accustomed to regular labour, easily falls into the ranks of navieism; but the Highlander usually, from his long-ingrained habits of idleness, his love of talking and snuffing, and his ignorance of English, is at first more difficult to manage. Nothing stimulates him to face railway work but positive starvation, and sometimes not even that will drag him from his hovel. We have seen it stated that Highlanders have deserted their employment on Scotch lines in order to return home and live on charity. Whether this be true to any extent, it is certain that the High-

landers are more inclined to occasional than regular labour, and therefore they require a kind of drilling before they are fit to work in gangs. Navies, it will have been observed, work to each other's hands: the wheelbarrows are run along a succession of planks in so many lifts. One set of navies take each his barrow a certain length, and having set it down to be lifted by a second set, they bring back the empty barrows which are ready for them. Thus there is a row of goers with full, and a row of comers with empty barrows. Now, this method of operation, dictated by long experience, is irreconcilable with the Highlander's ordinary conceptions. He does not like to be kept going backwards and forwards all day long with one wheelbarrow before and another behind him. It is keeping up the thing too hotly. It affords no time for snuffing. Gossip is out of the question. On this account, railway labour is apt to prove distasteful, and would be gladly exchanged for something more leisurely. But the Highlander finds other reasons for dislike of his new profession. If he be ignorant of English, or possess only a limited knowledge of it, there is the greatest possible difficulty in making him understand that wages must be paid according to capability. Fresh from Skye, he can see no philosophy in paying him less than a true navie who is master of his craft. Accordingly, believing himself to be cheated, he goes off in a pet. The best thing that could be done for the Highlands would be to teach the people English; for until this is done, they must inevitably remain strangers to the thoughts and habits of modern society.

When at length fairly initiated into, and accustomed to, railway labour, the Highlanders make a respectable class of navies. With more self-respect than the Irish, they are invariably better dressed, and however poor, they are never seen in rags. On their arrival in the low country, their garments almost uniformly consist of a small blue bonnet, a blue cloth jacket and trousers, woollen stockings, and stout shoes. Frugal in their habits, and quiet in their demeanour, they study to save a portion of their earnings with which to return home when they have accumulated enough. They are certainly, if less efficient workmen, better behaved, and more honest in their dealings than the bulk of the other navies.

We now come to the Irish, who here, as elsewhere, show peculiar qualities. The greater number of course have been small farmers or rural labourers in their own country, and have come to England for the sake of employment. The ordinary notion of the Irish being disposed to idleness may be true, for anything we know, in the land of their birth; but from all we have heard or seen, they are anything but lazy when mixed with English and Scotch, and have a fair prospect of remuneration. It may therefore be said that the Irish make good navies, when properly brought in to the work, and strengthened by feeding. A person who employs a large number of Irish navies thus writes to us of them:—"The famine and disease recently in Ireland threw a great many of her people over on our works, and most of these came the very pictures of want and wretchedness—a bundle of bones wrapped scantily in rags. A very general want of economy prevails amongst the Irish; they seem to act literally on the motto, "Sufficient for the day is the evil thereof," for they have no thought of the future. Their common diet is tea, coffee, loaf bread, butter, cheese, ham, and butcher-meat, which usually absorb the chief part of their earnings, so that very little is left, after paying their lodgings, for

clothing or a day's sickness. One good trait I have generally found amongst those on the work—a fellow-countryman is seldom refused a meal or a night's lodging, till he find means of providing such for himself. Arriving of course entirely destitute of funds, when the new-comer does go to work, he requires immediate means of subsistence; this is furnished him in the form of a note of credit from his employer to a storekeeper for his time at work converted into wages. By rigid economy, the amount of earnings might suffice to free a workman in a couple of months or so from credit notes with a store, but this is very seldom either attempted or accomplished. If he manage to clear off old scores, and have a few shillings over to expend in ardent spirits at the monthly pay, he thinks he does well; and if advised, and referred to examples of workmen on the same work, with the same pay, who contrive to save from a fourth to a half of their earnings, he tells you the thing is impossible with him, and considers he does well if he keep clear of debt. But many of them do not even act with this degree of consideration: paying their way for a time, they contrive to run some way into debt, and at the monthly pay get up the residue of their wages, and *slope*—that is, abscond to some other distant work, probably to repeat the same dishonesty. There are honourable exceptions, however, with the Irish, just as there are dishonourable ones with the Scotch, the former occurring more frequently with those who come from the north of Ireland, and have been pledged by Father Mathew to teetotalism. These incline to indulge in a costlier diet, but keep a less comfortable dwelling than the economic Scotch; yet, like the latter, they usually contrive to save a portion of their earnings, to transmit to their relatives, or take home with them.

The same writer goes on to make some general remarks:—'Exposed,' he says, 'as the navies must be, from the nature of their employment, to accidents and disease, and taking into account their usually improvident character, a question presents itself—How are they cared for in injuries or sickness? On the work with which I am conversant, it is compulsory for each man to leave sixpence at the monthly pay for a medical fund, which entitles the subscriber, in the case of accident or disease, to receive medicine and medical attendance. A mere trifle from all thus insures to each, when incapacitated for labour, the skill, medicine, and attention requisite for his treatment till restored to health; and the sensible benefit of this self-supporting medical institution amongst them is well attested by the fact, that the men themselves have requested its adoption where it did not exist, and solicited its reorganisation where it had been discontinued.

In ordinary cases of injury or ailment, the relatives and companions of the sufferer are usually kind and attentive; but if affected with fever, or other contagious ailment, the case immediately alters. The sympathies of their nature are forthwith sealed up by the terror of contagion, and the invalid is commonly either thrust out of doors or deserted. Many deaths for a time occurred amongst them from fever thus neglected. In order to obviate this grave and growing evil, a temporary hospital was erected by the contractors at their own expense, into which were received all cases of fever occurring amongst the men, where they were properly treated and cared for till restored to health. This has been a great boon not only to the men themselves, but to the whole neighbourhood, by lessening the sources of contagion, and diminishing the virulence of the disease. The ill-ventilated apartments of lodging-houses speedily concentrate the poison, and multiply the means of its dissemination.

Besides a medical fund for the care of the ailing and injured, and as a succedaneum for personal economy, so woefully deficient in most of the men, a sick fund has also been attempted, and attended with partial success. The purpose of the latter—obtained also by monthly contributions of sixpence or more—is to furnish support to invalids till they are able to resume their

labours, and likewise to bury the dead. There certainly has been some difficulty in the management of this fund, similar to what is experienced in other benefit societies—namely, the difficulty of guarding against imposition by malingering, and the expectation that every case of sickness should be suitably attended to, irrespective of the necessities of the individual. The name, in fact, has been badly chosen. Instead of sick-fund, it ought to have received the title of charitable or relief-fund, and gone to relieve cases of maiming or destitution occurring amongst the men; no one having any positive right to any stated weekly alimment when off work as an invalid, but relieved according to his necessities and the cause of his incapacity.

While sensible of the great national advantages of the labours of the navies, we cannot shut our eyes to the evils which have accompanied them in their movements. Strangers in the scene of their labours, without domestic ties, almost without a domestic existence, rendered rude by the very nature of their work, they do not in general exhibit the virtues which we expect in a settled rural population. Too often the settled people amongst whom they come are contaminated by the reckless debauchery of the navies. Much of the evil might have been avoided if railway operations had been conducted with greater deliberation, so as to admit of moral institutions attending those flying bodies of labourers. Unfortunately, in the eagerness of capital for a 'return,' all has been sacrificed to rapidity in the execution of the work. It is to be hoped that in the general slowing of railway works, time will be obtained to make some arrangements for moralising this huge mass of unregulated human nature.

HEART AND IMAGINATION; OR, THE POET AND THE PEASANT.

A YOUNG man was rambling along the skirts of the forest which separates St Marie aux Mines from Ribauvillé, and notwithstanding the approach of night, and the fog which was rapidly thickening around him, he strolled leisurely along without a thought of the lateness of the hour. His green jacket, doeskin gaiters, and the gun which rested on his shoulder, would have pointed him out as a sportsman, had not the book which peeped from his game-pouch betrayed rather the literary dreamer, to whom the pleasures of the field were only a fair pretext for the indulgence of a solitary ramble. Even at this moment, the meditative nonchalance with which he pursued his way, bespoke Arnold de Munster to be less eager in his quest of game, than intent in pursuing the phantasies of his own imagination. During the last few minutes his thoughts had wandered back to Paris, and to the home and friends whom he had left behind. He pictured to himself with regret the study, so tastefully decorated with statues and engravings, the German melodies which his sister used to sing to him, and the chosen society wont to assemble beneath their hospitable roof. Why had he given up all these enjoyments, and exiled himself in a country-house in the distant province of Alsace? Was it needful *thus* to retrieve his fortune? Or would it not be far better to make any pecuniary sacrifice, rather than dwell among the coarse and vulgar beings by whom he was here surrounded? While thus lost in perplexing thought, Arnold had walked on without considering whither the path he was pursuing might lead him. At length his reverie was dispelled by the unpleasant consciousness that the fog had melted into rain, and was penetrating his shooting-jacket. He now thought of hastening homeward, but on looking around him, perceived that he had lost his way amidst the windings of the forest, and sought in vain to discover which was the direction he ought to take. Meanwhile the daylight was fading away, the rain became heavier, and he wandered on in uncertainty through unknown paths.

His heart was beginning to fail him, when suddenly the welcome tingling of bells met his ears, and a team, conducted by a tall man clad in a blouse, appeared in sight, coming up from a by-road towards the spot where he stood. Arnold awaited his approach, and asked whether it were far to Sersberg.

'Sersberg!' repeated the teamster; 'I hope you do not reckon upon sleeping there to-night?'

'Pardon me, but I do though,' replied the young man.

'At the Château of Sersberg?' continued the peasant: 'then you must know of a railway leading to it. There are six good leagues to be traversed before you could reach the gate, and, considering the weather and the roads, they might be reckoned as twelve.'

The young man made an exclamation of surprise. He had started early in the day from the château, and had no idea he had rambled so far from it. But the peasant, on hearing of the course he had pursued, explained to him that for some hours he had been going in the wrong direction; and that, while he thought himself on the road to Sersberg, he had, in reality, been turning his back upon it. It was now too late to repair his error—the nearest village was about a league distant, and Arnold did not know the way thither; so that he found himself compelled to accept the shelter which was cordially offered by his new companion, whose farm happily lay near at hand. He accordingly joined the countryman, and attempted to enter into conversation with him; but Moser was no talker, and appeared a perfect stranger to all those ideas which habitually filled the young man's mind.

On emerging from the forest, Arnold called his attention to the magnificent horizon which lay before them, and which the last rays of the setting sun now tinged with a hue of the deepest purple. The farmer only shrugged his shoulders, and murmured in reply—'It will be a bad day to-morrow,' at the same time drawing more closely around him the *limousine* which served him for a cloak.

'I should think one can see the whole valley from this point of the road,' said Arnold, who sought to pierce through the darkness in which the base of the hill was already enveloped.

'Yes, yes,' replied Moser, shaking his head, 'this rascally hill is high enough for that. Now *there* is an invention which I don't see much use for.'

'What invention?'

'Why, the mountains to be sure.'

'You would like better to have nothing but plains?'

'What a question!' exclaimed the farmer, laughing aloud. 'You might as well ask me whether I would rather not break my horses' backs.'

'Ah, that is true,' replied Arnold in a tone of contemptuous irony: 'I forgot the horses! God ought certainly to have thought of them above all when he created the world.'

'I do not know,' Moser tranquilly replied, 'whether God should have thought of them or not; but certainly the engineers ought not to forget them when they construct a road. The horse, sir, is the labourer's best friend, without intending, however, any insult to the oxen, which have also their value.'

Arnold looked at the peasant in amazement.

'Then do you really see nothing in all which surrounds you,' asked he seriously, 'but the mere question of utility? The forest, the mountain, the clouds—do they never speak to your heart? Have you never stood still to contemplate the setting sun, or the forest lighted up by the stars, as it is at this moment?'

'Me!' exclaimed the farmer. 'Do you suppose, then, that I make almanacs? What good should I get from your star-light nights and setting suns? The important thing is to earn enough to pay for one's three daily meals, and for something to keep the cold out of one's stomach. Would monsieur like a little drop of cherry brandy? It is good, and comes from the other side of the Rhine.'

He held out a small flask to Arnold, who rejected it disdainfully.

The coarseness of the peasant renewed his regrets for the polished society he had left behind. He could hardly believe that these unhappy beings, whose lives were devoted to labour, and whose minds never seemed to rise above what was most material in all that surrounded them, could be men endued with the same nature as himself. Their *animal* existence was the same, but what an abyss between their *spirits*! Were there any inclinations common to each—any point of resemblance which might attest their original fraternity? Arnold felt each moment more inclined to doubt it. The longer he reflected, the more he became convinced that this immaterial flower of all things, to which we have given the name of poetry, was the privileged possession of a few choice spirits, while the rest of mankind vegetated in the dull limbo of a prosaic existence. Such thoughts as these communicated a sort of contemptuous nonchalance to his demeanour towards his guide, with whom he no longer attempted any conversation. Moser showed neither surprise nor annoyance at his conduct, and began to whistle a familiar air, interrupting it now and then to utter a word of encouragement to his horses.

Ere long they reached the farm, where the tingling of the little bells had announced their approach. A young boy and a middle-aged woman appeared at the same moment upon the threshold.

'It is your father!' exclaimed the woman, turning hastily back into the house, whence there immediately issued forth the joyous voices of children, who came running to the door, and pressed eagerly round the peasant.

'Wait a minute there, *marmaille*!' he exclaimed with his rough voice, whilst at the same time he drew from the cart a covered basket. 'Let Fritz unharness the horses.'

But the children continued to besiege the farmer, all talking at the same time. He stooped down to kiss them all, one after another; then suddenly raising himself up, 'Where is Johnny?' he inquired with a hurried voice, which betrayed some feeling of anxiety.

'Here, papa—here I am,' answered a feeble little voice within the doorway. 'Mamma does not like me to come out in this rain.'

'Stay, then—stay a moment,' said Moser, while he threw the reins on the backs of the unharnessed horses: 'I am coming to you, my child. Go in all of you, children, not to let him be tempted to come out.'

The three children ran joyously back to the porch, where the little Johnny stood by his mother's side. He was a pale, sickly boy; so deformed, that it was impossible to guess his age. He rested upon crutches, and his whole frame was bent and emaciated. On his father's approach, he extended his diminutive arms towards him with an expression so full of joy and love, that his wrinkled face beamed with delight. Moser lifted him up with his sinewy hands, uttering at the same time an exclamation of happiness not unmingled with emotion: 'Come, then, my little Puss!' said he; 'kiss papa, then; with both arms hug him close now. How has he been since yesterday?'

The mother shook her head. 'Always that cough,' she said in an under tone.

'Oh, papa, it is nothing,' said the little boy. 'Louis had drawn me rather too fast in my wheel chair; but I am quite well again. I feel as strong as a man.'

The peasant laid him carefully down, raised the fallen crutches, which he placed under his arms, and looked at him with an air of satisfaction. 'Don't you think he grows, wife?' said he in the tone of a man who wants to be encouraged in his own opinion. 'Walk a little way, Johnny—walk, my boy! He walks quicker and more firmly. He will do well, wife; we must only have a little patience.'

The good woman said nothing, but her glance rested upon her infirm child with such an expression of utter

despair that it made Arnold shudder. Happily for poor Moser, he saw it not.

'Come here now, all you young brood,' he continued, opening at the same time the basket which he had taken from the cart. 'There is something for everybody. Fall into rank, and hold out all hands.'

The good father had just produced three small white rolls, ornamented with gilding. Three exclamations of joy were uttered, and six little hands simultaneously started forward to receive them; but in a moment all drew back as if by instinct: 'And Johnny?' inquired with one accord all the little voices.

'What matter about Johnny?' gaily replied Moser. 'Who knows but I have brought nothing for him this evening? He shall have his share another time.'

But the child smiled, and tried to stretch over and peep into the basket. The farmer stepped back, lifted the cover, and raising his hand with an air of mock solemnity, displayed before the eyes of all a gingerbread cake, decorated with white and pink sugar-plums. There was a general exclamation of delight. Johnny himself could not suppress a feeble cry of admiration; a slight tinge of colour passed across his pale cheeks, and he stretched out his hand with an expression of joyous avidity.

'Ah, that takes your fancy, my little Puss,' exclaimed the father, whose countenance brightened at the sight of his child's pleasure. 'Take it, my old man; take it, it is only sugar and honey.'

He placed the cake in the hands of the little cripple, watched him as he slowly moved away, and then turning towards Arnold, said with some emotion, 'He is my first-born, sir: disease has somewhat deformed him; but he is as sharp as a needle, and it will be our own fault if he does not turn out a gentleman.' While speaking, he crossed the outer room, and led the way into a sort of parlour, whose whitewashed walls were decorated with a few rude engravings. On entering, Arnold perceived Johnny seated on the ground, surrounded by his brothers, amongst whom he was sharing the cake given him by his father. But each was exclaiming against the size of his share, and wanting it to be smaller; it needed all the eloquence of the little hunchback to make them accept the shares he had allotted to them.

The young huntsman looked at the scene for some moments with the deepest interest, and when the children had again left the room, he expressed his admiration of it to the farmer's wife. 'Certainly,' she replied with a smile, while at the same time a sigh escaped her, 'there are times when I think that the infirmities of our poor John are of use to our other children: amongst each other, they are slow in yielding, but not one of them can ever refuse him anything—it is a continual exercise of kindness and devotion.'

'And a fine kind of virtue it is!' interrupted Moser. 'Who could refuse anything to an innocent who has so much to suffer? It is a foolish thing for a man to say, but do you know, sir, that child always makes me feel disposed to cry. Often when I am in the fields, I begin all of a sudden to think of him. I say to myself, "Perhaps Johnny is ill, perhaps he is dead!" and then, no matter what hurry there may be for the work to be got through, I must find some pretext or other for coming home and seeing how things go on. You see he is so feeble, so suffering! If he were not loved more than others, he would be too unhappy.'

'Yes, yes,' gently replied his wife, 'the poor child is to us at once a cross and a blessing. My children, sir, are all dear to me; but when I hear upon the floor the sound of Johnny's crutches, I always feel as if it were a thrill of joy pass through me: it is a notice to me that our gracious God has not yet withdrawn the beloved child from us. It often seems to me that Johnny brings happiness to the house, like the swallow's nest built beneath the roof. If I had not to watch over him, I should feel as if I had nothing left to do.'

Arnold listened to these native expressions of tenderness with mingled interest and surprise. The good

woman called a servant to assist her in laying the cloth; and the young man, at the invitation of Moser, drew near the brushwood fire which was burning on the hearth. As he leaned against the mantelpiece, his eye rested on a small black frame wherein was enclosed a dried leaf; Moser perceived its glance.

'Ah, you are looking at my relic, I perceive,' said he laughing. 'It is a leaf from the weeping willow which grows away yonder upon the tomb of the hero! It was given to me by a Strasburg merchant, who had also served in the old regiment. I would not give the thing for a hundred crowns.'

'You attach, then, some particular idea to it?' said the young man inquiringly.

'Idea? No,' replied the peasant; 'but I too have served a campaign in the 14th Hussars—a valiant regiment, sir—which was pretty well cut up at Mon-truivail. There were only eight men left in our squadron; and so, to be sure, when the *Little Corporal* passed in front of the line, he saluted us—yes, sir—he took off his hat and saluted us! *Tonnerre!* it was worth while being killed for him! Ah! he was the father of the soldier.'

Here the peasant began to fill his pipe, with his eyes fixed upon the frame of black wood and the dried leaf. There was evidently to him in this remembrance of a wonderful destiny a whole romance of youth and of emotion. He recalled the last struggles of the Empire, in which he had borne a part; the reviews held by the emperor when his presence was still considered a pledge of victory; the brief successes of the French campaign, which were so soon followed by the disaster of Waterloo; the departure of the fallen hero; and his long agony on the rock of St Helena. All these images passed successively before the farmer's mind, and his brow became knitted—he pressed his thumb more energetically upon his pipe, and whistled in a low tone one of the marches of his old regiment.

Arnold respected the old soldier's meditations, and waited till he should himself once more break the silence. The arrival of supper awoke him from his reverie—he drew a chair to the table for his guest, and took his own place opposite.

'Come,' said he abruptly, 'let us set to work with the soup. I have taken nothing since morning but a crust of bread and two or three mouthfuls of cherry brandy. I could almost swallow a cow whole this evening; and as if to prove his assertion, he began rapidly to despatch the large basin of soup which stood before him. For a few minutes, nothing was heard but the noise of spoons, soon followed by that of knives employed in cutting up the quarter of smoked bacon, which the goodwife placed before them.

The long walk and keen air had given even Arnold an appetite which made him forget all his Parisian delicacies; the bacon seemed the best-flavoured he had ever tasted; and the cheap *vin du pays*, which constituted the sole beverage at the farmer's table, appeared to him capital.

The supper went merrily on till the farmer inquired, as if struck by a sudden thought, 'Where is Farraut? I have not seen him since my return.'

His wife and children looked at each other, and made no reply.

'Well, then, what is the matter?' said Moser, who perceived their embarrassment. 'Where is the dog? What has happened? Do answer me, Dorothy!'

'Do not be vexed, dear papa,' interrupted Johnny; 'we did not dare to tell you; but Farraut is gone off, and has not come back again.'

'Gone off! but you should have told me,' said the peasant, striking the table with his fist. 'And what road did he take?'

'The road to Garennes.'

'When was it?'

'After breakfast. We saw him go up the little path.'

'Something must have happened to him,' said Moser, rising from his seat. 'The poor animal is almost blind,

and there are sand-pits all along the road. Go, get me my goatskin cloak and my lantern; I must find poor Farraut either dead or alive.'

Dorothy went out without making any observation on the lateness of the hour, or the badness of the weather, and soon returned with the cloak and lantern.

'You value this dog much?' inquired Arnold, surprised at their anxiety.

'Not for my own sake,' replied Moser, as he lighted his pipe; 'but he did a good service to Dorothy's father. One day as he was returning from La Boutraye with the price of his bullocks, four men set on him, and would have killed him to get his money, but Farraut drove them off; and so, when the good man died two years ago, he called me to his bedside, and asked me to care for the dog as for one of his children. Those were his very words. I promised it; and it would be a shame not to keep one's word with the dead. Ho, Fritz! give me my stick: I would not, for the world, that anything should have happened to Farraut. The creature has been in the family for twenty years. He knows every one of us by our voices, and he recalls the good grandfather to mind. Give the lantern here quickly, Dorothy. Good-night, sir, and rest well till to-morrow.'

Moser wrapped himself in his goatskin and went out. The sound of his iron-tipped staff made itself heard for a few moments, and was then lost amidst the noise of the storm and rain, which was raging without.

After a long silence, the hostess proposed to show the young man the room she had prepared for him; but Arnold begged to be allowed to await the return of his host. He began to feel interested in this man, whom he had at first thought rude and vulgar-minded, and in this humble family, whose life had seemed to him so devoid of interest.

The night passed on; but no sign of Moser. The children dropped asleep one after another, and John himself, who made the longest resistance, at length yielded to the weariness which stole over him.

Dorothy, uneasy and restless, went constantly to the door to see if she could hear the sound of footsteps. Arnold tried to reassure her; but this only excited her the more. She accused Moser of never considering his own health or safety; of being always ready to sacrifice himself for others; of never being satisfied to see either man or beast suffer without doing everything to relieve them; and in proportion as she multiplied her complaints, which sounded wonderfully like praises, her anxiety became greater, and she was filled with forebodings of ill. The night before, the dog had never ceased howling, an owl had perched on the roof, and besides, it was Wednesday, always an unfortunate day to them. At last she became so miserable that the young huntsman proposed to go in search of her husband; and she was about to awaken Fritz to accompany him as a guide, when the sound of footsteps was heard outside.

'It is he!—it is Moser!' exclaimed the good woman. 'Thank God! he is safe.'

'Hollo! open quick, wife,' cried the farmer from without.

She ran to draw back the bolt, and Moser appeared with the old blind dog in his arms.

'Here he is,' cried he gaily. 'God bless me! I thought I should never find him: the poor animal had rolled to the bottom of the great quarry.'

'And did you go down there to get him?' inquired the terrified Dorothy.

'Would you have had me leave him at the bottom, to find him drowned there to-morrow?' replied the old soldier. 'I slipped along the high bank, and carried him away in my arms like a child, only I was obliged to leave the lantern behind.'

'But, good heavens, you risked your life!' exclaimed Dorothy shuddering.

He shrugged his shoulders, and said good-humouredly, 'Ah, bah! when one risks nothing, one gets nothing. I have found Farraut, that is the chief thing. If the

good grandfather looks down upon us, he will be pleased now.'

This reflection, made almost in a tone of indifference, deeply touched Arnold, who warmly grasped the peasant's hand, saying with emotion, 'You have acted like a true-hearted man, my friend.'

'In what respect?' answered Moser. 'Is it because I have saved a dog from drowning? Thank God! I have saved many a dog, and many a man too, since I was born; but not often in worse weather than to-night. Say, my good Dorothy, can you give me a glass of cogniac to warm me?'

She brought the bottle to her husband, who drank to the health of his guest, and then they all retired to rest.

The next morning was again fine; the sun shone brightly in the cloudless sky, and the birds sang sweetly on the boughs, still glittering with rain-drops. When Arnold descended from the loft where he had passed the night, he found Farraut at the door basking in the warm rays of the rising sun, while the little cripple was seated by his side, making a collar for him of the bright red berries of the wild rose. Farther on, in the outer room, the farmer sat chatting with a beggar, who came for his weekly alms. Dorothy was engaged in filling the old man's sack.

'Come, old Henri, you must have a drink before you go,' said the peasant, whilst he filled a glass for the aged beggar. 'To enable you to get through your rounds, you must have something to give you courage.'

'One always finds some here,' said the beggar with a smile. 'There are not many houses in the parish which give more liberally; and certainly there are none where what is given is given so cheerfully.'

'Hush, hush, Father Henriot,' interrupted Moser; 'why talk about such things? Take your glass, and leave it to the good God to judge the actions of other men. You know you and I have served together—we are comrades.'

The old man contented himself with shaking his head, and striking his glass with the farmer's, without further remark; but one could see that he felt more deeply the kindness with which the alms were bestowed than the gift of the alms themselves.

When he had again lifted his sack upon his shoulder, and said farewell, Moser looked after him till he had turned the corner, and then said with a sigh, 'One more homeless poor old man cast upon the world!' and added, turning to his guest, 'Perhaps you will hardly believe me, sir, but when I see a feeble aged man like that obliged to beg his bread from door to door, my heart sinks within me. I should like to be able to shelter them all under my roof, and welcome them to my table. One may argue about it as one likes, but nothing prevents such a sight from breaking the heart but the recollection that up there, above us, there is a land where those who have not received even a scanty portion here, will have double ration and double pay.'

'Ah, keep fast hold of that hope,' said Arnold; 'it alone can sustain and console us. I shall never forget the hours I have passed with you, my friend: I hope they may not be the last.'

'We shall rejoice to see you,' said the old soldier. 'If the bed in the loft is not too hard for you, and you can put up with our smoked bacon, come as often as you like, and we shall always have a hearty welcome for you.' As he thus spoke, the peasant cordially shook the hand which the young man offered him, pointed out the path he should follow, and stood on the threshold till he had turned the corner of the road and vanished from his sight.

Arnold walked on thoughtfully for some distance, with his eyes fixed upon the ground; but when he had reached the summit of the hill, he turned to cast one more look upon the farm; and as he stood watching the light smoke which curled from its chimney, a tear of grateful emotion dimmed his eye. 'O! May God protect that roof!' he earnestly exclaimed; 'for there,

where my pride saw only beings incapable of understanding the more refined sentiments of our nature, I have found those who are an example to myself. I judged hastily from the exterior, and thought all the poetry of life was wanting, because, instead of showing itself outwardly, it lay hidden within the deeper recesses of the heart. Superficial observer that I was! I spurned with my foot what seemed to me a hard unpolished flint, little thinking of the diamond hidden within.

INFLUENCE OF THE WEATHER ON THE MIND AND BODY.

General experience convinces most people that the body and the mind are both liable to be affected by the 'atmospheric influences.' Some, indeed, like Dr Johnson, may affect to treat this with ridicule, and the strong and robust may scarcely be sensible of any minute changes which the state of the weather may effect on their systems, but the more sensitive and susceptible again are fully alive to the facts; so much so, indeed, as to become in some measure living barometers. Who has not, in some part of his life at least, experienced the depressing effect of a dull rainy day on his spirits?—or who, on the contrary, has not felt the exhilaration of dry air and a bright glowing sunshine? At times, even in good health, a state of mind comes across us in which everything appears dark and gloomy; in which little ills are magnified into terrible evils; and in which casual annoyances seem as if they were to be perpetual, and never to be got over. All this may endure for a day, and we cannot account for it; but to-morrow's sun rises bright and cheerful; a wonderful change has come over our spirits; and hope and joy have suddenly taken the place of all our former sorrows. How much is man thus a creature of circumstances, and how apt is his mind thus to be unnecessarily agitated! It is right, however, that he should know this; and a few explanations of the effects of the weather on the animal system may not thus be without their use.

There are several circumstances which naturally affect the atmosphere as respects its influence on organised beings—such as its temperature, its moist or dry condition, its purity as respects admixture of other gases, and its electric condition. Hot air is always depressing and relaxing to the whole system; and as hot and highly rarefied air contains in the same bulk a smaller proportion of oxygen or vital air than cold and denser air, the lungs are thus defectively supplied with one of their chief stimulants of life. Cold air, on the contrary, is bracing and highly stimulating. Every one must have experienced the effects of these two extremes: the first in the languor, and lassitude, and oppressed breathing of a sultry summer day; the other in the exhilaration caused by a dry frosty day in winter, and the increased muscular activity and the ruddy glow of health which such weather causes. When the air is suddenly rarefied, or when a change of its constitution is about to take place, a corresponding impression is felt in the animal system; this is experienced before great storms, hurricanes, or heavy falls of rain or snow. Not only does man become sensible of this, but even the inferior animals, throughout all their grades of existence, manifest by some outward indications their feelings of the approaching change. The cattle leave their pastures often with a loud bellowing, birds wheel about in the air, and even the leech, and other small animals, become unusually agitated. Air of an elevated temperature, and when loaded with moisture, has always a depressing effect on the spirits; dry air, on the contrary, has a stimulating, and, under ordinary circumstances, an

exhilarating effect. A certain degree of moisture is absolutely necessary as a healthy condition of air; but extreme moisture or extreme dryness is prejudicial. The wind called the *sirocco*, which prevails at certain seasons of the year over those countries on the borders of the Mediterranean, exercises a very peculiar effect on the animal system. This wind comes from the arid deserts of Africa, and is extremely hot and dry. No sooner does it arrive on the shores of the Mediterranean, than it absorbs with avidity every particle of moisture up to its highest pitch of saturation; and while undergoing this change, its depressing and enervating effects are found to be most distressing. We experience something of the same kind in our east winds, which prevail along the eastern shores of Britain, especially in the spring months of the year. This east wind blows over the continent of Europe, as well as the northern parts of Asia, and is of low temperature, and deficient in moisture: as soon as it arrives on our island, it gradually absorbs both moisture and heat; and hence that peculiar dry, cold, shrivelling effect which it produces both on the bodies of animals and on all growing vegetables. This effect becomes more apparent when contrasted with a south or westerly wind. No sooner does the southerly wind gain the ascendancy—which wind blows over a long tract of ocean, and is consequently of elevated temperature, and supplied with a medium degree of moisture—than its mild and invigorating influence is felt both by the animal and vegetable kingdoms.

The *damp winds* of South America have been well described by Sir Woodbine Parish. To the north of Buenos Ayres is a very marshy district, while to the south-west lies the great chain of the Andes, separated only by the dry plains of the Pampas; and according as the wind blows from one or other of these quarters, the effects are very remarkable. By the time the north wind reaches the city, it has become so overcharged with moisture, that everything becomes instantly damp, books and boots become mildewed, keys rust even in the pocket, and good fires are necessary to keep the apartments dry. The effects produced in the human body by this humidity are a general lassitude and relaxation, opening the pores of the skin, and inducing great liability to colds, sore throats, rheumatic affections, and all the consequences of checked perspiration. As a safeguard against this state of things, the inhabitants wear woollen clothing, even though the weather be very hot; and although Europeans would prefer wearing cool cotton clothing in such a climate, they soon learn that the native inhabitants are right in the plan which they pursue. This damp wind of La Plata seems to affect the temper and disposition of the inhabitants. The irritability and ill-humour which it excites in some of them, amount to little less than a temporary derangement of their moral faculties. It is a common thing for men among the better class to shut themselves up in their houses during its continuance, and lay aside all business till it has passed; whilst among the lower orders it is always remarked that cases of quarrelling and bloodshed are much more frequent during the north wind than at any other time. In short, everything is deranged, and everybody lays the fault to one source: 'Senor es el viento norte!'—'Tis the north wind, sir! Even murderers are said to lay to it the blame of their foul deeds. No sooner, however, does the south wind, blowing from the dry and snowy summits of the Andes, set in, than health, and comfort, and peace are restored.

Physicians attribute, and with reason, the prevalence of many diseases to these different states of the atmosphere. Thus moist airs give rise to bilious affections, and in some localities and seasons, to agues; dry sharp airs, again, are inimical to all disorders of the chest and lungs. An irritable state of the nervous system, and even temporary insanity, may also occur from extreme conditions of the surrounding atmosphere. The effect of deleterious substances in the air as influencing health, is well known; hence one cause of the unhealthiness

of smoke-enveloped cities, where the air becomes contaminated with an excess of carbon, and with sulphurous and other gases. Crowded and ill-ventilated apartments are also thus inimical to health, from containing an excess of carbonic acid and a corresponding deficiency of oxygen or vital air. We know too little as yet of the effects of electricity, either in excess or deficiency, on the animal system, yet sufficient facts are apparent to convince us that health depends greatly on the electric condition of the air. A coming thunder-storm has a marked effect on the sensations of man and the inferior animals; and rapid changes of the electric condition, which always take place on sudden changes of temperature, or of states of moisture and dryness, have no doubt a great deal to do with many diseases, especially those called epidemic—such as influenza, and some kinds of fevers. The excellent reports on mortality now introduced into England, as given by Dr Farr, and those given with such accuracy by Dr Stark of Edinburgh, sufficiently exhibit the effects of climate on disease. The rate of mortality ranges almost with the range of the thermometer: our mild and temperate months exhibiting the least disease, while those either of extreme heat, or extreme cold, or of excess of moisture, invariably swell the lists of mortality.

Certain temperaments are more liable to be affected by the weather than others, and invalids and all delicate persons are more 'tremblingly alive' to its changes than the robust and healthy. While one shivers with the northern breeze, and can tell from his sensations, the moment he gets out of bed, from what quarter the wind blows, another, less alive to minute feelings, laughs at all such, and like the renowned Tam o' Shanter, 'never minds the storm a whistle.' But let none exult too much in their impenetrability, or despise the warnings or salutary precautions which are required as protection against the elements; nor, on the other hand, let the afflicted despair, or yield their thoughts too much to such depressions coming from without.

It will perhaps be of some use to the sensitive to be aware of the real nature and cause of their afflictions. They have only to call to mind that such are in many cases of a purely physical nature; that they are the lot of all flesh—the inferior animals, and even insensate plants, not being excepted; that the effects of the weather are to be met by salutary precautions, and by a resolute and resigned mind; that, like many other evils, they soon pass away; and that in such cases especially, 'though sorrow may endure for a night, joy cometh in the morning.'

The permanent influence of particular climates on the national temperature and disposition is also a curious subject of inquiry. There seem to be grounds for supposing that climate has some effect in this way; hence the superior excitability of the inhabitants of warm climates as compared to those of cold:

'The cold in clime are cold in blood:
Afric is all the sun's, and as her earth
Her human clay is kindled.'

Even within the compass of Europe, marked differences of national character are to be observed, corresponding in a certain degree to difference of climate, though no doubt differences of race and natural temperament are also to be taken into account. Thus the inhabitants of the south are more irritable and more sensitive than the cold and phlegmatic natives of the north; the liveliness of the Frenchman differs from the sedateness of the German; and the proverbial dulness of the Dutch differs as much from the energy and vivacity of the Italian.

The effects of change of climate in the cure and prevention of disease are well known to medical men; and such changes, when judiciously made, are often productive of the best effects. Thus a mild, soft, and rather moist air, is found favourable to all complaints of the chest, while a dry bracing air acts like magic on the

nervous and debilitated. Hence, too, the beneficial effects of travel, when change of air is conjoined with regular exercise of the body, and the amusement and occupation of the mind.

THE TRAPPERS OF THE ROCKY MOUNTAINS.

A work called 'Adventures in Mexico and the Rocky Mountains,' forms two parts—but very unequal parts—of the Home and Colonial Library.* One describes a journey through Mexico, by a route that has hitherto been little if at all traversed by Europeans; yet, owing to the sameness in the character of the people, and position of the country, it is but little different from the narratives of former travellers. Our author, however, shows that the obvious arrest of social progress in Mexico is in a great degree owing to physical causes; the fertile table-lands of the central region being cut off from easy traffic with the coast, and the entire population of 8,000,000 scattered over an area of 1,312,850 square miles, being distributed in isolated departments, distinct in interests, and insecure in intercommunication. The people, he tells us, rank decidedly low in the scale of humanity. They are treacherous, cunning, indolent, and cowardly by nature, yet have that British indifference to death which is altogether distinct even from mere animal courage. He never observed a single commendable trait in the character of the Mexican—that is, of the male animal; for the women, singular as it may seem under the circumstances, are, for kindness of heart, and many sterling qualities, an ornament to their sex and to any nation.

The second, and by far the more valuable part, contains the passage of the Rocky Mountains, and the route thence to New York. There is much in this portion of the work which will be new to British readers, and probably useful in correcting the pleasant delusions of such writers as Cooper. Take the following scenic view to begin with:—'The view from this point was wild and dismal in the extreme. Looking back, the whole country was covered with a thick carpet of snow, but eastward it was seen in patches only here and there. Before me lay the main chain of the Rocky Mountains, Pike's Peak lifting its snowy head far above the rest; and to the south-east the Spanish Peaks (Cumbres Espanolas) towered like twin giants over the plains. Beneath the mountain on which I stood was a narrow valley, through which ran a streamlet bordered with dwarf oak and pine, and looking like a thread of silver as it wound through the plain. Rugged peaks and ridges, snow-clad, and covered with pine, and deep gorges filled with broken rocks, everywhere met the eye. To the eastward the mountains gradually smoothed away into detached spurs and broken ground, until they met the vast prairies, which stretched far as the eye could reach, and hundreds of miles beyond—a sea of seeming barrenness, vast and dismal. A hurricane of wind was blowing at the time, and clouds of dust swept along the sandy prairies, like the smoke of a million bonfires. On the mountain top it roared and raved through the pines, filling the air with snow and broken branches, and piling it in huge drifts against the trees. The perfect solitude of this vast wilderness was almost appalling. From my position on the summit of the dividing ridge I had a bird's-eye view, as it were, over the rugged and chaotic masses of the stupendous chain of the Rocky Mountains, and the vast deserts which stretched away from their eastern bases; while, on all sides of me, broken ridges, and chasms, and ravines, with masses of piled-up rocks and uprooted trees, with clouds of drifting snow flying through the air, and the hurricane's roar battling through the forest at my feet, added to the wildness of the scene, which was unrelieved by the slightest vestige of animal or human life. Not a sound either of bird or beast was heard; indeed the hoarse

* By George F. Ruxton, Esq. Murray.

and stunning rattle of the wind would have drowned them, so loud it roared and raved through the trees.'

Even the lowlands in such a region are not without their terrors. 'The black threatening clouds seemed gradually to descend until they kissed the earth, and already the distant mountains were hidden to their very bases. A hollow murmuring swept through the bottom, but as yet not a branch was stirred by wind; and the huge cotton-woods, with their leafless limbs, loomed like a line of ghosts through the heavy gloom. Knowing but too well what was coming, I turned my animals towards the timber, which was about two miles distant. With pointed ears, and actually trembling with fright, they were as eager as myself to reach the shelter; but before we had proceeded a third of the distance, with a deafening roar the tempest broke upon us. The clouds opened and drove right in our faces a storm of freezing sleet, which froze upon us as it fell. The first squall of wind carried away my cap, and the enormous hail-stones, beating on my unprotected head and face, almost stunned me. In an instant my hunting-shirt was soaked, and as instantly frozen hard; and my horse was a mass of icicles. Jumping off my mule—for to ride was impossible—I tore off the saddle-blanket and covered my head. The animals, blinded with the sleet, and their eyes actually coated with ice, turned their sterns to the storm, and, blown before it, made for the open prairie. All my exertions to drive them to the shelter of the timber were useless. It was impossible to face the hurricane, which now brought with it clouds of driving snow; and perfect darkness soon set in. Still the animals kept on, and I determined not to leave them, following, or rather being blown, after them. My blanket, frozen stiff like a board, required all the strength of my numbed fingers to prevent it being blown away; and although it was no protection against the intense cold, I knew it would in some degree shelter me at night from the snow. In half an hour, the ground was covered on the bare prairie to the depth of two feet, and through this I floundered for a long time before the animals stopped.

'The way the wind roared over the prairie that night—how the snow drove before it, covering me and the poor animals partly—and how I lay there, feeling the very blood freezing in my veins, and my bones petrifying with the icy blasts which seemed to penetrate them—how for hours I remained with my head on my knees, and the snow pressing it down like a weight of lead, expecting every instant to drop into a sleep from which I knew it was impossible I should ever awake—how every now and then the mules would groan aloud and fall down upon the snow, and then again struggle on their legs—how all night long the piercing howl of wolves was borne upon the wind, which never for an instant abated its violence during the night—I would not attempt to describe. I have passed many nights alone in the wilderness, and in a solitary camp have listened to the roarings of the wind and the howling of wolves, and felt the rain or snow beating upon me, with perfect unconcern; but this night threw all my former experiences into the shade, and is marked with the blackest of storms in the memoranda of my journeyings.'

But we must now come to the most interesting portion of the work—a description of the trappers of the Rocky Mountains, who, according to our author, appear to approximate more to the primitive savage than perhaps any other class of civilised man. Their lives are spent in the remote wilds of the mountains, and their habits and character exhibit a mixture of simplicity and ferocity, impressed upon them, one would think, by the strange phenomena of nature in the midst of which they live. Food and clothing are their only wants, and the pursuit of these is the great source of their perils and hardships. With their rifle habitually in their hand, they are constantly on the watch against danger, or engaged in the supply of provisions.

* keen observers of nature, they rival the beasts of prey in discovering the haunts and habits of game, and

in their skill and cunning in capturing it. Constantly exposed to perils of all kinds, they become callous to any feeling of danger, and destroy human as well as animal life with as little scruple, and as freely, as they expose their own. Of laws human or Divine, they neither know nor care to know. Their wish is their law, and to attain it, they do not scruple as to ways and means. Firm friends and bitter enemies, with them it is "a word and a blow," and the blow often first. They may have good qualities, but they are those of the animal; and people fond of giving hard names call them revengeful, bloodthirsty, drunkards (when the wherewithal is to be had), gamblers, regardless of the laws of *mum and tum*—in fact, "white Indians." However, there are exceptions, and I have met honest mountain-men. Their animal qualities, however, are undeniable. Strong, active, hardy as bears, daring, expert in the use of their weapons, they are just what uncivilised white man might be supposed to be in a brute state, depending upon his instinct for the support of life. Not a hole or corner in the vast wilderness of the "far west" but has been ransacked by these hardy men. From the Mississippi to the mouth of the Colorado of the west, from the frozen regions of the north to the Gila in Mexico, the beaver-hunter has set his traps in every creek and stream. All this vast country, but for the daring enterprise of these men, would be even now a *terra incognita* to geographers, as indeed a great portion still is; but there is not an acre that has not been passed and repassed by the trappers in their perilous excursions. The mountains and streams still retain the names assigned to them by the rude hunters; and these alone are the hardy pioneers who have paved the way for the settlement of the western country.'

Trappers are of two kinds—the hired and the free: the former being merely hired for the hunt by the fur companies, while the latter is supplied with animals and traps by the company, and receives a certain price for his furs and peltries.

There is likewise a third trapper 'on his own hook,' more independent than either. He has animals and traps of his own, chooses his own hunting-grounds, and selects his own market. From this class, which is small in number, the novelists may be supposed to select their romantic trappers, who amuse their leisure with sentiment and philosophy.

The equipment of the trapper is as follows:—'On starting for a hunt, he fits himself out with the necessary equipment, either from the Indian trading-forts, or from some of the petty traders—*coureurs des bois*—who frequent the western country. This equipment consists usually of two or three horses or mules—one for saddle, the others for packs—and six traps, which are carried in a bag of leather called a *trap-sack*. Ammunition, a few pounds of tobacco, dressed deer-skins for moccasins, &c. are carried in a wallet of dressed buffalo-skin, called a "possible-sack." His "possibles" and "trap-sack" are generally carried on the saddle-mule when hunting, the others being packed with the furs. The costume of the trapper is a hunting-shirt of dressed buckskin, ornamented with long fringes; pantaloons of the same material, and decorated with porcupine-quills and long fringes down the outside of the leg. A flexible felt-hat and moccasins clothe his extremities. Over his right shoulder and under his left arm hang his powder-horn and bullet-pouch, in which he carries his balls, flint and steel, and odds and ends of all kinds. Round the waist is a belt, in which is stuck a large butcher's-knife in a sheath of buffalo-hide, made fast to the belt by a chain or guard of steel; which also supports a little buckskin case containing a whetstone. A tomahawk is also often added, and of course a long heavy rifle is part and parcel of his equipment. I had nearly forgotten the pipe-holder, which hangs round his neck, and is generally a *gage d'amour*, and a triumph of squaw workmanship, in shape of a heart, garnished with beads and porcupine-quills.'

Thus furnished with everything that is necessary,

and having chosen the locality of his trapping-ground, he sets out on his expedition to the mountains, sometimes alone, sometimes with several more in company, as soon as the breaking up of the ice permits. Arrived on his hunting-grounds, he follows the creeks and streams, keeping a sharp look-out for "sign." If he sees a prostrate cotton-wood tree, he examines it, to discover if it be the work of beaver—whether "thrown" for the purpose of food, or to dam the stream. The track of the beaver on the mud or sand under the bank is also examined; and if the "sign" be fresh, he sets his trap in the run of the animal, hiding it under water, and attaching it by a stout chain to a picket driven in the bank, or to a bush or tree. A "float-stick" is made fast to the trap by a cord a few feet long, which, if the animal carry away the trap, floats on the water, and points out its position. The trap is baited with the "medicine," an oily substance obtained from the beaver. A stick is dipped into this, and planted over the trap; and the beaver, attracted by the smell, and wishing a close inspection, very foolishly puts his leg into the trap, and is a "gone beaver."

When a lodge is discovered, the trap is set at the edge of the dam, at the point where the animal passes from deep to shoal water, and always under water. Early in the morning, the hunter mounts his mule and examines the traps. The captured animals are skinned, and the tails, which are a great dainty, carefully packed into camp. The skin is then stretched over a hoop or framework of osier-twigs, and is allowed to dry, the flesh and fatty substance being carefully scraped (grained). When dry, it is folded into a square sheet, the fur turned inwards, and the bundle, containing about ten to twenty skins, tightly pressed and corded, and is ready for transportation.

During the hunt, regardless of Indian vicinity, the fearless trapper wanders far and near in search of "sign." His nerves must ever be in a state of tension, and his mind ever present at his call. His eagle eye sweeps round the country, and in an instant detects any foreign appearance. A turned leaf, a blade of grass pressed down, the uneasiness of the wild animals, the flight of birds, are all paragraphs to him written in nature's legible hand and plainest language. All the wits of the subtle savage are called into play to gain an advantage over the wily woodsman; but with the natural instinct of primitive man, the white hunter has the advantages of a civilised mind; and thus provided, seldom fails to outwit, under equal advantages, the cunning savage.

Yet sometimes the precautions of the white hunter are vain. The Indian, observing where he has set his traps, creeps towards them in such a way as to leave no trail, and couches patiently in the bushes till his victim comes. Then flies the arrow; and at so short a distance it rarely flies in vain. The whizz is hardly in the ear of the victim when the point is in his heart, and the exulting savage has a white scalp to carry home for the adornment of his lodge. But the balance of spoil of this kind, it must be said, is greatly in favour of the trappers, whose camp-fires, at the end of the hunt, exhibit twelve black scalps for every one their comrades have lost.

At a certain time, when the hunt is over, or they have loaded their pack-animals, the trappers proceed to the "rendezvous," the locality of which has been previously agreed upon; and here the traders and agents of the fur companies await them, with such assortment of goods as their hardy customers may require, including generally a fair supply of alcohol. The trappers drop in singly and in small bands, bringing their packs of beaver to this mountain market, not unfrequently to the value of a thousand dollars each, the produce of one hunt. The dissipation of the rendezvous, however, soon turns the trapper's pocket inside out. The goods brought by the traders, although of the most inferior quality, are sold at enormous prices:—Coffee,

twenty and thirty shillings a pint-cup, which is the usual measure; tobacco fetches ten and fifteen shillings a plug; alcohol, from twenty to fifty shillings a pint; gunpowder, sixteen shillings a pint-cup; and all other articles at proportionably exorbitant prices.

The "beaver" is purchased at from two to eight dollars per pound; the Hudson's Bay Company alone buying it by the pule, or "plew"—that is, the whole skin; giving a certain price for skins, whether of old beaver or "kittens."

The rendezvous is one continued scene of drunkenness, gambling, and brawling and fighting, as long as the money and credit of the trappers last. Seated, Indian fashion, round the fires, with a blanket spread before them, groups are seen with their "decks" of cards, playing at "euker," "poker," and "seven-up," the regular mountain-games. The stakes are "beaver," which here is current coin; and when the fur is gone, their horses, mules, rifles, and shirts, hunting-packs, and breeches, are staked. Daring gamblers make the rounds of the camp, challenging each other to play for the trapper's highest stake—his horse, his squaw (if he have one), and, as once happened, his scalp! There go "hos and beaver!" is the mountain expression when any great loss is sustained; and sooner or later, "hos and beaver" invariably find their way into the insatiable pockets of the traders. A trapper often squanders the produce of his hunt, amounting to hundreds of dollars; in a couple of hours; and, stippled on credit with another equipment, leaves the rendezvous for another expedition, which has the same result time after time; although one tolerably successful hunt would enable him to return to the settlements and civilised life, with an ample sum to purchase and stock a farm, and enjoy himself in ease and comfort the remainder of his days.

An old trapper, a French Canadian, assured me that he had received fifteen thousand dollars for beaver during a sojourn of twenty years in the mountains. Every year he resolved in his mind to return to Canada, and, with this object, always converted his fur into cash; but a fortnight at the "rendezvous" always cleaned him out, and, at the end of twenty years, he had not even credit sufficient to buy a pound of powder.

These annual gatherings are often the scene of bloody duels, for over their cups and cards no men are more quarrelsome than your mountaineers. Rifles, at twenty paces, settle all differences; and, as may be imagined, the fall of one or other of the combatants is certain, or, as sometimes happens, both fall to the word "fire."

We have already given some specimens of our author's skill in painting from nature; but the following scene, though often sketched, has rarely been treated with a freer and firmer touch. It is a scene far from unfamiliar to the trapper:—A little before sunset I descended the mountain to the springs; and being very tired, after taking a refreshing draught of the cold water, I lay down on the rock by the side of the water and fell fast asleep. When I awoke the sun had already set; but although darkness was fast gathering over the mountain, I was surprised to see a bright light flickering against its sides. A glance assured me that the mountain was on fire, and starting up, I saw at once the danger of my position. The bottom had been fired about a mile below the springs, and but a short distance from where I had secured my animals. A dense cloud of smoke was hanging over the gorge, and presently a light air springing up from the east, a mass of flame shot up into the sky and rolled fiercely up the stream, the belt of dry brush on its banks catching fire and burning like tinder. The mountain was already invaded by the devouring element, and two wings of flame spread out from the main stream, which, roaring along the bottom with the speed of a race-horse, licked the mountain side, extending its long line as it advanced. The dry pines and cedars hissed and cracked as the flame, reaching them, ran up

their trunks, and spread amongst the limbs, whilst the long waving grass underneath was a sea of fire. From the rapidity with which the fire advanced, I feared that it would already have reached my animals, and hurried at once to the spot as fast as I could run. The prairie itself was as yet untouched, but the surrounding ridges were clothed in fire, and the mules, with stretched ropes, were trembling with fear. Throwing the saddle on my horse, and the pack on the steadiest mule, I quickly mounted, leaving on the ground a pile of meat, which I had not time to carry with me. The fire had already gained the prairie, and its long dry grass was soon a sheet of flame; but, worse than all, the gap through which I had to retreat was burning. Setting spurs into Panchito's sides, I dashed him at the burning brush, and though his mane and tail were singed in the attempt, he gallantly charged through it. Looking back, I saw the mules huddled together on the other side, and evidently fearing to pass the blazing barrier. As, however, to stop would have been fatal, I dashed on, but before I had proceeded twenty yards, my old hunting male, singed and smoking, was at my side, and the others close behind her.

On all sides I was surrounded by fire. The whole scenery was illuminated, the peaks and distant ridges being as plainly visible as at noonday. The bottom was a roaring mass of flame, but on the other side, the prairie being more bare of cedar-bushes, the fire was less fierce, and presented the only way of escape. To reach it, however, the creek had to be crossed, and the bushes on the banks were burning fiercely, which rendered it no easy matter; moreover, the edges were coated above the water with thick ice, which rendered it still more difficult. I succeeded in pushing Panchito into the stream, but in attempting to climb the opposite bank, a blaze of fire was puffed into his face, which caused him to rear on end, and his hind feet flying away from him at the same moment on the ice, he fell backwards into the middle of the stream, and rolled over me in the deepest water. Panchito rose on his legs, and stood trembling with affright in the middle of the stream, whilst I dived and groped for my rifle, which had slipped from my hands, and of course sunk to the bottom. After a search of some minutes I found it, and again mounting, made another attempt to cross a little farther down, in which I succeeded, and followed by the mules, dashed through the fire, and got safely through the line of blazing brush.

Upwards of 100,000 buffalo robes find their way into the United States and Canada every year; and besides those killed by the Indians, innumerable carcasses left to rot untouched on the trail, attest the wanton brutality of the crowds of emigrants to California, Columbia, and elsewhere. Still the numbers of these animals are countless; and it will probably be many years before the reckless whites accomplish the feat of stripping the boundless prairies of their ornament and pride, and depriving the traveller of a meal. We have now only room for the following masterly description of the death of a buffalo, which will serve as an appropriate tailpiece to a more faithful portrait of the trapper of the Rocky Mountains than has probably ever before been drawn.

No animal requires so much killing as a buffalo. Unless shot through the lungs or spine, it invariably escapes; and, even when thus mortally wounded, or even strack through the very heart, it will frequently run a considerable distance before falling to the ground, particularly if it sees the hunter after the wound is given. If, however, he keeps himself concealed after firing, the animal will remain still, if it does not immediately fall. It is a most painful sight to witness the dying struggles of the huge beast. The buffalo invariably evinces the greatest repugnance to lie down when mortally wounded, apparently conscious that, when once touching mother earth, there is no hope left him. A bull, shot through the heart or lungs, with blood streaming from his mouth, and protruding tongue, his eyes rolling, bloodshot, and glazed with death, braces

himself on his legs, swaying from side to side, stamps impatiently at his growing weakness, or lifts his rugged and matted head and helplessly bellows out his conscious impotence. To the last, however, he endeavours to stand upright, and plants his limbs farther apart, but to no purpose. As the body rolls like a ship at sea, his head slowly turns from side to side, looking about, as it were, for the unseen and treacherous enemy who has brought him, the lord of the plains, to such a pass. Gouts of purple blood spurt from his mouth and nostrils, and gradually the failing limbs refuse longer to support the ponderous carcass; more heavily rolls the body from side to side, until suddenly, for a brief instant, it becomes rigid and still; a convulsive tremor seizes it, and with a low, sobbing gasp, the huge animal falls over on his side, the limbs extended stark and stiff, and the mountain of flesh without life or motion.

GLEANINGS IN BIBLIOGRAPHY.

RESEARCHES into the origin of the names applied to the various forms of written or printed documents have often engaged the attention of the curious—they have afforded matter for ingenious speculation to the antiquary, and given to the zealous bibliophile frequent opportunities

— 'painfully to pore upon a book
To seek the light of truth.'

The Hebrew word *sepher* throughout the Scriptures is generally translated *book*; it might, however, with equal truth, be rendered writing, deed, tract, or pamphlet. In the Septuagint the translation is *biblos*, and in the Vulgate *libellus*. Dr Clarke quotes from an old version of the Bible, supposed to be earlier than Wickliffe's—'Who ever schal levee his wiif, geve he to her a lybel; that is, a lytil book of forsakyng.' The *libelli*—little books—are said to have first appeared about the commencement of the Christian era; and the term *libellus* was applied to many religious and legal documents—*libellus poenitentialis*—*libellus famosus*.

When tracts first came into existence, they were mostly confined to religious subjects: their name is derived from the Latin *tractatus*, something drawn out, as a summary or treatise. 'If,' as Hazlitt says, 'books, like wings, carry us o'er the world,' it must be confessed that the lightest books are often the heaviest wings: it would be difficult, indeed, to fly with the tracts that the schoolmen threw off as matters of recreation. 'Some books,' it has been remarked, 'like the city of London, fare the better for being burnt.'

Antiquaries are in doubt as to the origin of the word *pamphlet*: various Greek derivations have been proposed, suggested probably by the syllable *pan*; in ancient times, however, paper was sometimes spelt *pampier*. The earliest known mention of the word occurs in 'Philobiblon,' a work of the fourteenth century, in which the learned and reverend author says he revalues books rather than pounds sterling—'*libros non libras*'—and '*pamfletos*' rather than '*palfridis*.' In the reign of Henry VI. the term was *pamflete*; and *pamflet* at the end of the fifteenth century. According to Dr Johnson, the derivation is from the French—*par un filet*, held by a thread; but another authority, Dr Pegge, suggests *palme feuillet*, leaf to be held in the hand. In the period of the civil wars, England was overrun with pamphlets; so fast did they multiply in the heat of party spirit, that the parliament passed a denunciation against 'pamphlet, treatise, ballad, libel, or sheet or sheets of news.' The rulers, perhaps, looking round on the popular literature of the day, anticipated the thought of a modern writer—

'Huge realms of folly, shreds of wit,
Compose the mingled mass of it.'

and so, as prudent statesmen, applied a check to overproduction. Tracts and pamphlets, nevertheless, have done, and are still doing, good service, by carrying

knowledge into quarters where larger works seldom or never penetrate; and we may say with an author of the past century, 'there's scarcely any degree of people but may think themselves interested enough to be concerned with what is published in pamphlets.'

Francis I., although called the patron of letters, issued an edict for the closing of all shops for the sale of books, under penalty of death. This severity was afterwards mitigated, yet booksellers were forbidden to sell any books but those in their catalogues, one of which was exclusively of works approved by the church. On no account whatever were they allowed to introduce books from countries out of the Roman pale. Penalty of death was also decreed against those who should sell or distribute books, or publish engravings and woodcuts, however small, without special permission from the royal authority.

According to some writers, Louis XI. of France sent Nicolas Jenson, director of the mint at Tours, about the year 1462, 'to inform himself secretly of the cutting of punches and characters, by means of which the rarest manuscripts might be multiplied by printing; and to bring away the invention subtly.' Jenson, however, from some cause, did not return to France: he established himself at Venice in 1469, where he printed the 'Epîtres de Cicéron,' and one hundred and fifty other works, during the next ten years. He applied his talent as a graver of coins with equal success and skill to the art of typography; and to him are we indebted for the introduction of the Roman character in printing. In 1563, an ordonnance was issued by Charles IX., by which printers were enjoined not to print any books whatever, 'under penalty of hanging or strangling.' Such means for the suppression of knowledge, whatever their success at the time, remind us of the attempt to stay the stream of the Danube by damming up its source. Monarchs would have done better to leave printing to work its own cure; for, according to Sismondi, 'there is as great a mortality among books as among men.' Sir Thomas Overbury tells us—

'Books are a part of man's prerogative;
In formal ink they thoughts and voices hold,
That we to them our solitude may give,
And make time present travel'd that of old.
Our life, fame pieceh longer at the end,
And books it farther backward do extend.'

The name of the Elzevirs, the famous printers of the sixteenth and seventeenth centuries, first occurs in an edition of 'Eutropius,' printed at Leyden in 1592: it is seldom or never met with in works printed after 1680. Their Bible has sold for 110 florins, Seneca for L.17, Virgil L.15, Horace L.8. Their masterpiece is an 'Imitation of Jesus Christ,' a small duodecimo of 257 pages, published in 1679; it has sold for L.6.

The Sultan Bajazet II. issued a decree in 1483 forbidding the use of printed books by the Turks, under penalty of death. This decree was afterwards confirmed by his son Selim I. in 1515, and implicitly obeyed by the Mohammedans, with equal ignorance and fanaticism, until the eighteenth century, when, in the reign of Achmet III., Seid-Effendi, who had accompanied his father, the ambassador, to the court of Louis XV. in 1720, was so much struck with the advantages of printing, that he determined his own country should participate in them. For the attainment of this object he employed the services of a Hungarian renegade, who was subsequently surnamed Basmadjy—the Printer. A memorial was drawn up, by means of which the grand vizier, Ibrahim Pacha, an enlightened protector of literature, obtained a favourable edict from the sultan. But fearful of wounding the religious scruples of his subjects, and of alarming the numerous class of copyists, Achmet forbade the printing of the Koran, the oral laws of the Prophet, the commentaries on these works, and books on jurisprudence—leaving to the industry of the printers philosophical, medical, astronomical, geographical, historical, and other scientific works. The

renegade was placed at the head of the new establishment, but the national character was against him; and notwithstanding his activity, at the time of his death, which happened in 1746, he had not been able to print more than sixteen works. The first was a Turkish and Arabic dictionary, 2 vols. folio, of which the impression was completed in 1729; the price was fixed at thirty-five piastres, by order of the sultan. In the following year a Turkish grammar appeared, a copy of which, with each leaf of a different colour, is still in existence.

Two years of constant labour were required for a copyist to transcribe the Bible carefully upon vellum. 'What time and trouble,' says Voltaire, 'must have been taken to copy correctly in Greek and Latin the works of Origen, of Clement of Alexandria, and of all the other writers called Fathers!' St Jerome says in one of his satirical letters against Rufinus, that he had ruined himself with buying Origen's works after having written with so much heat and bitterness against that author. 'Yes,' answered Rufinus, 'I have read Origen: if it be a crime, I acknowledge my guilt, and that I exhausted the whole of my wealth in purchasing his works at Alexandria.' The writer just quoted observes, that 'it is with books as with men, the small number play a great part, the rest are confounded in the crowd. Reflect,' he adds, 'that the whole known universe is governed by books except savage nations. Who are the leaders of mankind in well-governed countries? Those who know how to read and write. You do not understand Hippocrates, or Boerhaave, or Sydenham; but you put yourself into the hands of those who have read them.'

We have often looked into the substratum of history for incidental facts that might lead us to judge of the state of popular feeling in a city or town when the printing-press was first set to work. Did the inhabitants go about their ordinary avocations with the plodding unconcern induced by long habit? or did they meet by twos and threes to talk in half-doubting tones of the new mystery, savouring strongly of the supernatural, that was to make books faster than twenty copyists could write them? Were no curious and wondering crowds collected in front of the quaintly-gabled house, heretofore not more remarked than the surrounding edifices, in which the printer was shut up with his—so said the copyists—unholy mechanism? Was there no standing on tiptoe to peep in at the windows? Did no adventurous urchin climb by the projecting carvings to steal a glance through some weather-broken chink? Were there not women among the onlookers, who, as portentous whispers went round, half-wished the babe in their arms might be clerically inclined, and read the unwritten volumes so soon to see the light? Did not those about to set out on a journey put off their departure for a day, that they might first see a specimen of the wondrous craft, and carry the news with them? Did not wayfarers, arriving with dusty hose, unsling their knapsacks, and seating themselves on the opposite side of the narrow street, wait to see the upshot of an event that filled the town with wonder? Surely the magistrates and the brethren of the guilds, in furred and robed gowns, were sitting in their carved and panelled council-hall for the first sheet to be brought to them, there in grave debate to determine the question of doubtful agency? We can hardly believe that the enemies of progress succeeded in repressing all manifestation of curiosity; society had just then reached another of its culminating points. Luther, with unceremonious hand, was opening ways for the admission of light where, for ages, all had been darkness; the human mind had found a new want, and 'books, the mind incarnate, the immortality of the life that is,' were destined to supply it.

In the absence of precise information on these points, we may turn to a more recent portion of history, which future antiquaries will look back to with as much gratification as those of the present day feel in deciphering the hieroglyphics upon the bricks of Nineveh.

Printing was first introduced into the South Sea Islands in June 1817, when the first native printed books were published atimeo, in the district of Afareaitu. The king, Pomare, had taken the greatest interest in the proceedings of the missionaries, and requested that he might be sent for whenever they were ready to go to work. The composing-stick was placed in his hand, and, with some assistance, the monarch composed the first page of the spelling-book, an alphabet in capitals, and small letters. 'He visited us almost daily,' writes Mr Ellis, 'until the 30th, when, having received intimation that the first sheet was ready for the press, he came, attended by only two of his favourite chiefs. They were, however, followed by a numerous train of his attendants, &c. who had by some means heard that the work was about to commence. Crowds of the natives were already collected around the door, but they made way for him; and after he and his two companions had been admitted, the door was closed, and the small window next the sea darkened, as he did not wish to be overlooked by the people outside. The king examined, with great minuteness and pleasure, the form as it lay on the press, and prepared to try to take off the first sheet ever printed in his dominions. Having been told how it was to be done, he jocosely charged his companions not to look very particularly at him, and not to laugh if he should not do it right. I put the printer's ink-ball into his hand, and directed him to strike it two or three times upon the face of the letters; this he did, and then placing a sheet of clean paper upon the parchment, it was covered down, turned under the press, and the king was directed to pull the handle. He did so, and when the paper was removed from beneath the press, and the covering lifted up, the chiefs and assistants rushed towards it to see what effect the king's pressure had produced. When they beheld the letters black, and large, and well-defined, there was one simultaneous expression of wonder and delight.

The king took up the sheet, and having looked first at the paper, and then at the types, with attentive admiration, handed it to one of his chiefs, and expressed a wish to take another. He printed two more; and while he was so engaged, the first sheet was shown to the crowd without, who, when they saw it, raised a general shout of astonishment and joy. When the king had printed three or four sheets, he examined the press in all its parts with great care, and remained attentively watching and admiring the facility with which, by its mechanism, so many pages were printed at one time, until it was near sunset, when he left us, taking with him the sheets he had printed to his encampment on the opposite side of the bay.'

An edition of 2600 copies of this spelling-book, and another of 2300 of a catechism and collection of texts, were rapidly printed and circulated among the natives, several of whom had been instructed so far as to be able to perform the more laborious part of the presswork. By the middle of 1818, 3000 copies of the Gospel of St Luke were printed, entitled, 'Te Evanelia na Luke, iuhia ei parau Tahiti'; literally, 'The Gospel of Luke, taken out to be the language of Tahiti; with the imprint, Nenehbia i te nenei raa parau a te mau Missionari, 1818. 'Pressed at the (paper or book) presser of the Missionaries.'

The sensation created in the vicinity of the printing establishment spread over the whole island; chiefs and people crowded the office daily. 'The press soon became a matter of universal conversation; and the facility with which books could be multiplied filled the minds of the people in general with wonderful delight. Multitudes arrived from every district of Eimeo, and even from other islands, to procure books, and to see this astonishing machine. The excitement manifested frequently resembled that with which the people of England would hasten to witness, for the first time, the ascent of a balloon, or the movement of a steam-carriage. So great was the influx of strangers, that for several

weeks before the first portion of the Scriptures was finished, the district of Afareaitu resembled a public fair.'

Canoes came from distant islands, bringing cocoa-nut oil in exchange for books: on one occasion, a party who arrived late in the evening slept on the ground all night, rather than miss the chance of the first supply in the morning. But the books, to be really useful, required binding; and leather being scarce on the island, the supply was economised to the utmost. A copy half-bound in red morocco was sent to the king; the boards were formed of native cloth, made of the bark of a tree beaten together: these were, in numerous instances, covered with pieces of old newspapers, dyed purple with the juice of a species of mountain plantain. The natives learned to bind, some in thin wood; and all the animals were hunted to procure skins; dogs and cats, every creature that had hitherto lived unmolested, was killed, and the novel sight of skins hung out to dry at the door of the huts was seen throughout the island. Such was the desire to possess books, that, the narrator pursues, 'I have frequently seen thirty or forty canoes, from distant parts of Eimeo, or from some other island, lying along the beach; in each of which five or six persons had arrived, whose only errand was to procure copies of the Scriptures. For these many waited five or six weeks, while they were printing. Sometimes I have seen a canoe arrive with six or ten persons for books; who, when they have landed, have brought a large bundle of letters, perhaps thirty or forty, written on plantain leaves, and rolled up like a scroll. These letters have been written by individuals who were unable to come and apply personally for a book, and had therefore thus sent in order to procure a copy.'

Details thus minute of the first printing and diffusion of books in the cities and towns of Germany, and other places on the continent, would now be regarded with high interest. None, unfortunately, have come down to us, and we can only speculate as regards the popular feeling on the first promulgation of an art whose design was, in the language of Davy, 'for perpetuating thought in imperishable words, rendering immortal the exertions of genius, and presenting them as common property to all awakening minds—becoming, as it were, the true image of divine intelligence, receiving and bestowing the breath of life in the influence of civilisation.'

THE PLEASURES OF POVERTY.

No! reader, no! I am not a satirical fellow, about to launch poisonous words of unfeeling levity at those who are victims to the tyranny of that cruel dame; neither am I a Stoic, and desirous of proving that the absence of pleasure is as good as its presence. In no way do I wish to 'make the worse appear the better reason'; but I should like to prove, if possible, that there is *some* reason in these words, 'The pleasures of poverty.' I have some title to be heard on this subject, my dear reader, for (*entre nous*) I am, and have always been, as poor as a church mouse; and therefore you may be sure that what I am about to offer to your attention is no pretty piece of speculation, or imaginary theory, formed without the slightest knowledge of the facts.

Allow me to put some preliminary questions. In the first place, 'Who are the people who can with propriety be called *poor*?' We often hear that such and such a nobleman, with *only* ten thousand a year, is 'very poor'; and we can also call to remembrance one or two persons who have been

'Passing rich with forty pounds a year.'

At first sight, it seems impossible that both these statements can be true; and yet a little reflection shows that they may be. The village pastor may find forty pounds enough for his yearly necessities, and the man of rank may find ten thousand pounds inadequate to his expenses; in such a case, the latter is, and the former is not, poor. From these and other considera-

tions, we should define the poor as, 'All persons whose worldly wants transcend their worldly means.'

In the next place we would ask, 'Is poverty an *unmixed* evil?' From the earliest ages in which the opinions of the wise have been recorded, until the present time, they have never been so thoroughly agreed upon any subject (and they differ considerably upon most matters) as upon this one point—that all things upon earth are composed of a mixture of good and evil; there is nothing so good that it hath no taint of evil, nothing so bad that some good may not be found in it. Hence it follows that *poverty*, that 'direct curse,' is not without its redeeming points; and that though it be 'like the toad, ugly and venomous,' it

'Wears yet a precious jewel in its head.'

Since, then, we are assured that among its many pains some pleasures lie hid; and, moreover, since I pique myself upon having discovered some of the minor ones, besides perceiving important ones, discovered by wiser heads, I shall now beg leave to introduce them to the notice of the reader without further delay, giving precedence to the larger pleasures.

Nothing sharpens a man's wits like poverty; except, perhaps, love, which is, in one sense, a sort of poverty; for is not love the want of something felt to be necessary to the support and maintenance of the soul? Poverty will not actually convert an idiot into a Bacon or a Shakspeare, but it has a wonderful power of brightening dunces and quickening *slow-coaches*; and the brightness and the quickness are just so much pleasure added to the existence of the quondam dunces and *slow-coaches*.

Nothing is so efficacious in purifying and bracing a man's morals as poverty. Cincinnatus, Dentatus, Fabricius, and the other stern models of Roman virtue, would not have been so virtuous—perhaps they would not have been virtuous at all (who knows?)—if they had been rich senators of the Augustan age. Some people are of opinion that temperance, fortitude, discreet silence, and other virtues, cardinal and minor, became common at Sparta in consequence of the scarcity of ready money there. In short, if we may rely on the testimony of history, men are brave, truthful, magnanimous, in proportion to their poverty; and that the best are the poorest (always supposing they have enough to keep body and soul together). The poets, too, teach us that the golden age of every nation is that in which there is no gold in circulation.

Now, if it be true that poverty, acting upon ordinary men, tends to make them more intelligent by mental friction, and more virtuous by the deprivation of the means of vicious indulgence, it follows, as a general rule, that it must tend to make them happier. It would be superfluous talking, in these days, to show that the more intelligent and the more virtuous a man is, the happier he must be. Such an influence, acting upon extraordinary minds, will of course produce a corresponding result; and if we search the annals of true greatness in all ages, we shall find that poverty has been the nursing-mother of genius in an overwhelming majority of cases. It is poverty that has saved genius from wearing out in the enjoyment of mere mundane felicity; for all genius has an insatiable thirst for enjoyment; and if not forced very soon in its career to recognise the insufficiency of earthly pleasures to satisfy its infinite longings—if not compelled to forbear and to forego, to deny itself and to endure—it would be easily led by its instinctive demands for enjoyment to accept eagerly all the pernicious pleasures of this world—the lust of the flesh, the lust of the eyes, and the pride of life—instead of the divine joy of which it is capable, and which it can never possess, till, in some way or other, by its own will alone (which is too much to expect from a mortal), or by the assistance of circumstances, it has learned to trample on those temptations; and standing erect above them, can fix its gaze steadily on things above the earth. It is not unnecessary to

say this, because many people who have a profound admiration for genius, *per se*, have no conception of its struggles and its self-denials. They believe that men like Socrates and Pericles, Trajan and Antoninus, Alfred and Charlemagne, Wickliffe and Zuinglius, Descartes and Spinoza, Shakspeare, Sidney, and Schiller, are either born superior to the temptations to vice which rise up within ordinary men, or find little difficulty in *righting* themselves after temporary aberration. In this way their admirers often deprive them of their due share of praise. It is not for me to measure the merit of resistance in such men, but I am inclined to believe that they had generally a harder task to subdue the cravings of the lower part of their nature than ordinary men; and that the hardships of poverty, acting from without, went far to assist the workings of the higher faculties within, in most of the cases set down at random above. In the case of those who may be said to have been 'born in the purple,' either of empire or of luxury, an artificial or accidental poverty was imposed upon them, and they thus learned to control their appetites and their propensities, and to seek and find a joy which this world can neither give nor take away.

But to descend from these greater considerations of the bright side of poverty, let us now dwell on its little pleasures. Did you ever think, dear reader, of the pleasures of making sixpence do the work of a shilling? True, those who attempt the task generally find it difficult; but to people of spirit, difficult tasks are the only delightful ones. It is also true that many persons who have tried to perform the said task have failed in a signal manner, and pronounced it an impossibility. But there have been other adventurous poor persons who, like Napoleon, have trampled on impossibilities, and made their sixpences do double duty.

The ingenuity and forethought that a man must exercise in order to get a dinner for sixpence, give him more appetite for the meal than any rich man can feel by merely running his eye down the *carte* at a first-rate hotel, and selecting what he thinks he shall like best. The *embarras du choix*, in the one case, may be pleasing for a moment, but it can never be so thoroughly satisfactory as the fixed immovable necessity of the other; the chop or rasher, or *nothing*, cannot be a very embarrassing question to a well-constituted mind, that is roused to action by an empty stomach. And when each has finished his meal, which derives the greatest amount of pleasure from it? He who, with easy digestion, takes up his hat and hums a tune as he walks out of a coffee-house, and goes away again to counting-house or workshop; or he who, having achieved the *great fact* of his day—dinner—reclines in a state of somnolent repletion, waiting till such time as his overtaxed digestive organs shall have got through their business, and will suffer him to decide how he will wile away the evening?

Again: if you have five miles to go to business every day, is it not much more pleasant (and how much more healthful!) to take the omnibus one way, and walk the other, than ride both ways, as those men so often do to whom shillings and sixpences are unimportant objects? Besides, you can occasionally walk both ways, and thus afford to buy yourself a new pamphlet, or the baby a new toy.

Then there is the pleasure of making presents, which, I take it, no rich person can enjoy *properly*. Of course a rich man or woman can give away, if he or she be disposed to give; but they are not obliged to *do without* something themselves, that they may enjoy the pleasure of giving to a friend. Now, this pleasure of *doing without* is no chimerical one; and I firmly believe that, harsh and unpleasant as the practice of self-denial may seem at first, there is no virtue which, when we are accustomed to it, brings such ample and immediate returns of pleasure. Let us take a very trifling case. Which enjoys the pleasure of giving in the highest degree—the young millionaire, who lounges into a jeweller's shop, and orders half-a-dozen rings and chains

of the newest fashion to be sent as a present to his affianced bride: or the young clerk who, having heard his lady-love say she 'should so like a certain locket, in a certain shop, in a certain street,' goes off to countermand the dashing new waistcoat he ordered yesterday, and runs thence to the locket shop, and purchases the identical locket which his mistress has set her heart upon? Which enjoys the pleasure of giving most? And if we think of the result of the two presents, we shall feel that the one damsel will probably forget the giver in the multiplicity and richness of the gifts, if she be not too much accustomed to such things, and do not put them aside in her casket, to be worn when wanted; while it is ten to one that the other damsel required the locket for the sole purpose of putting into it a lock of her dear Edward or Henry's hair, which is put into it before his eyes, and, suspended by a ribbon, is placed next the heart of the happy girl, to be worn there day and night. The pleasure of a holiday or a treat is one of the pleasures of poverty. The life of the rich man is all holiday, *tant pis pour lui*; but the poor man, to whom a holiday comes once in six months or so, knows what a depth of enjoyment lurks in the word *holiday-making*.

The pleasures of contriving, and managing, and making old things look 'maist as weel's the new,' are by no means contemptible. Then that one great pleasure, which sheds its azure light over a man's whole life—the pleasure of hope that something good will turn up for him; that, if he keep on steadily and actively in a right path, he must succeed, and learn at last what are the joys of competence. This pleasure of hope is perhaps the pleasantest, as it is assuredly the best grounded, of all the pleasures of poverty. I will say no more on the subject, feeling convinced that enough has been said to suggest much more to the reader who is acquainted with it by experience; and to establish this fact in the minds of those who are not, that there is some reason, some very good sense, in these words—'The pleasures of poverty.'

THE WIVES OF WEINSBERG.

[The following vivacious piece, dashed off in the earnest hearty style of the poets of Fatherland, is extracted from one of the most brilliant of the 'books of the season.'* 'The Pictorial Gift-Book,' a full-sized quarto, with splendidly illuminated cover and frontispiece, numerous engravings, and plenty of poetry, wants nothing to recommend itself to the givers and receivers of New-Year's presents.]

The little town of Weinsberg
Is built upon a hill—
And the ladies there are famed for
Sagacity and skill:
If e'er I go a-wooing,
Whatever may betide,
The little town of Weinsberg
Shall furnish me a bride.

The mighty Kaiser Conrad,
By fancied wrongs enraged,
Together drew his forces,
And war against it waged.
By rap and enslaving
He struggled to prevail—
But its bulwarks were of granite,
Its burghers cased in mail!

Three times the veteran warriors
Redoubled the attack,
And thrice the stalwart burghers
The imperial host beat back;
But fell disease and famine
The patriots did assail—
The civic guards of Weinsberg
Could scarce support their mail!

Repulsed, and chafed to frenzy,
Dishonoured, one and all,
The despot sent a herald
Beneath the leaguered wall:

'Ye base rebellious varlets,
Lay down your arms to me,
Or every boar shall dangle
Upon the nearest tree!'

A panic spread like wildfire
Through street, and square, and lane,
And frantic words were uttered,
Both pious and profane:
'By famine or the halter,
Alas, we must expire!
I feel the noose already!'
Exclaimed a famished friar.

With wild vociferation
A shrivelled landlord cried,
'My larders all are empty,
And cannot be supplied!'
'We're lost!' cried Hans the baker;
'Undone!' rejoined a priest;
And grim old Karl, the blacksmith,
He smote his withered breast!

The iris spans the valley
When clouds obscure the sky,
And winter nights are darkest
When dawn is drawing nigh;
When lordly man's confounded,
Distracted, and distressed,
A balm is oft discovered
In woman's gentle breast.

Close to the hour of midnight,
An embassy of wives
Hied to the foe's encampment
At hazard of their lives—
Led on by Madame Lobson,
Whose bright dishevelled hair
Streamed o'er her milk-white shoulders—
A picture of despair!

She sought the chief's pavilion,
And humbly on her knee
The lovely suppliant bended,
And prayed for clemency!
Ah! vehemently she pleaded,
And copiously she wept;
But still the ruthless monarch
His fatal purpose kept.

'Go! tell that horde of traitors—
Audacious base-born thralls—
I'll hang them high as Haman,
When once I scale their walls:
I wage no war on women,
Be high or low their birth;
You're free!—So bring such treasure
As you can carry forth.'

The morning dawned serenely,
The birds were all in song,
When from the portals issued
A helpless female throng:
Each to the distant mountains
Pursued her devious track,
With terror in her boom,
Her husband on her back!

Repudiated courtiers,
They sickened at the sight;
But Conrad from his tent-door
Beheld it with delight!
'Ha! bravo!' cried the Kaiser—
And rubbed his hands with glee;
'I question if the empress
Would do as much for me.'

From turret, spire, and steeple,
The civic banners streamed;
A pardon has been granted,
An amnesty proclaimed!
A sumptuous entertainment
The almoner provides;
And Conrad at the table
In regal state presides!

Ah! how the viands vanished,
Like snow-flakes in the Rhine;
The burghers were enraptured
With loyalty and wine!
They mapped their skinny fingers,
They toasted and they drank,
Without regard to talent,
Or precedence, or rank!

'What ho! ye mopping minstrels,
Strike up a lively air!
And Conrad in a twinkling
Sprung from his regal chair,

* The Pictorial Gift-Book of Lays and Lithographs. The Poetry by David Vadder, C.M.A.S.E. Menzies, Edinburgh; Orr, London. 1868.

He danced with all the females
Who filled these spacious rooms—
Alike with rank and beauty,
And her who gathers brooms!

The little town of Weinsberg
Is built upon a hill—
The ladies there are famed for
Sagacity and skill:
If e'er I go a-wooing,
Whatever may betide,
The little town of Weinsberg
Shall furnish me a bride!

IRON CARRIAGES.

THE tendency of the last few years to substitute iron for wood has been shown in ships, ploughs, and other machines. It has even been attempted in houses; but here, we believe, without that success which is shown in extensive use or practice. A gentleman of the north of Scotland is now experimenting, with good ground of hope, on the introduction of iron carriages. He proposes that the bodies of such vehicles should be formed entirely of an iron frame, the panels of plates of galvanised iron, and the axles of iron tubes filled with wood; the wheels to have for spokes double rods pyramidally arranged, or on what is called the suspension principle. The advantages proposed are—first, a lightness as about two to three; second, a saving of cost in about the same proportion. Thus, a pony-carriage, which, of the usual materials, would weigh five hundredweight, is only about three when constructed of iron; an omnibus, which, of the ordinary construction, would be twenty to twenty-four hundredweight, can be formed of iron at about eleven. The same in respect of external decorations and internal comforts. A carriage of this kind effects an important saving in the motive power. If successful as an invention, it must be of no small importance to humanity, both in sparing the muscles of individual horses, and allowing of a greater share of the fruits of the earth being turned to the use of human beings. For use in tropical countries, there is a further advantage in the non-liability to cracking and shrinking, and the unsuitableness of an iron frame for becoming a nest of noxious insects. Apart from the mere substitution of one material for another, which is the leading feature of the invention, much is claimed for it on the ground of the superior springs employed in these carriages. They are spiral, and vertically arranged, working in a case, with an apparatus which precludes their falling from the perpendicular.

We have seen one of Mr Aitken's carriages, and taken a drive in another, without being able to detect any point in which they are likely to prove a failure. Their success, however, must be matter for larger experiment, requiring time for a satisfactory issue.

INDIAN ARROW-POISON.

Snake-like in form, the *Urari*, or Indian arrow-poison, winds itself around and among the huge trees, fantastically shaped, that spring from the deep fissures in the mountain rock, and often reaches to a height of forty feet before it divides into branches, which are densely covered with a rust-coloured hair. The poisonous principle resides chiefly in the bark of the plant, which is stripped off, steeped in water for a certain time, simmered, and evaporated to the thickness of a sirup. It is then fit for use. 'As much as I had heard of the fatal poison,' says Professor Schomburgk, 'I nevertheless cannot abstain from noting the astonishment by which I was seized on seeing it used for the first time. While travelling, a deer was discovered browsing in the high grass before us. One of the Indians took a poisoned spike, and fixed it to his arrow. Cautiously he stole upon the unsuspecting deer, and shot the arrow into its neck; it made a jump in the air, fled with the speed of the wind before us, but had scarcely run forty yards, when it fell to the ground and expired.' It will kill the strongest bull in four or five minutes; and lizards and rats wounded with it die immediately. It may appear strange that this poison may be taken into the stomach with impunity. The writer relates that, when suffering from ague, and happening to be without quinine, he took frequently the urari in doses of 'about as much as I could get on the point of a knife.' The stomach, in fact, digests the poison, and thereby alters its properties before it reaches the blood. It is also well known that the flesh of animals killed with the urari is quite innocent for the same reason.

THE WORLD WAS MADE FOR ALL.

In looking at our age, I am struck immediately with one commanding characteristic; and that is, the tendency of all its movements to expansion, to diffusion, to universality. To this I ask your attention. This tendency is directly opposed to the spirit of exclusiveness, restriction, narrowness, monopoly, which has prevailed in past ages. Human action is now freer, more unconfined. All goods, advantages, helps, are more open to all. The privileged petted individual is becoming less, and the human race are becoming more. The multitude is rising from the dust. Once we heard of the few, now of the many; once of the prerogatives of a part, now of the rights of all. We are looking, as never before, through the disguises, envelopments of ranks and classes, to the common nature which is below them; and are beginning to learn that every being who partakes of it has noble powers to cultivate, solemn duties to perform, inalienable rights to assert, a vast destiny to accomplish. The grand idea of humanity, of the importance of man as man, is spreading silently, but surely. Not that the worth of the human being is at all understood as it should be; but the truth is glimmering through the darkness. A faint consciousness of it has seized on the public mind. Even the most abject portions of society are visited by some dreams of a better condition, for which they were designed. The grand doctrine, that every human being should have the means of self-culture, of progress in knowledge and virtue, of health, comfort, and happiness, of exercising the powers and affections of a man; this is slowly taking its place, as the highest social truth. That the world was made for all, and not for a few; that society is to care for all; that no human being shall perish, but through his own fault; that the great end of government is to spread a shield over the rights of all—these propositions are growing into axioms, and the spirit of them is coming forth in all the departments of life.—*Dr Channing.*

ORIGIN OF THE HOUSE OF RUSSELL.

John Russell, a plain gentleman residing near Bridport, county of Dorset, obtained a favourable introduction to court by a piece of good fortune. The Archduke Philip of Austria, having encountered a violent hurricane in his passage from Flanders to Spain, was driven into Weymouth, where he landed, and was hospitably received by Sir Thomas Trenchard, a gentleman of the neighbourhood. Sir Thomas Trenchard apprised the court of the circumstance, and in the interim, while waiting for instructions what course to follow, he invited his cousin, Mr Russell, to wait upon the prince. Mr Russell proved so agreeable a companion, that the archduke desired him to accompany him to Windsor. He was there presented to the king, Henry VII., who likewise was so well pleased with Mr Russell, that he retained him as one of the gentlemen of the privy chamber. Being subsequently a companion of the prince, he so far ingratiated himself into young Tudor's favour, that he got elevated to the peerage, under the title of Baron Russell of Cheyneys. In the next year, 1540, when the church lands were seized, Henry gave his favourite the Abbey of Tavistock, with the extensive possessions belonging thereto. In the next reign, Russell's star being still in the ascendant, young Edward, not sixteen, gave him the monastery of Woburn. In Charles II.'s time, William, the fifth earl, was made Duke of Bedford.—*From The Right of the Aristocracy to the Soil Considered.*

JEALOUSY.

Jealousy violates contracts; dissolves society; breaks wedlock; betrays friends and neighbours; nobody is good; and every one is either doing or designing a mischief. Its rise is guilt or ill-nature, and by reflection it thinks its own fault to be other men's; as he that is overrun with the jaundice takes others to be yellow.—*Stray Thoughts.*

A SCOTCHMAN'S DESTINY.

I was born a Scotchman, and a bare one, and was therefore born to fight my way with my left hand when my right failed me, and with my teeth if both were cut off.—*Sir Walter Scott.*

INCIDENTS OF WINTER LIFE IN QUEBEC.

STRAFINGLY picturesque is the situation of Quebec. Crowning the high and precipitous cliff which terminates the promontory formed by the confluence of the St Charles with the St Lawrence, it overlooks a scenic panorama, which, for extent and variety of features, is equalled by few prospects in the world. On one side of the city, and laving its very feet, rolls the lordly St Lawrence in sullen grandeur, the high grounds of Point Levy frowning over its deep, dark channel about a mile distant on the opposite side. On the north it is flanked by the broad estuary of the St Charles, after the junction of which with the main river, the latter swells into colossal proportions, which it not only retains, but greatly enlarges during the remainder of its course to the ocean. Close to the water's edge, its northern bank is covered with a succession of villages, which extend, from opposite the city, almost the whole way down to the Falls of Montmorency, the white walls sparkling gaily in the sunlight, and contrasting pleasantly in the summer-time with the rich and luxuriant vegetation to which an extended cultivation gives rise. In the midst of the great reservoir formed by the junction of the two streams, is the island of Orleans, its nearest point to the city being about seven miles distant, and dividing the river into two great channels for the next seven leagues of its course. Of these, the southern is the narrower, and that usually taken by shipping—the northern spreading out like a great firth, and forcing its way to the foot of the mountain-chain visible in the distance; the tumultuous masses of which constitute the left bank of the river, until it empties itself, about four hundred miles from the city, into the Gulf of St Lawrence. Near the parish of St Anne, several miles below the city, where the tide rises with a rapidity equal to that of its flow in the Solway, this mountain chain suddenly leaves the river, the channel of which, as you ascend it, diverges at Quebec several degrees to the south. The hills, as they run their straight course in a direction almost due west, form, by their serried and broken outlines, a splendid background to the lovely and widely-extended landscape which stretches between them and the city. As you follow their course westerly, the sight roams over the broad valley, which lies at their feet, shrouded in the foliage of the primeval forests, and which you can trace till the eye flags in the distance. Far to the south again, and on the opposite side of the St Lawrence, you have the distant uplands of Megantic, about midway between you and the American boundary. From the more elevated points of the city, the eye on all hands commands a prospect of nearly fifty miles in extent, replete with all the elements which enter into the formation of a perfect landscape. Over this glorious combination of

land and water, mountain and valley, forest and corn-field, town, hamlet, and village, floats the proud emblem of England's supremacy from the highest point of Cape Diamond.

Gorgeous as is the prospect in the summer-time, it is dreary and desolate when all around is wrapped in the frigid mantle of winter. From its position, Quebec is peculiarly liable to extremes of cold and heat: in the summer-time, the thermometer is not unfrequently for days at 100 degrees in the shade; whilst it sometimes descends, in the opposite season, as low as 40 degrees below zero, or 72 degrees below freezing-point, on Cape Diamond, which is the loftiest part of the Citadel. Some years ago, the Government-House fell a prey to the flames in the depth of winter. Numerous fire-engines were on the spot, but they were unavailable; for the water congealed into a solid mass in its passage through the hose-pipes: nor did it mend the matter that they were afterwards supplied with boiling water from the breweries.

Quebec, on the approach of winter, is as if in a partial state of siege. This is chiefly perceptible in the increase which generally takes place in the price of provisions and firewood. During the summer months, the town is abundantly supplied with the one, whilst it is only for culinary purposes that it is in want of the other. It is then plentifully supplied by the country on both sides of the river, a constant communication being kept up between both banks by means of horse boats, by which the bulkiest articles can be conveyed to and from either side. But early in November, winter lays his embargo upon the southern shore; and but for the means to which I shall presently advert, the city would be left, until the end of April, for its supplies to the poorer district, on the northern side of the St Lawrence.

Intense and protracted as are the rigours of a Canadian winter, it is seldom that they succeed in arresting the voluminous current of the St Lawrence. The depth of the stream and the strength of the current are, generally speaking, more than a match for even a Canadian frost. The river freezes, on an average, about once only every five years; and when it does so, the joyful event is announced by the booming of cannon and by extra issues of the newspapers.

It must not be supposed, however, that when not frozen across, the St Lawrence is unencumbered with ice. For the long dreary winter it is so burdened with it, that navigation is entirely interrupted; and for days at a time, it is sometimes impossible, as you cast your eye over its broad surface, to catch even a glimpse of its dark leaden waters. Its channel then presents to you nothing but one vast, moving, solid white mass, which glides rapidly past the city, up or down, at the will of the tide. This is caused by the conglomeration of dif-

ferent masses of ice, of all sizes and shapes, some of which are detached from the shores of the river; but the bulk of which, proceeding from the great and lesser lakes of the upper country, sometimes so chokes up the channel of the river, as to give rise to the most calamitous consequences.

It is not always, however, that its surface is completely covered with these frozen masses. Sometimes they form the exception to the deep dark tide which bears them, when they look like ornaments of frosted silver on a basis of steel. They are of all sizes, from several hundred acres in extent to a few feet in circumference; whilst in appearance they are singularly fantastic, their surfaces presenting a succession of spires and pyramids, interspersed amongst huge frozen billows, piled in some places in fragments, like the masses blocked from a quarry—here presenting the regular outlines of the cone, there an irregular complication of form, which the fancy may shape into the most fantastic images—smooth and glassy in some places, broken and rugged in others—with here and there deep patches of snow, flanked with frozen masses resembling splintered rocks; and others, in shape like colossal boards, standing upon end. In the bright sunshine of a clear frosty day, they present, as you thread your way over their billowy surfaces, a singularly beautiful appearance—in some places reflecting the hues of the rainbow, and shining in others with a dazzling whiteness, here and there relieved by the deep-green lustre of the emerald.

Throughout the winter, a species of communication is kept up between the two sides of the river, which qualifies, to some extent, the assertion that all intercourse is then suspended between its opposite shores. By means of canoes, which are adroitly managed by *habitans*, as the French Canadians are frequently styled, passengers and lighter goods are constantly conveyed from side to side. But as this is a mode of conveyance not common to the experiences of Europe, a brief description of it will not be amiss in this place. If, therefore, the reader will accompany me, we will cross together from Point Levy to Quebec.

It is low water, and our first business is to scramble to the river's edge over the broken fragments of ice which have been deposited by the retreating tide upon the beach. The river is profusely covered with ice, which is floating rapidly down with the current. Its huge glittering masses seem to interpose an insuperable barrier between us and the city, part of which is nestled along the foot of the dark frowning rock opposite the rut, struggling up its different clefts and crowning its summit, the impervious battlements of the Citadel rising high and grimly over all. The town is fully a mile from us, but it does not look half that distance in the clear crisp air. Look which way you will, the scene around you has but one wild wintry aspect to present: far as the eye can reach on either hand, there is but one monotonous succession of ice and snow, relieved only here and there by the dusky forms of precipices, to which snow cannot adhere, and the brown leafless woods, from which it has been shaken by the wind. Nevertheless, the scene has excitements which partially atone for its intrinsic cheerlessness. There is a pleasure in breathing through your furs the pure keen air; the blood, thoroughly oxygenated, courses rapidly through the system, and you experience an exhilaration of spirits which harmonises with the cold brilliant sunshine which is streaming around you; for, cold though it may be, it is seldom that the wintry sky of Canada is darkened by a frown, retaining, amid the intensest rigours of the season, the deep lustrous blue which characterises its summer glow.

Here we are at last, ready to embark with our crew and fellow-passengers. The latter, like ourselves, are well clad in furs and 'overall's'—a necessary protection against the intense cold. The former are all attired in the gray *capote* of the Canadian, with its hood thrown down with a careful fold upon the back, and which,

their heads, the variegated sash around their waists, and the well-greased moccasins which protect their feet and legs, impart to them an appearance decidedly picturesque. Our craft seems rather frail for the accommodation of so many, and for a voyage apparently perilous. It is a large canoe, neatly excavated from a single log, and calculated at twelve persons' burden. With passengers and crew, we have our complement; so now for embarkation.

The canoe, which was lying on the ice, having been carefully launched, and passengers and crew having got aboard, we push off for the opposite side: but how to make it is the question, for, within pistol-shot a-head of us, an enormous field of ice is moving past with the current. To double this at any point appears hopeless, for we seem hemmed in on all sides by floating masses. The difficulty is soon solved, for we are no sooner alongside the impediment in question, than our crew are landed upon it, whereupon the passengers are politely requested to disembark. Then follows the most striking peculiarity of this novel species of navigation. After some manœuvring, we get the canoe high and dry again upon the ice. Here we are, then, upon a veritable floating island, which it is now our business to cross, and launch again upon the water at its opposite side. So off we set, dragging our canoe after us, which is no easy matter, considering the precariousness of our foothold, and the uneven and rugged surface of the ice. We have to make many a detour to avoid confused heaps of the frozen matter, piled and jammed together by the force of the current. All this time we are being borne rapidly down by the tide, and must make up our leeway on nearing the opposite bank. By and by we reach the water, launch, and embark again as before.

Our journey across, with some slight variations, consists of several repetitions of what is here described: now on the water, then on the ice; now afloat in our tiny bark, then dragging it after us, until another opportunity offers of rendering it serviceable. Here and there a pool of water, tranquillised by its confinement between two large sheets of ice, has frozen on the surface, forming a slender link connecting them together. When not very thick, it is broken by the weight of the canoe, which the stout *habitans* paddle lustily through it, crunching it before them. Sometimes, however, it is too strong, and defies their efforts, in which case the crew alone disembark upon it, and pull the canoe, with the passengers in it, over the glassy new-formed ice, which not unfrequently, whilst they are so engaged, breaks beneath their feet, when they are only prevented from sinking by the hold which they have upon the sides of the canoe. These successive interruptions render the passage exceedingly tedious, particularly when the river is much encumbered with ice; and the cold is sometimes so intense, that the drops which the boatmen throw off from their paddles fall frozen globules into the bottom of the canoe. One would be apt to suppose that so novel a species of navigation would be attended with peculiar hazards; and so it is. When the tide is ebbing, and the wind strong from the west, the adventurous voyager is sometimes driven far out of his course. I once left Point Levy for the city, and was landed, after drifting for three hours and a half upon the ice, on the island of Orleans, at a point about eight miles below the town. The stream was then so choked up, that it was seldom we could find an opportunity of launching our canoe; the intermediate spaces between the larger fields of ice being filled up with pieces too small for us to venture upon with safety. Cases have occurred, too, in which a canoe has been crushed to atoms between two sheets, the passengers only saving themselves by springing upon them, and drifting up and down until rescued from their perilous situation. On one occasion, when this happened to a canoe with nine persons in it, six of them sprang upon one piece of ice, and three on the other. They soon parted company:

who desried them; but the three were lost sight of, and drifted the whole night up and down with the tide. In the morning the wind was fresh, and the piece of ice which bore them was being gradually broken by the agitation of the water. At length it severed into two parts, one of the parties being left alone upon the smaller fragment. The two who were together seized an opportunity which offered, and sprang upon a larger field, and were saved; but no such opportunity offered to the other, who was never afterwards heard of. It is proper, however, to remark, that, dangerous as this adventurous navigation may appear to be, it is seldom that any very serious accident occurs.

The following incident may serve to convey some idea of the position of Quebec, and of the aspect which it presents to the view. The back of the old Government-House formed part of the ramparts of the upper town overlooking the St Lawrence. It was my lot to be making a winter passage of the river when the pile was on fire, as already alluded to. The sight was inconceivably grand. It was dusk, and the burning mass, situated at a height of about two hundred feet above the river, threw a lurid glare over ice and snow, rock, spire, and battlement. At length the roof gave way amid a pyramid of flame and sparks, which rose high into the air, whilst some of the blazing rafters, tumbling over the precipice, fell on the roofs of the lower town, built at the foot of the rock. Had this occurred in summer, the result might have been most disastrous; but the houses below were plentifully covered with snow, which soon extinguished the falling brands, and otherwise protected the roofs from very serious injury. In other places the rock is not quite so precipitous, but even there sufficiently so to keep the inhabitants of the lower town in constant apprehension of land-slips, one of which occasioned such calamitous consequences but a few years ago.

For a considerable portion of each successive winter, the mode described is the only one by which Quebec can communicate with the extensive agricultural district on the southern side of the St Lawrence. It not unfrequently happens, however, that the frost constructs a temporary 'bridge,' as it is called, by fairly manœuvring the river in ice, when the isolated city is once more put in easy communication with the chief source of its supplies. When this occurs, it is generally attributable to the jamming up into one compact mass, extending the whole way across the river, of the immense fields of vagrant ice afloat upon the surface, in the attempt to force their way through the straitened channel opposite the city. Immediately above the city, the St Lawrence swells into the proportions of a miniature lake, in width about three miles. About nine miles up, its channel is again contracted, where little more than a mile of water separates Cape Rouge, or Carouge, as it is commonly designated, from the opposite side. Beyond this, again, its dimensions once more expand to a breadth of several miles. In this upper basin, the floating ice sometimes accumulates in such quantities, that, in attempting to force the narrow channel at Carouge, it chokes up the river, and gets arrested in its progress, when, by the strength of the current, it is piled up into one huge, compact, and immovable mass, its rugged surface presenting throughout an aspect of the most confused and fantastic character. Here and there the mighty tide seems to have forced masses together, until, by attrition, they have almost ground each other to fragments; whilst in other places it is piled, heap upon heap, high into the air. But it frequently happens that the accumulation takes place in the basin immediately contiguous to the town, where the phenomenon resulting in the bridge occurs directly opposite. This is certainly preferable to having it nine miles up the river, and is a great event in the winter experiences of Quebec, not only as affording additional means of recreation and amusement, but as occasioning a decided fall in the price of all the necessary articles of domestic consumption. The bridge thus formed, however, is of little use

to the beleaguered city, until a practicable road is laid out and constructed over its stormy and rugged surface. Some years ago, a bridge of this kind was formed, which continued for several months, and became notorious for its peripatetic propensities. Having taken but little hold of the ice, with which either shore was constantly incrustated, the consequence was, that with the flow of each successive tide, it moved slowly and majestically for many miles up the river, returning punctually with the ebb to its former place, where it remained until the succeeding tide again enticed it away. This was more singular than convenient, the citizens having the use of their bridge but for half the day; and, in addition to occasioning frequent delays, sometimes gave rise to the most awkward mischances. One of the most ludicrous of these occurred but a few years ago. A marriage party set out from Point Levy for Quebec. A gay procession of sleighs descended the beach, and the bells were ringing merrily in the city opposite, where the ceremony was to be performed. The bride, all blushes, was seated in the first sleigh, which was driven by a distant kinsman. They had scarcely passed the open rent which intervened between the bridge and the stationary ice, when the huge erratic mass suddenly started from its anchorage, and moved slowly up the stream. The astonished bridegroom, who was in the next vehicle, vainly endeavoured to urge his horse to spring upon the moving mass; the sagacious animal started back, enorting and affrighted. The bridegroom then sprang from the sleigh, and endeavoured to jump after the runaways; but he was too late, for more than six feet of deep, cold, leaden-looking water now intervened between him and his truant bride, and they stood gazing upon each other with looks of mingled astonishment and alarm. They had miscalculated their time; and the bridegroom realised that day, in his own experience, the truth of the maxim, that time and tide wait for no man. When the power of utterance was restored to him, he informed his beloved that he would wait there for her until she returned, all hopes of having the ceremony performed that day being at an end. But his troubles were not yet over: his fair one was as fickle as the ice, and her heart soon became, to him, every bit as cold. In her romantic voyage she was alone with her kinsman, already alluded to; and being thus thrown so singularly together, she was soon persuaded that there was no reason why they should ever separate. They accordingly made their way across to the other side of the wandering iceberg, and about six hours afterwards, when it had returned to its moorings, stepped from it into the city, whence they immediately started for Montreal, where they were married. Since that hour, the forsaken bridegroom has never ventured upon the ice without being reminded of how many a slip there is between the cup and the lip.

Great is the rejoicing in the city and in the country round when, instead of this rugged and chaotic bridge, the frost lays the current by the heels, and the river becomes fairly frozen across. To accomplish this, however, requires his mightiest efforts; and it is only, as already intimated, about once in five years that he is equal to the task. It was my good fortune to witness the magnificent result of a successful effort. To attain success, it is necessary to surprise the current in its weaker moments, about the turn of the tide, before the ebb commences, especially when it is high-water early in the morning, when the wind is lulled, and the cold is most intense. It requires as much adroitness thus to arrest the St Lawrence, as it does to catch the wild horse on the prairie. No sooner was it known, on the occasion referred to, that the river had 'taken,' than the population of Quebec poured down upon the wharfs to assure themselves of the fact. Much anxiety was expressed lest the new-formed ice should give way, ere it had attained sufficient firmness to resist the impetuosity of the current at its strongest point. The only class of the population to which its formation gave umbrage, was that which subsisted by ferrying passengers across

in canoes, a business with which the bridge would necessarily interfere. The canoe men were therefore busy at an early hour crossing and recrossing, and forcing their canoes in zig-zag lines, from side to side, through the yet thin ice, in the hope of inducing it to move away. A proclamation issued from the executive government warning them to desist; but continuing their selfish work on the Point Levy side, it was only when a gun had thundered at them from the Citadel, that they left the frost to do its work.

The ice had first formed about five in the morning, and by ten o'clock several sleighs had ventured across it. By mid-day, they were to be seen gliding over its glassy surface in all directions, and whilst it yet bent elastically under them, like an extended carpet waving to the wind. In the afternoon things wore a jubilee aspect on the surface of the captive river. The city seemed literally to have emptied itself upon the ice. Thousands of pedestrians promenaded, as they best could, over its slippery surface; whilst multitudes of skaters, of all ages, and of both sexes—and a graceful thing it is to see a lady skate well—flew about in all directions, as if, like Mercury, they had a pair of wings at their heels. Sleighs innumerable, from the ice-incrusted sledge of the waterman, to carriages of the finest finish, and others of the most fantastic form, dashed about on all sides—the devices of the buffalo robes, the trappings of the horses, and the myriad little bells which dangled from the harness, and jingled merrily in the clear keen air, imparting additional vivacity and gaiety to the scene. But the feature in the picture most novel to the stranger was the ice-boat, which, with its overloaded cargo of jovial holiday-makers, flitted swiftly by with extended canvas, like a powerful bird upon the wing. In all parts of Canada, the ice-boat is a favourite source of winter amusement. It is easily constructed, being mounted upon three skates, or small runners in the form of skates; two of which are in front and abreast, the third being behind, attached to the rudder, the purposes of which, indeed, it serves. A mast is then erected, together with such rigging as is necessary to support the sails; and thus equipped, they are capable, with a good wind, of performing long journeys in a very short space of time. They are frequently of the rudest form, at other times elegantly constructed; and sometimes consist of an actual boat, mounted upon a frame already fixed upon runners. The speed with which they fly before the wind is almost incredible, whilst it is dangerous, unless they are properly steered. Nor are they deficient in powers of tacking, for, when rightly managed, they beat well against the wind. To be aboard one of them affords the most exhilarating sport. I was engaged to dine one day with a gentleman at Etcham, about nine miles up, on the opposite side of the river; I was conveyed thither in twenty minutes by an ice-boat, and returned in the moonlight upon skates.

The ice affording excellent opportunity for artillery practice, the citizens are frequently, during the winter, treated to a spectacle of this nature. The track of the solid shot can then easily be traced by the eye; for, on every plunge which it makes on the now solid ice, it throws it up in a cloud of shivered fragments in the air.

The Quebeckians are fond of winter excursions to the environs of their city, which they frequently make in large parties; sometimes as many as a couple of dozen of sleighs, on such occasions, trotting merrily off together, either for Lorette, where the remnant of the Huron tribe of Indians have been settled by the government; or to the Fall of Montmorency, about ten miles down the northern bank of the river. At the latter place, an enormous cone of ice is formed by the spray, which rises gradually as winter advances, until at length it almost hides the cataract from view. When a bridge is formed, the points to which these excursions are made are of course multiplied, whilst the gaiety of the town is increased by the appearance within the

walls of 'country cousins' from the opposite side, to whom it was previously virtually forbidden.

Indeed winter is the season for gaiety in this ancient capital of the province. In summer, people are too busy for amusement; in winter, they are all idle, and think of nothing else. In the afternoon of a winter day, St John Street, the chief promenade of the upper town, is crowded with vehicles and pedestrians, presenting a picture of the most gay and lively description. Pedestrianism, by the by, is not always an easy matter in Quebec; the difficulty of keeping one's legs when the snow is beaten hard, in streets which lie at an angle of forty-five degrees, being sometimes great. To insure safety, many attach small spikes to their boots, removable at pleasure, as women in England put on pattens when it rains, to lift them out of the mud.

The snow which falls in Lower Canada attains each winter the average depth of five feet. But it is not allowed to accumulate in the streets of the city, each householder being obliged by law to prevent it from attaining, in front of his own premises, a greater depth than is necessary for sleighing purposes. What is left becomes beaten as hard as ice, resisting the action of the returning sun until the month of May, by the seventh day of which another municipal ordinance requires its removal. It has then to be literally hacked to pieces with axes, and carried away in sledges.

Cold as a Quebec winter undoubtedly is, there is an exaggerated notion abroad in this country respecting it. It is true that meat freezes so hard, that it has to be sawn like bone—that milk is sold in solid masses by the pound—that the carcasses of slaughtered sheep and hogs stand rigid and upright in the market places—that men are sometimes bedizened with pendant icicles from hair and whiskers, looking like ladies in their curl-papers—and that noses sometimes become frozen so hard, that it would be dangerous to pull them lest they should break off—but after all, notwithstanding these admitted horrors, a Quebec winter is not so very intolerable a thing. True it is, that whilst riding, it is always necessary to be well clad in furs and skins; but it is only at long intervals that the cold becomes so intense as to render extraordinary precautions of this kind necessary in walking. An old-country man endures the first winter better than any subsequent one; a six months' subjection to stove heat, in close rooms, with double windows to keep out the frost, followed by the intense heats of summer, so modifies his constitution, that his sensitiveness to cold increases. The worst feature of a Canadian winter is its protraction. Long before its close, the eye wearies for the sight of something green, which, when spring does come at last, clothes the landscape almost in a day. The citizens, too, are weary of their idleness; and it is with a delight which scarcely knows bounds, that, when the grass has once more taken possession of the fields, and the ice is fast forsaking the river, they rush down in crowds to the long-deserted wharfs, to hail with their shouts, and feast their eyes upon, the 'first ship from Europe.'

THE ONE-EYED WIDOW AND THE SCHOOLMASTER.

'He's an old savage that vile Monsieur Pascal Camus: he would do anything to destroy my peace.'

'She's an old one-eyed vixen that Madame Marengo: nothing makes her so happy as to find means of annoying me. I know she wishes to put me in my grave; but I scorn and pity her.'

Such was the nature of the criminations daily uttered by two parties in regard to each other—the one an aged schoolmaster, and the other the widow of a sergeant, both of whom lived in the same tenement in one of the back streets of Paris. Let us introduce them to the reader. Madame Marengo was a tall masculine sort of woman who had seen service. She had for years followed the *Grand Army* during Napoleon's wars, in which she had first lost an eye, and then lost her husband, a

gallant sergeant, who had assumed the name of Marengo, in honour of the battle in which he had been promoted from the ranks. For her long and faithful services in attending on the wounded at the different engagements, as well as for the deprivation of her husband, Bonaparte had presented her with a cross of the legion of honour, which she greatly prized, and constantly wore suspended from her neck. Now somewhat broken down, but still animated with much of the old fire, she subsisted by carding and renovating wool mattresses—a great trade among the humbler classes in Paris. She did not derive much from her occupation of *cardeuse*, as it is called; but this little, joined to the trifling pension which accompanied her 'cross,' was enough for all her wants in her lofty and solitary attic.

M. Pascal Camus, who lived on the ground-floor, where he conducted a small school, was equally a curiosity in his way. While the *cardeuse* was tall and bony, and a little rough in manner, the schoolmaster was short, dumpy, and pompous; while she was all for the Empire, and considered Napoleon to have been the greatest of earthly beings, he was fixed in his admiration of the Bourbons, detested Napoleon, and called him a usurper and a tyrant. There were here sufficient elements of discord; but more were not wanting. M. Camus hated the *cardeuse*, because she wore a cross of the legion of honour. The *cardeuse* hated M. Camus, because he persisted in wearing a queue and shoe-buckles—undeniable tokens of regard for the old régime. Differing in sentiment on so many things, these two personages had at least one point in common—they had respectively a very great notion of their own importance. Madame Marengo could never forget what she had seen and gone through. M. Pascal Camus secretly believed himself to be a genius. It is true that his genius had not been acknowledged by the world, but he rather liked that: great geniuses had all been unknown at some time or other; and even should his genius never be acknowledged during his lifetime, there was no small pleasure in reflecting how society would afterwards lament for not having encouraged and rewarded his merits. It was quite a feast to think how mankind would some day be sorry for having neglected him, and wish to do him honour when it was too late. 'Perhaps,' thought he—for the poor man was a widower—'my little daughter Annette may one day come in for a share of what can no longer benefit me.'

Every one who thought anything of the subject, observed that no two persons could be more opposite in their notions than the *cardeuse* and the schoolmaster; but nobody could understand why they should live on such terms of hostility. They did not necessarily require to interfere with each other; though dwelling under the same roof, six floors separated them, and they did not even need to know each other. Why, then, did they quarrel so frequently? Why utter such terrible things of each other to their neighbours? The truth is, the good people who lived in the vicinity of the belligerents did not exactly comprehend their character. Both were, in reality, not ill-disposed; under an external eccentricity, each had a kindly heart. They, however, equally required a certain homage, which, if granted, all well and good; but if denied, then there was nothing but mischief. With two such persons a collision was inevitable. It is impossible to say on what occasion a mutual huff was created: but a disagreement once having taken place, the bristles of both were up; and soon was proclaimed an everlasting and mutual war. Henceforth they exchanged scowling glances when they met on the staircase, and the mutual hatred was intense.

Did this blow-up render the two unhappy? No such thing. They were of course kept on the fret; but somehow this was what they liked. It was meat and drink to them to have somebody to be at war with—somebody who, they imagined, was constantly persecuting them. They, in fact, required to live in one of two conditions of feeling; that is, either to feel that they were

worshipped or hated. All who paid them any sort of respect, were the most amiable people possible; all who gave them any real or imaginary cause of offence, were demons. Having settled down in this voluntarily-embraced enmity towards each other, their tongues, on all suitable occasions, told of sufferings. Madame Marengo averred that M. Camus, whom she called an 'old savage,' an 'old Cossack,' and fifty other bad names, had no other earthly purpose in living but that of tormenting her. Some charitable persons wanted to persuade her that the good man might wish to live for his own sake, or perhaps for that of his little daughter Annette; but Madame Marengo only smiled incredulously: she knew better than that. It was a remarkable proof of the sympathy which will sometimes exist even between inveterate foes, that M. Camus was precisely of a similar opinion. He affected, however, to look upon Madame Marengo with calm contempt, and a certain degree of the heroic resignation which is generally found to characterise lofty spirits. It was not the *cardeuse*, he declared, who acted, but a hidden and mysterious power within her. He forgave her, for he knew she was not a free agent, but merely the instrument of that fatality which delights in persecuting genius. When people advised him to leave the house, he seemed to compassionate their ignorance, and informed them that Madame Marengo would follow him wherever he went; that he did not, however, blame her for this: she could not help herself. And he generally closed his remarks with a quotation from Corneille or Racine, in which the *cardeuse* was successively compared to Athalia, Agrippina, and Berenice, to all which poetical characters the one-eyed widow evidently bore a striking resemblance.

Thus it will be seen that the enmity of the *cardeuse* and the schoolmaster was rather a pleasant kind of affair after all. It was something to think of; and whenever they were afflicted with any little misfortune, they had the comfort of knowing that it must come from the enemy's quarter. Of course it never signified whether there was proof that such was the case or not; M. Camus and Madame Marengo left proofs to the vulgar.

The parties were in the full enjoyment of their hatred, when a young working-man, named Paul Simoneau, about seventeen years of age, came to lodge in the house, and took one of the attics on the same landing with Madame Marengo. He was one of those joyous contented-looking beings whose constant good-humour secures them universal good-will. The world, after all, is generally disposed to be friendly with those who seem to be at peace with their own hearts. Though Paul was without relations or near friends, and though he earned but little in comparison with his wants, he was not merely resigned to his fate, like so many people, but perfectly satisfied with it, which was perhaps better still, and certainly more pleasant to himself. He soon became a great favourite with Madame Marengo. She had resolved at first to be exceedingly reserved; not approving of intimacies between neighbours, as such affairs—witness herself and M. Camus—never ended well. But this philosophy would not do when applied to Paul. In the first place, he had one of those clear pleasant voices which are perfectly irresistible; so at least thought the sergeant's widow, when she heard him singing in the morning some popular strain of Béranger's, almost always referring to the *Grande Armée*, or to her darling Emperor. Then, in spite of herself, her heart yearned towards him; for he reminded her of her youth, and of a son about his own age, whom she had lost many years ago, and who sang the very same songs. Listening to him thus morning after morning, the *cardeuse* could not help occasionally opening the door of her room, and thrusting out her head just to give him a good-humoured nod as he went out to his work. Paul answered by taking off his cloth cap, and politely inquiring after her health. With all her roughness, Madame Marengo was a rigid formalist. She would have felt highly indignant had a man, no matter of

what degree, addressed her with his hat on; and she was the more exacting of such homage, that she knew it was no longer paid to her personal attractions, but to her sex and military service. When Paul, therefore, stood before her with his cap in his hand, the good dame, smiling on him with gratified pride, could not but inquire if there was anything she might do for him? Should she give a look to his room, or feed his bird whilst he was out, or do any little thing of the kind? Paul generally accepted of her kind services; for he saw that Madame Marengo was never happier than when she had made his little room quite neat, sewed a loose button on his coat; or rendered him any other trifling service. In this manner, from mere acquaintances, they soon became friends. She loved the young working-man for his never-failing good-humour, which seemed to her to gladden the whole of the gloomy house for the few hours he spent in it; and he liked the cardeuse for her quaint sayings, old stories of long-fought battles, and the genuine kindness which, notwithstanding her outward roughness, still lived at her heart.

It happened that M. Pascal Camus, who was, however, far more exclusive than even Madame Marengo, was, like her, unaccountably mollified by the cheerfulness and good-temper of Paul Simoneau. It was this worthy gentleman's habit, when his pupils had retired for the evening, to sit on a chair near the threshold of his school-room, and thence mark attentively who went up or came down the stairs. The portress, whose office he thus usurped, was highly indignant at his presumption, which she ascribed to overweening curiosity; but M. Pascal Camus, like all true philosophers, delighted to observe human nature, and he declared that he had learned more by sitting at his door, with his little Annette working by his side, than from the reading of heavy folios.

It was thus he first saw Paul Simoneau coming home from his work in the evening, with his bag of tools thrown on his shoulder, and ascending the steep staircase that led to his attic, with a step so free and elastic, that M. Camus, who averred he knew a man's temper from his tread, instantly saw that Paul was perfectly happy. The young man did not fail, on his part, to notice the schoolmaster's quaint and stumpy figure; but seeing him, evening after evening, in the same attitude—for either summer or winter, M. Camus was at his post—he began to think that he could not pass by him without some token of recognition. Not wishing, however, to make too free—there being nothing particularly inviting in M. Camus's solemn visage—he merely bowed as he passed the door of the school-room. Here was a proper concession. The schoolmaster acknowledged his bow by a condescending nod; but though it would not have looked dignified to be pleased, he was, to say the truth, exceedingly gratified. There must be something truly delightful in natural courtesy, for it seldom fails to conciliate: the most rugged and stern are softened by it, because they feel that it is not a mere empty form; they see that it comes from the heart.

M. Pascal Camus, though a wise and learned man, was not above being pleased with the deference of those whom he considered his inferiors. Paul's bow showed the secret but respectful admiration which he felt for his—M. Camus's—character; his not venturing on any undue familiarity, also spoke in his favour; in short, the schoolmaster was so well pleased with the young working-man, that his nod became more condescending every evening, until he at last, one day, actually asked him to walk in. This interview so heightened his good opinion of Paul, that he frequently renewed his invitation; and the young man, who found the schoolmaster's conversation improving, though somewhat pedantic, neglected no opportunity of being in his company. It was not long before Madame Marengo discovered that Paul Simoneau was on friendly terms with her enemy; she was indignant at the schoolmaster's impertinence in presuming to entice away a person in whom

she felt an interest, for she would never admit that M. Camus might love Paul for his own sake: everything was done to vex and annoy her. M. Camus entertained a similar opinion: 'if Madame Marengo paid the young man any little attentions, it was because she knew that this was offensive to him.' But they both agreed that such conduct was too contemptible to be worthy of the least attention, and determined to dis-appoint the enemy by taking no notice of this treacherous attack. Thus the two antagonists exulted in their imaginary triumph over each other, admiring their own wisdom, and pitying the blindness of their foe.

This dream, so soothing to the pride of the two antagonists, was unfortunately disturbed by Paul Simoneau: he did not, or would not, understand that their enmity was for them a very pleasant and comfortable feeling; and he actually took great pains to destroy it. In the first place, he completely undeceived them as to the belief each had so long entertained—that the other was always engaged in some dark plot against his or her welfare. He proved to M. Camus that Madame Marengo thought much more about her mattresses than about him; whilst he clearly showed her that she was of very secondary importance in the schoolmaster's opinion, by assuring her, when she wanted to know all the bitter things he had been saying of her, that M. Camus had not uttered her name to him for the last week. Of course madame could not believe this; it was said to spare her feelings: but Paul need not fear; she was accustomed to the 'old Cossack's' hatred, &c. When Paul, however, assured her this was actually the case, she felt exceedingly disappointed, and haughtily wondered whether M. Camus meant to insult her by such behaviour? M. Camus felt himself equally aggrieved on learning from the young man that he was not the first object of Madame Marengo's thoughts. The two enemies now began to discover that the charm of their hatred was rapidly vanishing away; and as this was evidently Paul's doing, they would have quarrelled with him had the thing been possible. But he looked so unconscious of harm, and seemed so pleased when he had been saying something likely to reconcile them!

Matters went on thus for some time, until gradually, and in spite of themselves, the feelings of the two antagonists began to mollify. Paul had the art—if that could be called art which was so natural to him—of setting things in their most pleasant and kindly aspect. There was not a good trait in the character of Madame Marengo which he did not repeat to M. Camus, and *vice versa*. This did not produce a very strong effect on the schoolmaster, whose heart was somewhat tough; but Madame Marengo's was of softer texture. Being what is termed a woman of strong affections, she could not remain in a state of indifference. Her hatred for the schoolmaster was fast melting away! evidently it would be replaced by a better feeling. All at once she began to discover that M. Camus was a remarkable man, and profoundly learned; then his daughter Annette was such a nice, pretty girl! in short, there were so many reasons for liking him upon the whole! One morning, when she was thus favourably disposed, the cardeuse chanced to perceive M. Pascal Camus standing at the door of his school-room: he looked so majestic, that her heart was touched; she could not resist the temptation of calling up an amiable smile on her weather-beaten features, gently nodding to him as she passed by. At first M. Camus was so much astonished, that, as he afterwards observed, he remained rooted to the spot; but as he knew nothing of Madame Marengo's favourable feelings, and considered her courtesy an audacious insult, he soon rallied, and eyeing the smiling cardeuse with a glance of unutterable scorn, he turned his back upon her with haughty contempt.

Madame Marengo was highly indignant to find her advances repulsed; her hatred now returned tenfold; and as she was going to work the very same day for a dyer's wife who lived next door, she did not neglect this opportunity of venting her spleen on M. Camus,

by giving him every fault which a human being could possibly possess. On the evening of the next day, when Paul began speaking to her of M. Camus, the cardeuse immediately declared she would hear nothing about him.

'Ah, madame,' deprecatingly observed Paul, 'he is so unhappy just now. You know that he has not many scholars. Well, the dyer's wife, who lives next door, had promised to send her little nephew to his school; he was to get fifteen francs a-month with him, and it would have just paid his next quarter's rent. If you were to know how glad he and Annette were about it—for though she is only thirteen, he tells her everything. As they were telling me of it this evening, the dyer's wife came in, and taking Monsieur Camus into the other room, told him that she could not think of sending her nephew to his school, as he was known to be such a shocking bad character; that she had good authority for what she said; but not liking to make mischief, would not name the person from whom she had learned this. She spoke so loud, that Annette and I could hear every word: poor Annette cried all the time. When the dyer's wife was gone—and she did not stay long—Monsieur Camus came out, looking so sad, that it made my heart ache. Poor man, he was thinking about his rent, and wondering what he should do!'

Every word that Paul uttered smote Madame Marengo to the heart. Instantly she underwent a revolution of feeling. Her hatred turned to compassion. She was evidently the cause of all this mischief, and bitterly did she repent ever having uttered a word against the schoolmaster. Whilst Paul remained with her, Madame Marengo laid her feelings under some restraint, but as soon as she was alone, she began wondering how she could repair the injury she had inflicted on M. Camus. This seemed difficult enough; but though hopeless of success, she resolved to speak to the dyer's wife the next morning. As she had expected, she failed; the boy had already been sent to another school; the dyer's wife was, besides, one of those persons who make it a rule never to retract a resolution, howsoever absurd or erroneous it may be. Madame Marengo came home with a heavy heart. What was she to do? To throw herself on the tender mercies of M. Camus, and tell him all! But besides that, the cardeuse wanted sufficient magnanimity for this, she knew that it would not restore the lost scholar. After mature deliberation, she at length resolved to make another effort to get reconciled to the schoolmaster, hoping to be able to render him some service, which might compensate for the harm of which she was the cause. The very same day Paul was charged to bear proposals of peace to M. Pascal Camus from Madame Marengo. In his present humbled condition, M. Camus found this exceedingly gratifying.

'You see, Paul,' he observed with calm dignity, 'the moral power of genius. I have at length compelled Madame Marengo to acknowledge, as she was bound to do, my superiority. I cannot, however, grant her request without certain restrictions. She has braved me too long for this, and it would not do to let people think they have only to ask my forgiveness in order to obtain it.'

Accordingly, M. Camus clogged his consent by so many vexatious and haughty clauses, that Paul declared Madame Marengo would never submit to them. 'I don't care, sir,' replied the inflexible schoolmaster: 'I did not make any friendly proposals to Madame Marengo; if she will not agree to the terms I offer, it is perfectly indifferent to me. But she will agree to them, depend upon it,' he added with a complacent smile; 'I saw it in her eye the last time she attempted to insult me: that woman's spirit is conquered, sir.'

Though Paul somewhat doubted this assertion, he mentioned to Madame Marengo the conditions on which the schoolmaster had agreed to receive her into his favour. To his great surprise, she agreed to every-

thing. But M. Camus was not astonished; he had predicted that it would be so. When it was understood in the house that Madame Marengo and M. Pascal Camus were on good terms, the news was heard with that suspicious astonishment which might have been felt of yore if peace had been proclaimed between Rome and Carthage. The portress declared, for her part, that it was only a hollow truce, and most of the lodgers shared in this belief. Matters went on, however, much better than these charitable individuals had anticipated. M. Pascal Camus was all condescending kindness, and Madame Marengo much more submissive and respectful than could have been anticipated; but the truth was, that her soul was burdened with remorse, and she longed to repair the mischief she had occasioned by rendering her former enemy some signal service. M. Camus, however, would give her no opportunity of doing this; he was so exceedingly dignified, so reserved, and placed so many impediments in her way, that Madame Marengo fretted and fumed in the excess of her impatience. 'This only increased,' as the schoolmaster expressed it, 'the strong necessity which existed for him to keep Madame Marengo at a proper distance. For you see, my dear sir,' he would observe to Paul—he was always wonderfully polite—'it would never do to allow such people to be familiar with me, merely because they happen to be a little good-natured, and all that. Madame Marengo has good points, I allow; but I must confess, that to me she always smells of the barracks.'

Matters had gone on thus for about a month, during which Madame Marengo had more than once been strongly tempted to quarrel with M. Camus for not allowing her to serve him in some way or other, when, luckily for her, but, as it proved, rather unfortunately for him, she found an opportunity of displaying her zeal. The schoolmaster fell dangerously ill; and as the doctor declared that he had a contagious fever, the school was deserted in no time. Annette attended on her father with the greatest devotedness, but in a few days she was laid up with the same disease. Now was the time for Madame Marengo to show her friendship. Paul was very willing to do everything in his power for the poor schoolmaster; but the cardeuse declared that he was only in the way, and so managed, that the whole burden of waiting on M. Camus and his daughter soon rested on herself. She did everything; cleaned the rooms, prepared the necessary *tisanes*, attended on the two patients with unwearied zeal, paid the rent and the doctor without saying anything about it; in short, she would even have given the lessons to the pupils, if they had not been all gone away. And her zeal was so exemplary, that every one admired it, excepting the portress, who declared, with a wink, that she was as knowing as Madame Marengo, and could see through her arts; which meant that the cardeuse entertained matrimonial designs on M. Camus. If such was indeed the case, Madame Marengo's expectations did not seem likely to be realised, for though Annette was soon out of danger, her father grew worse every day. His mind, however, was perfectly sound; and it is only just to say, that if his heart had long been obdurate, it now seemed to be entirely softened in favour of his kind nurse. Though Madame Marengo had lived amongst soldiers, and in barracks, and though her manners were not irreproachably genteel, she had a true and honest heart; and with all her outward roughness, none knew better than she did how to render a service in a delicate manner. The schoolmaster saw all this, and he now wondered why or how he had ever hated Madame Marengo.

One evening when the schoolmaster was revolving those thoughts in his mind, he suddenly turned towards the cardeuse, who was sitting at the head of his bed, and earnestly observed, 'Madame, if I die, I think I can intrust Annette to your care. I know,' he added, with a patronising air, which even now he could not quite cast away, 'that I might confide her to a more

educated and accomplished lady, but I doubt whether I could find one with a kinder heart.'

M. Pascal Camus spoke this in the tone of a man who confers a great favour; and though, after his death, Annette would be a portionless orphan, it did not occur to him to look on the matter in any other light. It will perhaps be saying more in Madame Marengo's praise than we might otherwise express, to state that she took precisely the same view of the subject. She only saw the moral trust reposed in her, and she was deeply affected. It was the first time, too, that the schoolmaster had ever addressed to her a word of praise: the tears rose to her eyes, and in the height of her emotion she begged M. Camus to forgive her all that she had ever done against him. Then she confessed to him that she had been the cause of his losing his pupil, and that numbers upon numbers of times she had called him, behind his back, 'an old Coassack.' This irreverent appellation rather shocked M. Camus; but he made a heroic effort, and as Madame Marengo was evidently deeply penitent, he declared that he forgave her. It was his duty, he said, as a Christian, for he felt his end approaching. Madame Marengo assured him that he was much better, but M. Pascal Camus persisted that he was dying. 'All men of genius,' said he solemnly, 'foretell the hour of their death: it is not therefore astonishing that I should be able to predict mine. I shall die,' added he, after a moment's pause, 'at seventy seconds past eight o'clock to-morrow morning. Mind, Madame Marengo, at seventy seconds past eight!'

'Well, do drink some of your tisane; there's a dear,' interposed Madame Marengo, rather alarmed at the sick man's excited look. M. Camus was the most docile of patients; he took the drink, and as it was of a soporific quality, he soon sank into a deep sleep. Madame Marengo was not very superstitious, but she had heard of such things as deathbed predictions, and she had strong faith in her own presentiments. Now she happened to feel a particular presentiment, which told her that M. Camus would really die at the appointed hour—great, therefore, was her anxiety during the night. M. Camus never wakened once: this looked extremely suspicious: morning came, and still the patient slept: eight o'clock struck, and Madame Marengo's heart beat high: she watched M. Camus with feverish anxiety: the seventy seconds passed, and still he did not waken: in short, M. Camus did not open his eyes until a quarter past ten. Though rather pleased to find himself alive and well, he was exceedingly surprised: there must be some mistake: the clock did not go right: this was the first prediction of his which had not proved correct. At this moment the doctor came in. He declared that the patient was much better; a favourable crisis had occurred during the night. M. Camus immediately brightened up: this explained everything: he was to have died at seventy seconds past eight, but a favourable crisis having occurred, the consequence was, &c. &c. Madame Marengo's presentiment admitted of a similar explanation, and both were perfectly satisfied.

M. Camus now recovered rapidly. In less than a month, he no longer needed Madame Marengo's assistance, and was able to attend to his pupils. He then discovered that they had all left him. Their parents declared, much in the same language which he had once applied to Madame Marengo, that both himself and his school-room smelt of the fever. This was a sad blow for the schoolmaster; but it happened that, at that very time, Paul ascertained that the savings' bank, in which he had deposited a few hundred francs, saved from his earnings, was a remarkably unsafe place for money. He immediately expressed a wish to invest it in some safe speculation. In short, though not without much pressing, Paul induced M. Camus to accept of a loan, part of which was to be applied to his immediate wants, whilst with the rest the school-room was to be fitted up in style. This produced a wonderful effect: pupils immediately

flocked in, the dyer's nephew among the rest; and in less than a year, M. Camus was able not only to return Paul's loan, but even to repay Madame Marengo the sums she had spent upon him during his illness.

Several years have passed away since the reconciliation of M. Pascal Camus and Madame Marengo. They have wisely abjured speaking on politics, and are now as staunch friends as they were formerly bitter enemies. They have learned, that though people may not agree on certain points, still there is no reason why they should be enemies. Though Paul was the instrument of their reconciliation, both the cardeuse and the schoolmaster declare that their friendship is simply owing to the excellent qualities which they have since then discovered in each other—qualities of which they could of course know nothing as long as they remained mutually hostile. It will serve to show the confidence which reigns between them to state, that they have lately agreed, but in secret, that a marriage between Paul and Annette would be a very eligible affair in a few years' time. But as both the parties are yet rather young, the elder ones have wisely determined, though they have long marked their secret attachment, to say nothing on the subject yet; and indeed it was premature to mention it even here.

There are a great many Madame Marengos and Monsieur Pascal Camuses in this world, who quarrel half their lives without knowing why. What a pity they will not try the other system, by way of change! They would find it much less troublesome, and ten times as pleasant, after all.

THE BLACKBIRD.

'I could not think so plain a bird
Could sing so fine a song.'

SOME birds, it is generally admitted, are among the most interesting portions of the animal creation, affording a copious and instructive study to the naturalist, and delighting the mere lover of nature with their matchless music, which adds a vocal charm to sylvan scenery. Among the warblers for which this country is celebrated, the blackbird is esteemed a universal favourite. The jetty songster may often be seen in the rural districts, whistling merrily in his wicker-cage suspended on a cottage wall, or the branch of a tree overhanging the garden path. Occasionally, too, his shrill and gladsome note may be heard ringing in the noisy streets of large and busy towns, imparting a touch of nature, and reminding the passer-by, who has a heart to feel, of the green country, its pleasant lanes, sunny fields, and shady woods.

The blackbird is a native of England, staying with us the whole year, and is the largest and earliest of our messengers of spring. It is the first of the seven tribes which constitute the *turdus* or thrush genus, and is found all over Europe, but appears to be less constant in Holland than in other places; in that country, though numerous in the autumn months, it is rare in winter. Blackbirds are found also in Northern Asia, as far down as Syria: a large portion of the earth's surface is thus enlivened by their song. In England, they commonly begin to sing in February: while the ground is covered with snow, before a leaf is to be seen, or other birds have commenced their warblings, they pour out their clear notes from some thick hedgerow or the corner of a wood.

Blackbirds couple early soon after beginning to sing, and lay twice in the season—the first time about the end of March; but this brood is seldom reared, owing to the general inclemency of the season, and the want of shelter. The first laying—five or six eggs—is always more numerous than the second; a fact noticed long ago by Aristotle, and verified by later observers. The birds are said to be shy and suspicious: the place, however, in which they build appears to be chosen without regard to concealment; for they often select bushes and low trees in gardens, or hedgerows by the side of much-

frequented walks. The nest is made of rushes, twigs, or coarse grass, cemented together with clay, and lined with wool, hay, or hair. According to some naturalists, the birds render the clay walls of their nest more secure by mixing in hogs' bristles, and leave a hole in the bottom for the escape of water, which, if April be showery, would fill the interior, and destroy the eggs. Sometimes, as if for greater stability, the materials of the nest will be made to embrace a branch of the bush in which it is built; the structure is, however, very rudely finished, and exhibits none of that neatness displayed by many smaller birds. The colour of the eggs is a bluish-green, clouded with deeper shades of the same hue, and dusky patches and veins.

In some parts of the country, particularly the north, the blackbird is still called the *merle*, from its Latin name *merula*. Scott tells us, in one of his spirited ballads—

'Tis good, 'tis good, in gay green wood,
When mavis and merle are singing.'

The bird's habit of flying *mera*, or solitary, is said by Varro to have gained it this appellation. The merle appears to have been a favourite among our older poets: Chaucer and Spenser make frequent mention of his musical name. He was also known as the *ousel*. Drayton uses both expressions—

'The ousel near at hand, that hath a golden bill,
As nature him had marked of purpose, 'let us see
That from all other birds his tunes should different be:
For with their vocal sounds they sing to pleasant May;
Upon his dulcet pipe the merle doth only play.'

Shakespeare, too, sings of

'The woodcock, so black of hue,
With orange-tawny bill.'

The blackbird, according to Buffon, is of a more decided black than the raven, its plumage being less affected by reflection. The bill of the young does not acquire the yellow tinge until they are a year old; the inside of the mouth, the heel, and soles of the feet, then become of the same colour, and a beautiful circle of gold forms round the eyes. The female is not so dark as the male, her feathers incline to a rusty black or brownish hue. During the period of incubation, the male will frequently sit on the eggs for four or five hours, while his mate

— 'Sudden flits
To pick the scanty meal.'

The sight of these birds is very acute, which enables them to detect an enemy from a great distance; their reputed shyness may probably arise from this cause, and their taking to flight on the first alarm. It is, however, certain, that if much watched or disturbed, they will abandon their nests, and on such occasions are said to break their eggs, or destroy the young.

Although the low position in which blackbirds generally place their nests exposes them to many casualties, they are slow to learn from experience. Gesner, however, relates an instance of two young broods having been eaten by a cat from a nest built at the foot of a hedge. After the second loss, the parent birds abandoned the old nest, and constructed another in an apple-tree, at a height of eight feet above the ground, out of reach of the enemy. On some occasions blackbirds seem to forget their habitual mistrust, and invite observation. A pair once built their nest among some dry thorns in a pile of fagots in a garden near Windsor, close to which men were passing the whole day with wheelbarrows. The nest was so near the ground as to be completely exposed to view, but the birds persevered and reared their young. Another pair built, a few years ago, in the camellia-house of the Messrs Lodges of Hackney, where the female was frequently seen sitting on the nest by the numerous visitors to the celebrated nursery. An instance is recorded among others, in Stanley's 'Birds,' of a blackbird's nest on the ground, in a tuft of grass or rushes, close to the

seat of a rabbit—the tail, in fact, of the rabbit being in contact with the nest. As the seat as well as the nest were both occupied, these two companions must have sat meditating together for many a day in perfect peace and good fellowship.

The old birds separate as soon as their offspring are able to live without aid, and never come together again until the next breeding time. Although attentive to their young, they take but little care of themselves, and in the winter are often found frozen to death in the hedges. They are very cleanly in their habits, and appear to derive much enjoyment from bathing and preening their feathers. They accommodate themselves easily to diversities of climate, and live to the age of seven or eight years; but from the attacks of birds of prey, and abandonment of nests, they are not so numerous as might be expected. They eat all sorts of berries, fruits, and insects, and display much cunning and ingenuity in hunting for snails in gardens during the winter, and breaking the shells against the wall or hard ground. The number of noxious creatures destroyed by these birds is surprising; but the good they do in this way is too often lost sight of by growers of fruit. Blackbirds, there is little doubt, have to answer for the misdeeds of other depredators. Their bright yellow bill and dark plumage cause them to be more easily detected than birds of the ordinary colour; they have, besides, the habit of uttering a quick shrill cry of alarm when suddenly disturbed, which naturally draws attention. They have thus come to be regarded as insatiable destroyers of fruit, and in many places a war of extermination is carried on against them. Others of the feathered race have suffered from the same prejudice, which arises entirely from a want of true knowledge. The best-informed naturalists agree that birds are more sinned against than sinning. A remarkable instance occurred about the middle of last century in New England: there was a general failure of the crops, and the inhabitants, attributing the deficiency to the depredations of jackdaws, turned out, and shot every bird of that tribe they could find. But for some years afterwards, such was the prodigious increase of insects and reptiles, that the crops were but little increased.

A grass plot attached to a country-house was once visited by a dozen or two of blackbirds for several days in succession; they ploughed it up so diligently with their bills, as to make the surface look rough and decayed. The owner of the property, unwilling to shoot the intruders, caused the grass plot to be dug up in several places, when it was found to be overrun with the larvæ of chafers. The birds were left in undisturbed possession; and although the walls were covered with ripe fruit, they left it for the grubs, which they effectually destroyed, and the grass plot soon resumed its original appearance. We can fancy the humane proprietor here spoken of acquainted with Tennyson's thoughtful lines—

'Oh, blackbird! sing me something well;
While all the neighbours shoot thee round,
I keep smooth plots of fruitful ground,
Where thou mayst warble, eat, and dwell.

* * *

Yet though I spared thee, kith and kin,
Thy sole delight is sitting still,
With that gold dagger of thy bill
To fret the summer jennet in.

A golden bill! the silver tongue
Cold February loved is dry;
Plenty corrupts the melody
That made thee famous once, when young.

* * *

Take warning! He that will not sing
While yon sun prospers in the blue,
Shall sing for want, ere leaves are new,
Caught in the frozen palms of spring.'

Amongst other freaks of nature, she sometimes produces a white blackbird; an instance occurs in Willoughby, together with this writer's explanation of the phenomenon. 'On the Alps,' he says, 'the Apennines,

and other high mountains, are sometimes found birds of this sort all over white. We ourselves saw one in a poulterer's shop at Rome, partly-coloured of black and white. But this we look upon as accidental: either the coldness of the region, or the constant intuition of snow, effecting this alteration of colour—as in crows, ravens, &c.—so that we do not think a white blackbird (pardon the seeming contradiction in *adjecto*) to differ specifically from a black one.' The same fact had not escaped the notice of older writers: Pliny believed the blackbird to turn red in winter. Le Vaillant describes an African blackbird, called, from its note, the 'John-Frederic,' and another, which seems to repeat the Dutch phrase, *Piet, myn vrouw*. There is also a blue blackbird, found in Gibraltar, the Pyrenees, and the islands of the Mediterranean: its singing very much resembles that of the nightingale. Instances of white blackbirds have been met with in this country: the *albino* is generally found in a nest with three or four others of the natural hue; sometimes the head only is white. There was one, about ten years since, in the Zoological Gardens at London, which had been taken in Northamptonshire; and a stuffed specimen, cream-coloured, is preserved at the British Museum. On the continent, the flesh of blackbirds is esteemed a great delicacy, particularly after the *vendange*, or grape-harvest—they are then fat and in good condition. Preference, however, is generally given to those which have fed on olives and myrtle berries. By ancient physicians the flesh was regarded as provocative of good-humour, and easy of digestion. They prescribed it as a remedy against dysentery and colic: the gall dissolved in vinegar was an excellent cosmetic for the skin. The oil contained in the body of the bird was applied for the cure of sciatica; and this oil, together with the volatile salt supposed to abound in the flesh, was said to render it a specific against the plague. Blackbirds, it is said, were once rare in the north of England; but now they are numerous, and in the neighbourhood of Newcastle have almost driven away the common thrush. In the Orkneys, the bird is called the *chucklet* from its winter note—chuck, chuck. The power of imitation is strong in the blackbird: one has been heard to give a respectable version of the nightingale's melody, and another to crow like a cock. The latter sat perched on a tree close to a mill where poultry were kept, and evidently enjoyed the imitations. Sometimes it broke off in the middle of the cock-a-d—, flapped its wings, and whistled its ordinary note. When kept in the house, the birds will imitate many sounds of the human voice, and may be taught little airs, which they seldom forget.

The natural song of blackbirds can only be heard in perfection when they are at liberty: it is too powerful to be listened to in-doors: in winter, their voice becomes hoarse and disagreeable. They begin to sing with the earliest dawn, and may still be heard when twilight is deepening into darkness, especially on the evenings of close, sultry days. Gilbert White enumerates the blackbird among others which are silent about July or August; the latter, he observes, is the mutest month of all the fine season. In September, when the woods begin to put on their autumnal tints, the blackbird may again be heard 'whistling from the thorny brake,' and he retains his musical voice until the cold weather has fairly set in. Different opinions prevail as to the character of the blackbird's music. Aristotle describes the bird as stammering and chattering in winter, but in summer growing darker in colour, and making a loud noise with open throat. 'The cocks,' says Willoughby, 'are very canorous, whistling and singing very pleasantly all the spring and summer-time, only their note is too loud and shrill near hand.' To some ears the note suggests nothing but melancholy—a chant of lamentation; the hearers, however, must have been in a melancholy mood, for the music is peculiarly cheerful and exhilarating. 'The male blackbird,' in the words of an intelligent observer, 'is one of our

most beautiful songsters: his song consists of many strophes, following at short intervals, among which are some more staid chirping hoarse notes, varied with clear whistles; but it is specially distinguished, and heard at a great distance, by a loud flute-like *tratac tratac*, which has also been compared to the sounds *dauid, hane dauid*.' According to Bechstein, 'the natural song of the blackbird is not destitute of melody; but it is broken by noisy tones, and is agreeable only in the open country. When wild, it sings only from March to July; but when caged, during the whole year, except when moulting. Its voice is so strong and clear, that in a city it may be heard from one end of a long street to the other. Its memory is so good, that it retains, without mixing them, several airs at once, and it will even repeat little sentences. It is a great favourite with the lovers of a plaintive, clear, and musical song.'

The blackbird's music has found responsive echo in many a heart; many a 'mute inglorious Milton' has been inspired by it, whose thought never expressed itself in words. The peasant poet Clare alludes repeatedly to the 'never-caring blackbird;' and we may conclude our notice of this interesting warbler with a sonnet in which the musical inspiration is happily conveyed—

'Methinks, methinks a happy life is thine,
Bird of the Jetty wing and golden bill!
Up in the clear fresh morning's dewy shine
Art thou, and singing at thine own sweet will:
Thy mellow voice floats over vale and hill,
Rich and mellifluous to the ears, as wine
Unto the taste: at noon we hear thee still;
And when gray shadows tell of *Sol's* decline.
Thou hast thy matin and thy vesper song;
Thou hast thy noontide canticle of praise
For Him who fashioned thee to dwell among
The orchard-grounds, and 'mid the pleasant ways
Where blooming hedges screen the rustic throng:
Thy life a ceaseless prayer, thy days all Sabbath days.'

OCCASIONAL NOTE.

LINGERING PREJUDICES AGAINST SCOTLAND.

In a recent trial before the Court of Queen's Bench, a barrister, wishing to show that a witness could not have been simple enough to sign a particular self-condemnatory document without reading it, thought it a good point to show that he was an attorney; but this was not enough—he was a Scotch attorney; as if nothing but the shrewdest regard to his own interest was to be expected from a person so describable. The nature of the individual case is nothing to the purpose; but in so far as a great body of people is reflected on, we think ourselves called on to protest against the climax of the learned counsel. It belongs to a class of prejudices which we thought had long been left to the most ignorant of our southern compatriots. It surely is unworthy of an educated person of our age thus to sanction and assist in keeping alive antipathies to which a legislative measure of a hundred and forty years' standing gave a practical *quietus*. We should have thought that the evils arising from such antipathies were exemplified in so strong a manner in another section of the empire, that any rational or considerate Englishman would hesitate to evoke even a dormant specimen of this most unhappy class of feelings. Fortunately, Scotland is so contented in the enjoyment of the well-earned fruits of her own honourable industry, that she can afford to smile at such poor shafts of wit. But the discredit of launching them is not on this account the less.

It occurs forcibly to a Scotchman on hearing of such pellets being thrown at his country, through the English journals or any other medium, that the conduct of the chief of the three nations to the Irish proceeds on a strikingly diverse principle. From Ireland—no matter from what cause—England has for many years experienced extreme annoyance. Ireland is the millstone round her neck. She spent seven millions upon Ireland

in one year. Listen to a private individual Englishman, and he tells you, beneath his breath, that he is sick of this murderous beggarly associate, in whom he finds no honour or truth, but an endless, thankless 'Give, give!' England, however, publicly treats this matter with signal tenderness—no jibe, such as that of our barrister, would be ventured on in either the Queen's Bench, or the House of Commons, or at any public meeting. England dare not use such terms towards Ireland. It is curious to see her less considerate sons so ready to venture on jokes to the discredit of Scotland, which for centuries has given no offence—but from which *nothing is dreaded*. How far the contrast is honourable to her, we need not stop to consider.

We have already given more lines to the subject than it is worth; but a general remark may yet be allowed. If England has any sympathies with the two associated kingdoms, they flow as six to one in favour of Ireland. How like this is to the way of the world in private life! Literature and common talk are full of the cant of a sentimental interest about unfortunate persons, however truly the authors of their own misfortunes, and even although some dash of criminality, romantic or otherwise, may attach to them. But the worthy, industrious, frugal man, who sees after his own affairs and troubles nobody—who fulfils all the great duties towards his family, his friends, and the public, not excepting an abundant but modest beneficence towards the meritorious poverty round about him—that is a kind of man of a different stamp. He is not picturesque. He does not excite benevolence. Perhaps his success in life rather provokes envy. No one has any sympathy for him. This is the case of Scotland. Of course, in the satisfaction arising from duties well performed, and aims wholly legitimate and praiseworthy, there is ample compensation for every injustice that may arise from prejudices so vulgar and so ridiculous.

WALKS TO OFFICE—CAPRICORNUS TO CANCER.

We have read of a man whose whole life was passed in London, and who, walking daily to and from his official duties during a period of forty years, never found anything worth jotting down in his diary except his dinners and the name of the house in which they were eaten. Just imagine an individual, after nearly half a century of active service, retiring on a 'superannuated allowance,' with no other record of the past than a big catalogue of masticatory achievements! What a resource on rainy days, when the newspaper was exhausted, and the customary stroll could not be taken, to bring out the heavy volume, and 'chew the cud of sweet and bitter fancies' over its suggestive memoranda, which might run thus: Feb. 19, 1830—Dined in Butcher-hall Lane; almonde beef and college pudding; half-and-half; or, July 6, 1831—Lamb chops and asparagus at Pamphilon's; gooseberry tart; cheese; stout! It follows, of course, that the writer of such a journal must be a bachelor; a wife and children would have given him something better to do than keep a chronological account of eatings and drinkings. Were it possible to investigate motives, we should perhaps find nothing but the physical fact of a good digestion. That a man may never write anything is within belief; but that one who kept a diary, and walked about the streets of London for a lifetime, could never find an accident, or a foggy day to commemorate, staggers credibility. It is possible that the very greatness and multifariousness of the subject may make 'taking notes' difficult or impossible to an unpractised hand. A slight habit of observation will, however, detect a thousand things in the restless, roar-

ing streets, better worth recording than the items of departed dinners. How the continuous tide of human life pours on, hither and thither, in a resistless current, offering in itself a mighty range for contemplation! We know an old lady who shed tears as she stood and watched the multitudinous life of a busy thoroughfare; and truly is it impressive, presenting as it does every variety of human character. There are things to be seen and heard among the crowds that throng the streets of London, which can be seen and heard nowhere else, and which are as much a part of London as its parks and public buildings. The jibe and jest of folly—the hard sententiousness of business—the sneer of envy—the groan of misery—are strangely mingled in London.

We have lived for some years in London, and in our daily peregrinations through the streets, many objects have struck us as noteworthy, which may possess a general interest. Our residence is 'over the water,' which means on the Surrey side of the Thames, about three-quarters of an hour's walk from Blackfriars Bridge, away in what is at present debateable ground between smoke and sunshine. We are just out of one of the main thoroughfares, down a short lane, on one side of which is a real hedge, such as you see miles away in the country, and a goodly sprinkling of trees; and at night, all is as quiet as in a country village. We start in the morning at nine, and walk fast or leisurely according to the season; and if we have a few minutes to spare, can always dispose of them profitably at some book-stall on the way: many stray facts and valued volumes have we picked up by this means at little cost. In the winter, when the weather is fine, we step at once from our door on to a hard frozen path, that rings beneath our feet; the hedge and trees are white with a frosty incrustation; and on reaching the high road, we find its clean surface striped by countless wheel-tracks. But after the first furlong or two, the brightness and naturalness of surrounding objects deteriorate with every step of progress citywards, in a gradually-increasing uproar, gloom, and dinginess. Half a mile behind, all was clean and crisp; now the pavement begins to look as though it had been coated with damp ashes, which, a little farther on, are transformed into black slippery mud, trying to the pedestrian's patience, and provocative of ire in omnibus conductors and cab drivers. When you started, the sun was shining in a clear sky; but as you went on, he began to look a little tawny, then brown, and now he looms in lurid redness through the smoky atmosphere, which deposits itself in New Zealand tattoo lines round your eyes, nose, and mouth, makes your breath look as though it came from a coke-furnace, and half stifles you into the bargain. The white rime still clinging to the tilt-cover of wagons coming in from the country, is looked at with astonishment by people in the streets, nine out of ten of whom would hardly believe that the atmosphere is clear and exhilarating at a distance of two or three miles. The gloom deepens, and you are past all doubts as to its being one of the annually-recurring genuine London fogs. Gaslights are burning in the shops, flinging bewildering shadows across the streets, and making everything look strange and spectral. On crossing the bridge, the fog seems denser than ever—not a glimpse of the river is to be seen. Steamboats, however, are feeling their way along, and the murky fumes from their funnels remind you of smoke-vomiting monsters in some Dantean inferno. Sometimes the dismal pall lifts and floats away about the middle of the day, and the glad sun comes out (for it is mostly in clear weather that

the real metropolitan fog makes its visitation), and man and beast can breathe again. At other times, it clings all day, and creates a scene, on the approach of night, scarcely possible to describe. The gas lamps are of no more use than farthing rushlights; omnibus drivers lose their way in Fleet Street and the Strand, or mistake Temple-Bar for the Horse Guards, and shout to one another as mariners navigating an unknown sea. The habitual frequenter of the streets is as much at a loss as the veriest stranger: to walk is almost as adventurous an undertaking as travelling in the desert without a compass; and when, on nearing home, you emerge from the smoke, you draw a long breath with a feeling of having escaped some horrid calamity, and lost a day.

Such is one of London's phenomena: but the same walk presents other characteristics for consideration, moral as well as physical. Nowhere is the struggle for existence so apparent as in the suburbs of the huge city, and nowhere is it attempted under more hopeless circumstances. The effort may probably be more intense 'in town,' but it is more concealed, masked by the profusion of brass, blaze, and glitter. But here, in the outskirts, where there is as yet no neighbourhood, no back streets swarming with a poor population, always ready-money customers, the attempts to establish a business seem little better than frantic. In some, the fraudulent intention is palpable from the very outset; but others excite our sympathy. A newly-married couple come out, and take one of the 'run-up' houses, all shop and closets, for which the suburban approaches to London are famous. The husband is a respectable artisan, or clerk at a coal-wharf; his wife has learned dress-making, and incontinentally the window is filled with little frocks, coats, and caps for children, ticketed at foolishly low prices to tempt purchasers. 'FIRST FLOOR TO LET' stares you in the face from the central pane, day after day, as you go by; but the accommodation is too raw, and the rooms too small, for a respectable, quiet lodger; and they either stand empty, or, as the rent must be made up at all events, are let to a man employed at a neighbouring glue factory, who manages to squeeze his household gear, wife, and two children into them. Henceforth a dirty blind gives a squalid appearance to the first floor window: the struggle, however, goes on below: the trim and showy articles first exhibited disappear, and give place to others of a plainer style; and a glance at the interior shows you that the shop window contains the whole of the stock in trade. At last, on passing some morning, you see the shutters closed: the inmates have made a moonlight flitting of it, and gone to tempt fortune in another parish, or to hide their disappointment in a lodging close to the husband's place of business. The history of one is the history of a thousand—green-grocers, haberdashers, stationers, whatever may be the business. A few struggle on for a few years, until back streets are built, which drain them off from the main thoroughfare; better and larger shops spring up, and their places are taken by tradesmen with capital. What eventually becomes of all those who do not succeed, must remain matter for grave speculation.

The great human tide begins to flow citywards as early as six in the morning. A few scattered mechanics and porters are then hastening to their work. At seven, the number is augmented, with here and there an 'assistant,' or a bookseller's 'collector.' At eight, troops of merchants' and lawyers' clerks make their appearance; and from the hour at which their daily employment begins, are called the 'Nine-o'clock-men.' A few stragglers from this division fill up the next hour, when the 'Ten-o'clock-men' may be seen all going in one direction along the now busy thoroughfare. They are generally more advanced in life, and more staid in appearance, than those who preceded. Many are picked up by the omnibuses, which now come speeding on, crowded with passengers who must be in the city by ten. Not a few, however, prefer to walk. They fall in with acquaintances, by whose side they have paced the same

route for years, and their conversation, as you may hear in passing, is mostly of a hearty, cheerful tone—the inspiring effect of a good breakfast. With what generous pity is their hand often thrust into their coat pocket for stray halfpence to be dropped into the outstretched palm of some shivering beggar; and they seem to have a friendly word or nod for almost every one they meet. There is a contagious cheeriness in all this, but it is liable to fluctuation. We have watched those same individuals on their return from office, at four in the afternoon; their manner is then reserved, not unfrequently abrupt and somewhat snappish, which effectually keeps beggars at bay, and intimidates crossing-sweepers. We were long at a loss to account for this transformation of character, until a friend, well experienced in the phenomena of urban life, whispered that a Londoner going home to his dinner is always impatient and out of temper.

Now you meet a troop of German musicians, in round white hats, or slouching Italians with barrel pianos, on their way to the farthest suburban limit, from whence they play their way gradually homewards. Street music, compared with what it was a few years since, has undergone a great improvement. Young females occasionally pass you, coming from town, with a thin book or roll of music in their hand. How various are the characters they present!—some thoughtful and anxious, others mechanical and business-like, others, again, flippant and restless. They are governesses going to their daily task of teaching and training young children. You may read their qualifications at a glance, and discover those really fitted for their office. Some few who receive an adequate salary may be seen in the omnibuses; they are of the better sort: but for most, teaching is a weary duty, undertaken as a last resource. Here, too, you meet men with portfolios under their arms—artists who give lessons at a guinea a quarter. How sensitive they appear of being too closely scanned, for none but themselves know the trouble they have to retain a show of respectability about their threadbare garments! It is rare, even in the coldest weather, that you see them wearing a cloak or overcoat, and the attempt to brave it out is obvious. The struggle in many cases must be most painful and melancholy. How much more independent and contented appear the men hawking garden stuff in wheelbarrows, or bakers delivering their customers' bread! But it is of such that a large proportion of the necessitous world consists, which shrinks and suffers unseen within the greater world of London, all pleasure or business around them. The sparse traffic of the suburbs affords them no concealment, and the sight of them lets us into many a secret of the struggle for existence in the crowded metropolis.

How the cries and confusion increase as you approach the more crowded streets! The shops, too, have an air of business about them, and are less precariously supported than those you have hitherto passed. Here and there, however, you still see one whose existence depends on those of uncertain ways and means, where viands of most equivocal appearance are exposed for sale, while a scrawl on a black board announces, 'Hot sheep's heads every night from eight to eleven.' Another will be, 'Notorious halfpenny shaving-shop.' A third declares a 'Rise in bones, and old iron,' adding, by way of postscript, 'Any gentleman's black eye cured in five minutes for twopence.' A few yards farther, you read, 'Ball this evening at seven; tickets threepence each, refreshments included!'—facts pregnant with meaning, exhibiting the physical resources of a numerous class of the population.

When the suburban roads converge, and pour their traffic into one line of street, it is no longer easy to detect individual characteristics; groups must now be taken instead of units. You need no other warrant that Christmas is nigh than the grocers' shops. What a profusion of plums and currants, spices and candied fruits! In fact, you have only to look at a grocer's or linendraper's window, at any time of the year, to know

what mouth you are in. Cheap and bright sugar is displayed as a 'leading article': go in and buy a pound—it is kept ready weighed and papered—and on opening the packet at home, you will find the contents marvellously darker in colour than the sample exposed in the window. Call for a pound of butter at a provision shop, you will always see a weight left in one of the brightly-polished scales. If it be necessary to change it, the one required is always thrown in before the first is removed. This is so invariably the case, as to excite a suspicion of unequal balance. It is, however, regarded as one of the legitimate advantages of trade, arising out of the keenness of competition. Widely ramified, it descends to the lowest. Cast an eye into the measures of the vendors of nuts and gooseberries in the streets, you will see a false bottom placed so as to diminish the interior capacity by one-fourth. We once asked an old woman, whose stand has been for years on the approaches to Blackfriars Bridge, whether she felt no compunction for her daily frauds on the public. 'Sure,' was the retort, 'doesn't everybody do it, and could I get a living if I didn't do the same?'

On passing the cab-stands, you may observe that the drivers seem more than usually alert during the hours that business men are making their way into town. If you chance to turn your head, a dozen fingers are held up to answer what is considered a call, and as many voices cry out, 'Keb, sir?' It is puzzling at times to know how these men get a living, paying as they do fourteen shillings a day to the owner of the vehicle. They like to see the day begin fine, and come on rainy at ten or eleven in the forenoon, after people have been drawn from their homes. On the approach of a shower, every cab is off the stand in an instant, as if by magic; and the 'waterman' runs hither and thither hastily to collect from each driver his lawful fee of one halfpenny for every fare that leaves the stand. A shower clears the pavement rapidly: people who have no umbrellas shelter themselves forthwith under awnings, covered passages, or gateways, and watch the falling drops with manifest impatience, or quiz any unfortunate wight forced to abide the storm. The Londoners astonish their country friends who venture to town, by recommending an observance of a rule of town life, 'Always take your umbrella when it is fine; when it is wet, do as you like.'

But all this while the season is getting on: the lamps are no longer lighted at four in the afternoon; the smoke seems less dense, and patches of blue sky are occasionally visible; thick and heavy overcoats have gradually retreated in favour of the light wrapper or 'Tagioni,' and the latter will soon follow, as the sun acquires power; women come out in shawls and mantillas instead of furs and cloaks; enterprising painters have begun to 'decorate' house fronts in the suburban roads; grass plots and box edgings in the little front gardens are clipped; early flowers peep out, and newly-gravelled paths give a cheerful aspect to the diminutive enclosures; a tinge of green appears on the bare branches of the trees that border the road, and the ivy, that thrives in spite of the smoke, wears a brighter hue, refreshing to the eye after the dreary months of winter. By and by, the lilac and laburnum are in full bloom, and you may almost cheat yourself with the fancy that the first mile of road is a country walk. But it is singular to note the change on nearing the more densely-populated districts. It was a fine day when you started—casual acquaintances said so. A mile farther on, where everything is deadened by a damp haze, it is also a 'fine day'; and as you go on, and find mud and murkiness, people still say a 'fine day.' Anything short of down-right rain is a fine day in London.

Steamboats that had been laid up for the winter are now swarming on the river, in all the pride of new paint; and for a halfpenny, we may often enjoy the breeze for a mile or so on our way to office. Pleasure vans, too, filled with glad parties for Hampton Court, resume their trips, most numerous on a Monday—Saint

or Blue Monday being more perseveringly kept than any other holiday in the London working-man's calendar.

WANT OF LABOURERS IN AUSTRALIA.

ATTENTION has been lately drawn to the deficiency of labourers, more especially shepherds, in the Australian colonies, and New South Wales in particular. Probably the want has been immediately felt in consequence of the recent stoppage of the stream of convict exiles which long poured into these distant settlements. Be this, however, as it may, the demand for labourers is at present unusually great.

In lately conversing with a gentleman, a large stock-farmer from Australia, we found him speak with earnest solicitude on this subject. 'Things,' said he, 'have taken a great change for the better with us. From our vast pasturages we can produce any imaginable quantity of wool and tallow, articles always sure of a market; but of what use are these great sheep-walks, unless we can get shepherds?' 'What kind of men would best answer?' we inquired. The reply was—'Any man of active habits and trustworthy character would answer: in fact, I have known first-rate shepherds who were once London cabmen: we don't expect professional shepherds who are well off at home to come out to us.' As corroborative of this general demand for labourers, this person brought under our notice the case of his relation, Mr Boyd, who had chanced to visit Australia at the time when sheep were at their lowest value, and had been tempted to embark largely in wool-growing. Finding himself, however, greatly embarrassed for want of assistance, he resorted to the novel and hazardous experiment of introducing natives from the not very distant islands in the Pacific. Having procured a vessel for the purpose, he instructed its commander to call at as many inhabited islands as possible, so that he might satisfy himself not only as to the people best fitted for the wants of the colonists, but also as to the number likely to be procured. 'In due time,' to adopt the language of the *Times* in its account of the expedition, 'the vessel returned with sixty-five of the natives of the New Hebrides group (distant about three weeks' sail from Sydney), of various ages, from fourteen to twenty-five; while the general accounts given of the cruise were such as to warrant an expectation of satisfactory and extensive results. Mr Boyd's wish was, that in the first instance only fifty should be engaged; but so eager were these people to be taken on board, that it was only through the authority of their chiefs that the number could be limited; the explanation of this desire for removal being, that the inhabitants of all the Coral Islands are in a condition, during upwards of eight months of the year, little short of starvation. With respect to the habits of the people, and their fitness for the occupations of civilised life, it is stated that although cannibalism and infanticide prevail amongst them to a fearful extent, they manifest in their intercourse with strangers a very great degree of tractability and intelligence; and hence it is considered that their vices may be attributed rather to the influence of the sufferings to which they are periodically exposed, than to any ineradicable peculiarity. The expense of introducing them is about £8 per man, and Mr Boyd's intention is to employ them as shepherds. At the same time, from the description given of them, it would seem that they might easily be instructed for other services. Regarding the conduct of the party during their three weeks' voyage, the master of the vessel reports as follows:—

"My first care on getting to sea was to limit the quantity of food for each person, particularly salt meat; to have the hold well aired and constantly cleaned, &c.; and so successful have I been in my endeavours to preserve all in a healthy state, that I landed them all at Twofold Bay, with only one slight case of dysentery having occurred during the passage. And I cannot refrain

from mentioning the grateful attachment they have all shown to me, as it exhibits a trait in their characters rarely found amongst savages, and one which will contribute in no small degree to render them manageable during their residence in the colony; but on this score I have no doubt: as short as the time is that they have been with me in the *Velocity*, they have already learned to make themselves useful, and the alacrity with which they endeavoured to obey any order I gave, fully proves their inclination to work."

'With reference to the numbers to be procured, he adds—"I have no hesitation in assuring you, that from the various groups in the vicinity of New Holland, this vast island, now nearly uninhabited, may be supplied with an almost unlimited number; for as the miseries of an over-population are removed by emigration, the crime of infanticide will cease, and the desolating effects of perpetual warfare—not only carried on for the purpose of eating the slain enemies, but also in the hope of plundering the enemy's country of the fruit and roots produced in it—will end when the principal cause is removed."

'Perhaps the chief danger to be apprehended is the common one in all these cases, of the temptation of intoxicating drinks. It must also be remarked that the number imported by Mr Boyd consists entirely of males; and that if this practice be persevered in, there can be no doubt of a repetition of the evils which not many years back were denounced in the first attempts at Coolie emigration to the Mauritius.'

In this latter remark we cordially agree, and trust that Mr Boyd will find it to his interest, as it is certainly his duty, to maintain something like an equality of the sexes in his importations. By the last accounts, the New Hebrideans employed by Mr Boyd on the Murray River were so well satisfied with their treatment, and so zealously and conscientiously have they worked for their employer, that it has been deemed expedient to return three of them, that they may make a correct report to their fellow-islanders, and induce a more general emigration. All are represented to be an intelligent body of men; and, what is rather remarkable, possessing great powers of calculation by a system of decimals.

However advantageous and humane it may be to remove from their famished homes these poor islanders, it is surely in every respect a more incumbent duty to remember that there is famine among ourselves, and that we could very well spare many who cannot earn their bread at home. But the colonists cannot be expected to be the importers of our spare citizens, at the great distance at which they are situated from us. Emigration on a considerable scale, and under proper precautions, would require to be carried on by the government as a public duty. We subjoin on the subject an extract from a private letter, dated Melbourne, May 2, 1847, which a correspondent hands us for insertion:—

'In late English papers I have read most harrowing details of the sufferings and positive state of starvation of large masses of the Irish people; and I believe the poor-rates are pressing heavily upon the middle and lower classes in England. At the same time a complete check is put to the advance and prosperity of the whole of the Australian colonies from a deficiency of labour, which has already existed some years, retarding their progress, and has now reached a point which will shortly put a complete stop to their advance. It is distressing to reflect that, whilst such misery exists in the United Kingdom, thousands upon thousands of oxen and sheep, scarcely surpassed in quality in any part of the globe, are being slaughtered with us to supply the soap-boiler and the steam-engine—being melted down for the tallow alone. We have already, I may say, a redundancy of food: meat is from three-halfpence to two-pence per pound, and must soon come lower still, unless the population be materially increased, or an outlet found for fat stock by an extensive system of salting for exportation. Of bread, and other sorts of food, the

supply is only limited by the scarcity of labour and the small demand. With an abundant supply of labour, the capacity of the colony for production is almost without limit.

'Such is the scarcity of labour at the present time, and such are the apprehensions in consequence felt, that many influential men have memorialised the government for the renewal of transportation to New South Wales. I may observe, however, that this step has been strongly reprobated by a large majority of the community. The pressure of high wages is so great, however, that the emancipists and ticket-of-leave holders from Van Diemen's Land are brought here by societies formed with that object. These importations are loudly denounced by the townspeople, who are great sufferers by the increase of robberies thereby occasioned—the police being sadly deficient in numbers and honesty. There is no doubt that the influx of these Vandemonians has eased the labour market greatly, as the men are generally expert in shearing, splitting, and farm-work, and, if they turn out well, are more useful, and are under better control, than free emigrants, who give themselves all sorts of airs, and are never satisfied. The most useful man, and by far the hardest worker we have yet had in our employment, is an emancipated convict. But on the other hand, the greatest rogue that my brother was ever troubled with was also one.

'The majority of the colonists are very strongly opposed to the introduction of these Pentonville exiles (Penton Villains, or Patent Villains, as they are called). Several of them have already figured at the police courts. In the early days, the importation of these very doubtful characters would have raised a clamour through the whole length and breadth of our virtuous and unpolluted colony; but the fear of contamination, once so strongly urged, has given way before the pressure of high wages, and the self-interest of individuals; and the introduction of any sort of labour, whether penitent villains, or double distilled rogues from Van Diemen's Land, is not only reluctantly submitted to, but openly encouraged. The last batch of Pentonvilles included two lawyers, a clergyman of the Scotch church, and a lieutenant in the army. The most amusing stories are related of these gentlemen. One left his card at all the mercantile houses in town, with an intimation that he would accept a situation as managing clerk, with a salary to commence at L300 the first year, to be increased subsequently. Another wished to engage as a private tutor. Some one suggested that he would do well to take a situation in the bush, to serve out stores, and to combine teaching with other duties. His indignant reply was, as he turned upon his heel, that "that was an amalgamation of professions of which he did not at all approve." A third advertised for board and residence with a genteel family! But almost all of them hold themselves in the highest estimation, and scorn any but the highest rate of wages. Meanwhile house robberies are becoming of nightly occurrence, and the streets may scarcely be pronounced safe after dark. The town presents the finest field imaginable for burglary, and the bush an equally good one for cattle-stealing—accordingly, while one branch of the profession cleared out the country-house of a magistrate, the country thieves, not to be outdone, swept above two hundred head of cattle off a run, brought them into the public market, and sold them by auction. Whilst the lead is taken with such spirit, of course there are numerous humble imitators.

'Shepherds' wages are from L.26 to L.30, according to the experience of the men; farm servants, L.30; female house-servants, L.22 to L.25; married couples, L.45 to L.55; and I have known boys of twelve years of age to get L.16. These wages are of course accompanied with ample rations. I find our servants to be very wasteful; they have such an abundance of good food at their command, that they become careless and dainty, and throw to their dogs as much meat and bread as would support at least one person.

We pronounce no opinion on the credibility of the above, further than that we received it from a respectable quarter; and this suggests to us the repetition of a former advice to colonists, as to the proper steps to be taken for making their wants properly known at home. They must not trust to the people of England hearing anything of them through the colonial papers; for these papers are seen only by a few persons. Neither ought they to trust to a mere statement of their grievances to the colonial office. They should draw up a memorial, duly authorised, and have it published in the principal newspapers of Great Britain, so as to bring it directly under the eyes, and within the sympathies, of their fellow-subjects. It is not too late to adopt this practical measure as respects the demand for labourers.

MOTTOES.

PROVERBS are a condensation of common experiences adapted to universal comprehension; mottoes are a concentration of individual thought or feeling in one point; and consequently both mottoes and proverbs are worthy the attention of the student of human nature, as indicating much more than they express. A 'motto,' the Italian for 'word,' though now understood to be a short phrase full of meaning, was at first an expressive exclamation, accompanying those heraldic devices used by our ancestors as emblems of their piety, their anger, or their love; or to commemorate any extraordinary adventure into which those passions had led them. Most of such mottoes were in Latin or French, because those languages were almost exclusively used by the two learned and warlike orders who ruled over society in what we now call the dark ages. Shortly, the motto of the baron or knight who led his vassals to the crusade, or to the still more reprehensible attack on his next neighbour, became their slogan, war-cry, or watchword; and, when well chosen, often contributed to success in battle. What power and extent of territory were acquired by the Dukes of Normandy while they led on their followers, shouting their famous war-cry, 'Dieu aide!'—'God helps us!' which, to believe, was better for a man in the fierce struggle with his fellow-man, than breastplate, or helmet, or two-edged blade. In fact, so much did these war-cries foster the spirit of partisanship, that it became necessary in our own island, when the wars of the 'Roses' were terminated by the marriage of Henry VII. to Elizabeth of York, to pass an especial act of parliament for their suppression, making it penal for nobles or their followers to use any cry but that of 'St George for England!' or 'The King!'

The motto of the royal arms of England, 'Dieu et mon droit!' has a disputed origin; some writers attribute it to Richard I., who adopted it to imply that he held his crown from no other sovereign, but only by Divine permission and hereditary right; others affirm that it was first used by Edward III. when he laid claim to the French crown in right of his mother Isabella. Certainly it is from his reign that we date the existence of the Order of the Garter, with its famous motto, 'Honi soit qui mal y pense!'—literally, 'Evil be to him who thinks evil of it!' as well as the adoption of mottoes on seals. One of the earliest impressions of a seal with a motto is one affixed to a deed executed by an ancestor of the Byron family, dated in the twentieth year of Edward III.; it is, 'Crede Be-runt!' The present motto of the family is, 'Crede Byron!'—'Believe or trust in Byron!' From this period the use of seals was rapidly extended; and not only were large sums of money given for gems, for the purpose of converting them into seals, but the newly-awakened arts of design and engraving were eagerly employed to make them at once ornamental and expressive.

The three feathers of the Prince of Wales, with the German motto, 'Ich dien!'—'I serve!' are supposed to

have been the arms of that king of Bohemia who was conquered on the field of Crécy by Edward the Black Prince, and were therefore adopted by him; other heraldic writers assert that they were borne by the Princes of Wales who first paid tribute to the crown of England, though still independent princes. However they may have originated, these mottoes have been used successively by the monarchs of England and their eldest sons from that time down to the present day; excepting that William III. took for his, 'Je maintiendrai!'—'I will maintain!' and Queen Anne for hers, 'Semper eadem!'—'Always the same!' a sort of admission, on their parts, that their right to the throne of England was not indisputable.

The kings of France have for their arms three fleurs de lis, or lilies, which were sent, says an old tradition, 'by an angel from Heaven; and the flowers being in manner of spears, were given to the king of France in sign of everlasting trouble, that he and his successors all way with battle and swords should be punished.' With such a prophecy hanging over them, and such a retrospect as the Revolution, the house of Bourbon do well to take 'Espérance!'—'Hope!' for their motto.

It is a gratifying fact, that when mottoes fell into disuse as war-cries, they were adopted for another and far more interesting purpose. Printing was just invented, and rose, if not rapidly, at least certainly, to be the most important art that the mind of man could devise, or his hand could practise. Learning, hitherto confined to the college or the cloister, was now diffused among mankind, visiting the court, the camp, and the city, and humanising all who owned her influence. Printed books superseded the rare and costly manuscripts heretofore in use, and found such eager and numerous purchasers, that spurious and imperfect editions of the more celebrated works began to be circulated. To remedy this evil, and to give security and protection to those printers whose publications combined great literary merit with rare typographical excellence, princes and potentates granted them permission to use on the title-page some symbol and motto, to counterfeit which was legally as well as morally criminal. Thus Aldus Manutius, who established the famous Aldine press at Venice, and was the inventor of the type called Italic, adopted for his sign on his title-pages a dolphin and anchor. Henry Stephens, the founder of the celebrated family of printers of that name, when established at Paris, took for his symbol an olive-tree, which long continued to be used by his sons, particularly by Robert, the most eminent of them, who was equally noted for virtue, learning, and skill in his occupation. It is of him that an anecdote is recorded, worthy to be coupled with that of Charles V. picking up the pencil of Titian, for it took place about the same period, and is as honourable to Francis I. as is the better-known condescension of his famous rival. Everybody knows that Charles patronised Titian; that our Henry VIII., rude and brutal as he was, protected Holbein; and that Leonardo da Vinci died in the arms of Francis: few know that the same Francis, going, as was his custom, to the printing-office of Stephens, found him engaged in reading a proof. The courtiers in his train would have required the instant attendance of the printer; but Francis, ever high-minded and chivalrous, would not allow the interruption, but waited until he had finished—a small enough condescension, it may perhaps be thought, but a great one in the then state of society. For this monarch, who was a judicious promoter of learning and the fine arts, books were first ornamentally bound, having the edges of the leaves gilt, and the arms and motto of the owner impressed on the covers.

One of the earliest printers, of much celebrity in England, was Henry Day, who enjoyed the favour of Queen Elizabeth. Upwards of two hundred works issued from his press, all distinguished by his symbol—the rising sun, with a boy awaking his companion, with the words, 'Arise, for it is day!' in allusion to the dawning day of Protestant reformation, which was much pro-

moted by the dissemination of tracts, now first printed and published. Day was the inventor of the Saxon letter. Christopher Plantin, of Antwerp, adopted for his emblem and motto a hand and pair of compasses, with 'Labore et constantia!'—'By labour and perseverance!' And by rigid adherence to this motto, he became rich and eminent: who indeed, let his station in life be what it may, can fail to improve it by acting in like manner? Juan de la Cuesta of Madrid, the printer and publisher of the first edition of Don Quixote, took for his device a stork, surrounded by the words, 'Post tenebras, spero lucem!'—'After the darkness, I expect light!' He was the intimate friend of Cervantes, and was well acquainted with all his struggles and difficulties, so that we, who now know how much sorrow and suffering made up the story of his life, ought to appreciate the touching appeal thus made to the heart of posterity. From his gloomy confinement in the narrow dungeon where he passed so long a period, through the jealousy of the litigious Mancheyans, this inimitable but persecuted man looked forward to a period when the light of fame should surround him. Nor was he mistaken. Some fame was his in life; but, as too often happens, it was not until the darkness of death had settled on his eyes that his great merit was fully acknowledged. Let us hope that the hopefulness so strongly expressed in his motto never deserted him, but that he felt the full force of the fine Spanish proverb that he puts, on the occasion of some disaster, into the mouth of Don Quixote, 'There is yet sunshine on the wall.'

From the mottoes of printers to those of men of letters the transition is easy. That adopted by the celebrated Erasmus, 'Festina lente!'—'Hasten slowly!' was considered by him to convey so much meaning, that he wished it might be carved in stone on public buildings, as well as printed in books. Less paradoxical is that used by an ingenious countryman of Erasmus, Tulp, or Tulpius, a physician of Rotterdam, who, besides being eminent in his profession, encouraged his fellow-citizens to resist the attacks of Louis Quatorze on their freedom. He took for his symbol a lamp burning, with the motto, 'Aliis inserviendo consumo!'—'I consume myself for the advantage of others!' And if, among the many occupations pursued by men of talent for the benefit of their fellow-men, there be one more self-sacrificing, more truly useful than another, it is that of the clever and conscientious practitioner of medicine—he who 'wounds to heal' when it is necessary, but who also knows how to administer the balm of sympathy to the worn and sinking sufferer.

The virtuous and learned Selden wrote in all his books, 'Freedom above everything!' Yet this freedom, so highly valued, was sacrificed by him to his still greater love of truth and consistency. During his illegal imprisonment by James I., being debarred the use of his books and papers, he declared that his mind had been undefiled by any wish to purchase liberty by a compromise of his opinions: in fact, he had the best freedom—that of the mind. Dr Robertson, the famous historian, commenced at fourteen to take notes of what he read, and he wrote in all the books so used for this purpose, 'Vita sine litteris mors!'—'Life without learning is death!'—and to the spirit of this motto he adhered throughout life. 'He devoted himself to study,' says Lord Brougham in his Lives of Men of Letters, 'examining and revolving the facts of history, contemplating ethical and theological truths, amusing his fancy with the strains of Greek and Roman poetry, or warming it at the fire of ancient eloquence, so congenial to his mind, at once argumentative and rhetorical.' To choose a motto so early in life, to retain it so long, and to act up to it with such persevering industry, seems to indicate a firmness and consistency of character worthy of imitation.

An amusing instance of the influence over Lord Eldon of a motto on the panels of a stage-coach, is related in Twiss's life of that eminent lawyer. When

he was plain John Scott, he went to London in search of fortune, in one of the stage-coaches known to our fathers, but of which our children will have no recollection: the motto on the doors of the vehicle was, 'Bis dat, qui cito dat!' on whose meaning, 'Twice done, if done quickly!' he ruminated all the journey. To everything that occurred, whether serious or ludicrous, he applied it; it remained fixed in his mind through life; and when he himself relates the anecdote, after having attained the highest honours of his profession, and realising a splendid fortune, he doubts, very characteristically, and very justly also, whether it would not have been wiser on his part to have more frequently made it the rule of his own conduct.

In closing the subject of mottoes, let us refer to that engraved on a sun-dial in the Jardin des Plantes at Paris: 'Horas non numero nisi serenas!'—'I count none but sunny hours!' the only course for a sun-dial, but neither the only nor the wisest one for man. They have little true knowledge who have never felt that the darkness which alternates with the daylight has benefits as great, if not as glorious—that the storm which sweeps over, and even threatens to destroy us, may, in fact, save us from unseen or specious danger. In the human heart, as in the bosom of the earth, there are seeds which can only germinate in the winter of adversity, which yet may have an after-growth of beauty and utility sufficient to repay the patience which has endured trustfully, and counted carefully, the dark and chilly hours.

ART OF MAKING MEN HAPPY.

There is an art in making a man happy which very few understand. It is not always by putting the hand in the pocket that we remove afflictions; there must be something more. There must be advice, and labour, and activity; we must bestir ourselves, leave our arm-chairs, throw off our slippers, and go abroad, if we would effectually serve our fellow-creatures. When to this active and effectual benevolence the more prompt efficacy of money is added, how great and how lasting may not the good be! Few, however, possess this quality of philanthropy; for it costs less to give a guinea than to give an hour.—*Five Nights of St Albans.*

THE OLD BACHELOR'S BRIDE.

LITTLE BESSY—pretty Bessy—vainly I have tried,
From 'midst the idle, fluttering throngs, to find a fitting bride;
And now a steady bachelor of two score years and one,
I'm almost in despair that I—must end my days alone;
So I will train a wife to suit my wishes, or I'll none!

Little Bessy—pretty Bessy—thou shalt be my wife
When fifteen years are added to thy present three years' life;
In modest, meek humility, a model for thy sex—
A temper cheerful, tranquil, kind, which nothing e'er can vex—
Refined and courtly bearing too, with learning quite complex!

Little Bessy—pretty Bessy—life is full of care,
And I must not expect to be exempted from my share;
But music hath the magic power of dissipating gloom,
And soft old songs you'll carol forth in our warm, cosy room,
Amid the perfumed wreathing clouds of my dear meerschaum's fume.

Little Bessy—pretty Bessy—thy white fingers trim
Must mould confections to the taste of epicurean whim;
No Berlin wool, no silken twist, with beads of gold or steel,
Shalt thou weave into mystic gems from many a shining reel;
No—rather would I list the hum of thrifty spinning-wheel.

Little Bessy—pretty Bessy—thou must stay at home;
All gossip parlance hating, nor ever wish to roam;
Simplicity's adornment thy attiring must display,
Avoiding all profusion, but moderately gay,
And ready always to be seen from dawn to close of day.

Little Bessy—pretty Bessy—sure I ask not much;
Although I own my private doubts—I shan't meet many such;
So, if you'll promise me to wed—a rich old man and kind,
And to his fallings and his age to be for ever blind—
I'll marry you in fifteen years—if then thou'rt to my mind!

THE SOCIAL INFLUENCE OF TEA.

BY LEITCH RITCHIE.

In a former paper, it was shown that the foundation of knowledge is simply Curiosity. I now venture, with perhaps a little more originality, to suggest that the moral reform and social improvement for which the present age is remarkable have had their basis in—TEA. The bulk of mankind, according to the testimony of all travellers, require something in the nature of a stimulant. Wherever this stimulant is tea, there is to be found, as will presently be shown, the spirit of civilisation in full activity. Where it is wanting, or used in small quantity, barbarous manners are still predominant. I therefore propound that tea and the discontinuance of barbarism are connected in the way of cause and effect.

The original country of tea had arrived, at the date when history began to be written in Europe, at a stage of refinement which was unknown in the west for many centuries after. When the wandering shepherds who migrated from the table-land of Thibet, or the slopes of the Himalaya, or, as other writers will have it, from the Tartarian mountains of the north-east, reached the banks of the great Chinese rivers, they were engaged for a certain time in the slow struggles of barbarism. Even the luxury to which they were gradually led by wealth and ease had something savage in its character. One of their early princes, for instance (who flourished at some trifling distance of time from the Mosaic deluge), giving a great banquet, set his guests to swim in a tank of rice wine, with the meats arranged within reach round the brink. But the great agent of refinement was in the midst of them, though unknown and unheeded at the time; and as the uses of the tea-plant were discovered, and its civilising juice disseminated throughout the land, the Chinese, from some hordes of barbarians, became a great and polished nation. This revolution, be it observed, did not take place, as at a later period in Europe, through the collision of races. The Chinese were shut up, with their tea, between the desert and the ocean; and when visited at the end of many centuries by Europeans, who crossed the deep, or penetrated through a cordon of savage nations for the purpose, they were found to possess the political and social institutions, the manners, and even the frivolities peculiar to civilised life.

Tea is suggestive of a thousand wants, from which spring the decencies and luxuries of society. The savage may drink water out of his calabash till doomsday; but give him tea, and he straightway exercises his faculties in the invention of a cup worthy of such a beverage. Tea was thus the inventor, I have little doubt, of that rich porcelain called china, from which arose numberless ideas of elegance in form, and beauty

in colouring. A single piece, before it is finished, employs forty hands, from the pounder of the flint (usually a blind or lame person), who earns half-a-crown a-month, up to the artist who sketches the design, while another fills in the colouring.

Is it going too far to inquire whether tea may not have borne an important part in the formation of that gentleness and tractability of character which keeps the Chinese calm and orderly even in the midst of political revolutions? Leave them alone to their ceaseless industry, to present offerings to the manes of their grandfathers, to read and write ever new romances, and they care not a straw what dynasty occupies the throne. Why, then, do we find any vestiges at all of barbarism among the Chinese, the very meanest of whom are educated, and may rise to the highest dignity of a subject? Because the poor have no tea. Tea is cheap in China, but still beyond the reach of the lowest classes, who have recourse to decoctions of all sorts of plants, which spoil the taste of the water, without adding to its virtue. Another reason is, that rice wine (if it should not rather be called rice beer), although a very weak beverage, is frequently drunk in such quantities as to intoxicate, and that, in the northern parts of the country more especially, the consumption of spirits and opium is very considerable. Opium-smoking, however, is by no means an imported vice, as it is commonly imagined to be. The English found the people besotted with the drug, which whitened the fields of the richest departments of the country; and they supplied their craving, just as they would have done had its object been cottons or woollens. In order to accomplish this, they were guilty of the political crime (for commerce may be said to have no moral sense) of leaguering themselves with the masses and the functionaries against the autocratical government of Peking, whose powerless edicts had been fulminated against the native cultivation of the poppy, when as yet the 'demons' of Europe had hardly entered the field.

The Japanese are perhaps still greater tea-drinkers than the Chinese; and they afford a more striking instance than the latter of the union of this custom with a high state of refinement and politeness. The first absolute emperor of Japan is said to have been a Chinese warrior, who commenced his reign in the year 640 B. C.—just thirty years after the invention of porcelain in China. Before the middle of the seventeenth century of our era, disgusted with the religious quarrels of the Dutch and Portuguese, and annoyed by the eager selfishness of the traders of various other nations, the Japanese grew tired of the world, and sealed themselves up hermitically in their own islands, where a population, as some say, of 45,000,000 remain to this day in a state of utter isolation. But luckily the tea-plant continued, and continues, to flourish among them; and

they permit a farther supply of the manufactured article from China. The Japanese are therefore polite and refined recluses. Every individual among them is taught reading, writing, and the history of his own country; but all beyond the lowest classes go through a regular educational curriculum for many years. The girls, in addition to literary instruction, are taught needlework, useful and ornamental, and the discharge of household duties. Morning calls and dinners are as common as in Europe, but more especially grand tea-drinkings, at which the matrons amuse themselves with ornamental work, and the others with singing and dancing. 'Chess and draughts,' says a recent work, 'are the sedentary games; but when forfeits are introduced, the polite, dignified, and gorgeously-dressed company throw ceremony out of the window, become rank philosophers on a sudden, and play with might and main like so many boys and girls.*' There is no country in the world where tea leads more directly than in Japan to the study of the comforts and elegancies of society. The exhibition of porcelain and lacquered ware is magnificent; but in the ornaments—or rather the ornament—of the room, there are displayed a taste and refinement that are absolutely unique. There can hardly be said to be anything we would call furniture, the carpet serving for chair, table, sofa, and bed, in one. Neither are there jars, statuettes, or nicknacks suitable for an old curiosity-shop; but in a recess, at one end of the drawing-room, stands a single picture, with a vase of flowers before it; and this picture being always changed to suit the peculiar occasion, addresses itself in a direct manner to the hearts and imaginations of the guests. Rural parties and water excursions are another grand resource of the polite hermits. 'The rivers, the lakes, the innumerable bays of the coast, are thronged with gilded barges, which lie mute and motionless under some shady bank during the heat of the day, but when the bland evening comes, shoot like stars through the water, tracked by many-coloured lanterns, and the silvery laugh and buoyant songs of women.' In a state of society like this, it need hardly be mentioned that the theatre is a principal source of amusement; although there the ladies are themselves the principal performers, being accompanied to the boxes by their attendants loaded with dresses, the effect of which they pass their time in trying upon the audience.

It is only necessary to add, that the Japanese are fond of poetry, and that tea-drinking gives rise there, as elsewhere, to abundance of love-making. The following verses, extracted from the book referred to, but coming to us through the medium of a Dutch translation, would pass very well in an English annual. They are supposed to proceed from a young lady who has set her heart upon an inferior in station—for there is nothing more dreaded, or more dreadful, in Japan, than a *mésalliance* :—

'To hear thy deep but gentle voice,
Thy calm and radiant brow to see,
Oh how it would my heart rejoice!
But that is too much bliss for me.

One look of thine, by others known
To thrill me to my bosom's core—
One word not heard by me alone,
And I were lost for evermore !'

Tea has not as yet made much impression upon the Tartars; and the reason may be, that it is only the coarser part of the leaves that falls to their share. This is beaten up, and moulded into what are called

bricks, and in this form sent into the desert. When the Tartars, however, come into China, and drink fine tea out of porcelain cups, they lose their distinctive character in a very short time, and behave as if to the manner born. So far from conquering China, as is commonly supposed, they yielded to its tea. They annexed their vast territory to the empire, and while nominally reigning, submitted to the government, laws, and customs of the country—in fact, became Chinese.

The fine tea of China passes through the Mongolian desert, and is delivered to the Russians at the southern frontier of Siberia. Here a couple of posts mark the boundaries of the two great empires, with the little town of Kiahkta on the Russian side, and that of Maimai-tchin on the Chinese. The tea travels through the whole breadth of Siberia, and at length arriving in Europe, is distributed at the fair of Nishni. This lengthened land transit adds so heavily to the price, that only the wealthy in Russia can afford to drink it. The article is not to be seen on any respectable table at a less cost than half-a-guinea a pound, and I have myself partaken of tea in Moscow which cost twice that sum. The consequence is, that only the noble and mercantile class drink it, while the peasants, or great body of the people, flood themselves with the abominable small-beer called quass, or brutalise themselves with votki, the Russian gin. Tea civilises, so far as it goes, the mercantile class; but hemmed in as they are by the nobles on one side, and the serfs on the other (for all three are castes as inexorable as those of India), they cannot be expected to receive its full benefit. Still, the merchants are an amiable, good-natured tribe, and their wives and daughters are decidedly ladylike, and dressed in magnificent silks and satins. They have a great value for tea, and pride themselves on its quality. I remember having the pleasure of falling in once with a Russian merchant—a princely-looking fellow, in his fine beard and flowing kaftan—who scorned the tea we met with at the roadside inns, and invariably made use of his own private store, sharing it liberally with his fellow-travellers. As for the nobles, they drink so copiously of other beverages, that it is hard to distinguish the effect of tea upon them. The quantity of French champagne they consume is almost incredible, although they have an excellent champagne of their own, made in the Caucasian provinces, at little more than a third of the price.

In another direction the tea of China finds its way into the empire of Annam, Siam, and the adjacent countries. The Cochinchinese have already begun to shake off their Oriental apathy, and purchase steam-vessels; but as yet the farther races have only received the civilising beverage concentrated in the form of lozenges, which they melt into tea. Indeed, in some parts of the Burman empire, the animals use it as a kind of pickle preserved in oil; just as in the Highlands at home, it was at first looked upon as a culinary vegetable, and presented at table in the form of greens. Tea has hitherto done little or nothing for the neighbouring Archipelago; but in Australia beyond, its operation is distinctly visible. In a former paper, I described the dreadful state of intemperance in which our settlements in that valuable country grew up, and which was in a great degree attributable to the monstrous practice of government paying its labourers in spirits. Since this was discontinued, and tea introduced in greater quantities, a remarkable change has taken place. The cheap luxury (for it is not burdened with the duties it bears at home) carries comfort and refinement into places which

* The British World in the East.

before were distinguished only for the squalor and brutality of drunkenness. In the bush, it is of course vain to look for the elegancies of the tea-table; but it is something even to find the lonely stock-keeper, instead of drowning the sense of his hardships in intoxication, infusing his enlivening tea in a kettle, and drinking it out of a quart-pot. That temperance still prevails to a considerable extent, cannot be denied; but the crisis, thank God, is past, and the reign of tea has fairly commenced.

Passing over the attempts made to naturalise the tea-plant in Java, British Malacca, and Brazil, and to turn to account the wild plants of the kind found in Assam and other parts of India, more especially the British provinces in the north-west, I may now come to the introduction of the magical beverage into Europe, and its result.

Tea was hardly known at all in this country till after the middle of the seventeenth century. We at first received it in trifling quantities, through the medium of the Dutch East India Company; and it seems to have been chased commercially with intoxicating drinks, a duty of eightpence per gallon being imposed on the decoction. In 1689, this mode of rating was discontinued, and a duty of five shillings per pound charged on the leaves. In 1711, the quantity returned for home consumption in Great Britain was 142,000 pounds; in 1786, it was 14,000,000 pounds; and before the end of the century, it had reached 20,000,000. At present, we require an annual supply averaging 35,000,000 pounds. Russia consumes about 9,000,000 pounds; Holland 3,000,000 pounds; Germany 2,000,000; and the United States 16,000,000 pounds a-year.* The consumption of France and Italy is not worth mentioning: so that Great Britain drinks considerably more tea than all the rest of the western hemisphere together.

It would not be easy to trace, in a direct manner, the operation of this new agent in civilisation; for tea does its spiriting gently. It is no vulgar conjurer, whose aim it is to make people stare. It insinuates itself into the mind, stimulates the imagination, disarms the thoughts of their coarseness, and brings up dancing to the surface a thousand beautiful and enlivening ideas. It is a bond of family love; it is the ally of woman in the work of refinement; it throws down the conventional barrier between the two sexes, taming the rude strength of the one, and ennobling the graceful weakness of the other. At the dinner-table, there is something repulsive in the idea that we are met for the purpose of satisfying the animal necessities of our nature; and our attempts to gild over this awkwardness by a gorgeous display of plate, crystal, and porcelain, only serve to superinduce an air of stiffness and formality. At the tea-table, on the other hand, although one may likewise eat, he does so without the gross sensation of hunger, while he who has no appetite at all, is spared the smell of smoking viands. In drinking, his excitement is seen, not in the flushed face, extravagant laugh, and confused ratiocination, but in an unconscious buoyancy of spirits, a rapid but clear flow of ideas, and a kindness, amounting to warmth of regard, for all around him.

Tea, however, philosophically considered, is merely a rival of alcohol. The desire for an agreeable and exhilarating drink is natural to man, for it exists in all states of society; and the new beverage, gratifying the taste, as it does, without injuring the health or maddening the brain, must be considered a blessing to the human race. We are apt to look with disgust at such statistics as I have ventured to introduce, though sparingly, into this article; but if we consider the moral consequences attending the consumption of a few additional million pounds of tea, the arithmetical figures will be invested with more than romantic interest.

A story is told of our gigantic neighbour, the western metropolis of Scotland, which illustrates amusingly, and with but little exaggeration, the state of manners in that city within the recollection of us middle-aged men. An Edinburgh gentleman, then young, and not yet sixty, being at dinner with a merchant of Glasgow, and finding the company inclined to sit longer over their wine than he liked, rose from table without ceremony, and made his way up stairs to the drawing-room, to take a cup of tea with his hostess. The large and elegant room was almost dark, for only a single candle burned on the table, and Mrs. — was alone, and sat cowering over the fire. When the visitor entered, the lady started up in some alarm, and rang the bell. Presently recognising the intruder, she apologised, by telling him that he was the first person during her married life, now of some years' duration, who had entered her drawing-room after dinner!

Glasgow, I need hardly say, is now in this respect like other places; and, in fact, the change in the manners of the country at large is quite as striking. The gentlemen never fail to take tea, and for that reason they never fail to enter the drawing-room in a state of gentlemanly sobriety. I may be told that it is not the tea that has effected this, but that other influences have driven them to tea. Be it so. But I must still be permitted to think it odd that such influences should *always* exist in connection with tea, and that tea throughout the world should be found to accompany civilisation. I have a strong notion that the atrocities of the French Revolution were owing to the want of tea; and likewise that the kennels of Paris, during the three famous days of July, ran wine as well as blood. The Italian states would at this moment be greatly the better of settling their new constitutions over a cup of tea; and by the aid of the same elixir, Austria would be sure to see at once the absurdity of her pretensions. A few million pounds of tea thrown into Switzerland (and paid for by the sale of the arms and ammunition of the belligerents), would greatly facilitate the work of mediation. In Germany, I would recommend the Protestants and Catholics to empty their filthy beer casks into the Rhine, and hold a general tea-drinking for the settlement of their disputes.

But if Great Britain is so large a consumer of tea, why do crime and ignorance still prevail among the body of the people? Because the poorer classes still drink bad tea, imitation tea, or no tea at all. The tea that is sold in bond at tennepence pays a duty of *two shillings and a penny*, while the tea which is sold in bond at several shillings pays no more. Thus the poor are charged at least three times more, according to value, than the rich. This fact would be almost incredible; but the duty on paper presents quite as wild an anomaly. The publishers of an expensive book, with a circulation of 500 or 750 copies, pay a few halfpence of duty on the paper per copy, while the publishers of a cheap publication, which could only exist through a circulation of scores of thousands, are mulcted by government in the greater part of their entire profits! The consequence as regards tea is, that the consumption, though immense, is really restricted, as is proved by the great quantities of adulterated or imitative tea constantly in the market; that the horrible massacres perpetrated by the English in China, for the sake of trade, have been in vain, since tea is the only Chinese staple capable of unlimited extension; and that an almost insurmountable obstacle is opposed to the complete triumph of temperance at home, by the virtual denial of the genuine beverage to those classes which most require its civilising influence. With regard to paper, the duty has little or no effect upon expensive publications, but it closes in a great measure the door of legitimate speculation against those who, in pursuing business, would fain strive to enlighten the masses of their fellow-countrymen; while it induces persons of an opposite character to pander to vice and folly, in order to secure that enormous circulation without which a cheap

* This was a few years ago; but the republic having had the wisdom to abolish the heavy tax on tea, the consumption is probably much increased.

publication could not exist. There is a connection between the two subjects which I would fain enter upon, if I had left myself room; but any one may see that tea and literature are the two great agents of civilisation, and that it is the duty of all good citizens to insist upon the free circulation of both.

GENEVÈVE GALLIOT.

THE name of Louis Stanislaus de Bourbon, Prince de Lamballe, is familiar to our ears as a household word, in consequence of the untimely end of his beautiful and noble-minded widow, who was one of the earliest victims of revolutionary fury in France; but the personal history of the prince is comparatively unknown, although some of its details are so romantic, as to merit at least a share of our passing interest. He was the only son of the Duke de Penthièvre, a nobleman whose rare and distinguished virtues made him worthy of the illustrious name he bore, and whose blood now flows in the veins of the royal family of France, through the union of his only daughter with that Duke of Orleans who, at a later period, became so painfully conspicuous in the annals of his country.

The Duke de Penthièvre, during the greater part of his life, was united in the closest bonds of friendship with a lady, who, by her kindred qualities, fully merited the esteem of so excellent a man; nor was the Marquise de Créquy (the lady alluded to) less beloved by the duke's children, both of whom were wont occasionally to address her by the name of mother. It is from her pen that we gather the following details of the Prince de Lamballe's early love and its unhappy results. She tells us in her memoirs, that the artist Greuze having brought her some of his paintings to look at, she observed amongst them the portrait of a young girl, whose beauty was so naïve, and yet of so elevated a cast, that she desired to purchase it for her oratory, as a type of ascetic loveliness. Greuze, however, declined selling it to her, and excused himself by saying that it belonged to an eminent individual, for whom it had been expressly done, so that it was no longer his property; but the Duke de Penthièvre happening to enter at the moment, intreated the artist with such persevering courtesy to make a copy of the painting for him, that before a fortnight had elapsed, this angelic image was placed in Madame de Créquy's apartment, as a *cadeau* from her friend. Before fixing it in her oratory, she resolved to leave it for a while in her saloon, that others might share in the admiration with which she viewed this beautiful portrait.

'Two or three days afterwards,' she writes, 'I was reading in my oratory, when a visitor was announced, whom I understood to be the Marquis de Pombal. After a few minutes' delay, I entered my saloon, and found there, not the Portuguese ambassador, but the Prince de Lamballe, who was standing before my cherished picture, upon which he gazed with so strange an expression.

"Dear mamma, who gave you this portrait? How does it happen to be here?"

"It was given to me by the Duke de Penthièvre, monseigneur."

"By my father! Is it my father?" and in another moment he fell senseless at my feet.

'His swoon terminated in a violent hæmorrhage, which left him in a state of utter exhaustion. As he wished to pass the remainder of the day with me, I refused admittance to all other visitors, and did my best to comfort and reassure him. Poor young man! I loved him as if he were my own son. In the course of the evening, he confided to me the following details:—

"You know that my childhood and early youth were chiefly spent at my father's château d'Armst, whose neighbourhood was full of charms for me, because of the boyish freedom I enjoyed there. Many a time I escaped from my tutor, and wandered alone through our wide Vexin foresta. There I would sit dreaming away my mid-day hours on the banks of some shady rivulet, or go and eat brown bread and milk with the dwellers in some lonely cottage. Or perhaps I would follow to the grave a

peasant's funeral cortège, or go and say my evening prayers with the hermit of Chesnaye.

"One day I overheard my father saying to the Abbé de Florian, 'Let him alone, and do not torment him, or else he may perhaps go so far away that we shall not know where to find him. He seems impelled by a spirit of restlessness, which he does not know how to repress; but he never makes a bad use of his liberty—so watch him, my dear abbé, but do not, I pray you, punish him.'

"I was about twelve or thirteen when these words of my father met my ear, and they were uttered in that tender and affectionate tone with which you are so well acquainted. I was smitten with sorrow for having disquieted so good a father; my rambles became less frequent; and I never indulged my passion for freedom, without lamenting it afterwards as a sort of lesser crime towards him.

"On my way home one summer's evening from an excursion of this kind, I paused a while on the summit of a craggy rock, just outside the bounds of our park, to gaze at the setting sun. At the same moment there passed close to me a charming little girl, who was leading along a goat. She was not strong enough to control its movements, and yet would not relinquish her hold of the rope, by which she was endeavouring to guide it; so that the animal dragged her among the rocks, where she fell down bruised and wounded. I ran to her assistance, and wiped her bleeding forehead with my handkerchief; but even in the midst of her tears, she smiled sweetly upon me, and assured me with the most silvery voice that it was nothing—nothing at all. I insisted on leading the stubborn goat home, and the rope breaking, I untied my scarf, fringed with gold, and fastening it around the creature's neck, was bearing off my prize in triumph, when I met my father on horseback with a numerous retinue. At first I felt confused at the rencontre, but told him simply all that had passed. My father desired one of his gentlemen to accompany me. 'I will not scold you to-day,' said he smiling. 'Monsieur de Fenelon was far your superior, and I have seen him, in his episcopal habit, driving home a cow which had escaped from the stable of a poor widow. Go! my son.'

"The little girl had stood timidly at a distance all this while, so that she heard not a word of our conversation. The mother of Geneviève Galliot was suffering from a pulmonary complaint. Poor young woman!... She was the widow of a carter on one of our farms, and her husband had been gored to death by a bull. He was spoken of among his neighbours as a worthy good fellow, and one of the finest young men in the principality. The widow of Remy Galliot had no earthly possessions save her cottage, a small garden stocked with fruit-trees, some hives, and an acre of land sown with barley and rye. She would have gained a livelihood for herself and her daughter with her distaff, but that her illness incapacitated her from working... Pardon all these little details concerning Geneviève's family, and do not be surprised, dear madame, at my dwelling on them. The merest trifles, you know, become important when they concern those we love.

"I told Baudesson, our gentleman, that I was weary, and that if he would go and order my carriage, I would meet him at the end of the lane leading to Fresnoy—so was the little hamlet called wherein stood the Widow Galliot's cottage. As soon as Baudesson was gone, I presented to Geneviève's mother the only louis-d'or I had about me, telling her (from an instinct of respectful love to her daughter) that my own mother had sent it to her, and that she would take care she should want for nothing during her illness. After invoking many blessings on our heads, she inquired who was my mother. This simple question filled me with perplexity. I felt that the answer to it might raise an insuperable barrier between these poor people and me; so I replied, with some embarrassment, that my mother's name was Madène, whereon the invalid rejoined languidly, 'There are so many gentlefolk in these parts whom we know nothing about!' The young girl thanked me with an expression of grateful friendliness that filled me with joy.

"Geneviève Galliot came daily, as was her wont, to the Thymale rocks in quest of pasturage for her goat; and a day rarely passed throughout the summer without my meeting her there. We used to make rustic bowers among the interwoven branches of the trees, and would weave garlands of wild flowers, or pluck nosegays of them for each other. One day, while giving Geneviève money for her mother, I told her that her present should be a gold cross.

'With a silver heart!' inquired she in a tone of innocent delight.

'With a gold heart like the cross! . . . I love thee so much, my Geneviève, that I would gladly give thee all I have, or ever hope to have!'

'And so would I too, Monsieur Louis. . . . But I have nothing to offer you,' continued she, with an air of sadness, and yet of gentle, trustful resignation.

'I remember one day her bringing me a bunch of pale-yellow primroses, which she had gathered in the hedges for me. I have always preserved this nosegay: it is in a casket where I keep all that is most precious to me—a prayer written by St Louis; a letter of our ancestor's, Henry IV.; a relic of the true cross; a pearl bracelet of my mother's, with her picture; and the primroses of my poor little friend, my first friend, my sweet Geneviève!

"One day towards the end of October she did not come to the rocks, where I waited in vain for her till evening. I returned home in a state of feverish excitement, undressed myself as usual, and let my two *valets-de-garde* retire, under the impression that I was going to bed. It was ten o'clock; my parents were absent at Rambouillet; my governor playing at trictrac in a distant apartment with the Abbé Florian; so that I resolved to open my window, and to escape out of it in quest of Geneviève. This was speedily accomplished, and in a few minutes I found myself beyond the limits of the park, and bounding over the Thymale rocks like a young roe. I soon found myself close to the low hedge which separated the Widow Galliot's garden from the road. I stood there about half an hour, with my eyes fixed upon the door of the cottage. I did not dare to approach it; but I knew that she was there—that I was near her; and the painful, troubled feelings that had oppressed me, were stilled: and truly I had need of this inward repose, for the heart of a man had beat within my boyish breast, and its power was too mighty for my frame. . . . It seemed as if nothing more were wanting to my happiness than to watch there until the morning, when she assuredly would come forth and relieve my anxiety.

"After a while, however, the door was opened, and an aged woman, holding in her hand a small lamp, came out. She approached the hedge, cut off the slender twig from a tree close to which I was standing, and returned to the house. Some strange indefinite fear took possession of my soul. I followed her into the cottage. Geneviève was kneeling by the bedside of her mother, to whom the old curate of Rouvres was administering extreme unction. I knelt down by her side, but she seemed scarcely sensible of my presence. Her eyes were mournfully fixed upon her dying mother. The good old priest began the prayers for the dying, and while he was pronouncing the last solemn absolution, the spirit fled from its earthly tenement.

'Depart Christian soul! return to thy Creator,' were the old man's closing words; to which I responded a hearty amen! The curate, who had not before observed me, turned his head and exclaimed, 'Is it you, monsieur!'

'Yes, good sir, it is I; and pressing his hand cordially, I begged of him not to leave Geneviève in this house of mourning, but to take her home with him, and that I would pay all her expenses.

"This charitable pastor at once accepted the charge, adding, however, that he would accept of no remuneration for his care of the orphan; thanking me the while for having suggested to him a duty, which otherwise he might not have thought of fulfilling.

"Geneviève smiled gratefully upon me in the midst of

her tears. She did not seem either surprised or pleased on hearing of my high rank: she had always known me to be a gentleman, and my title of prince did not appear a whit more exalted in her eyes.

"She was so anxious to remain near her mother's body, that there was some difficulty in prevailing on her to leave the cottage; but I expressed my desire for her removal with so much gravity and decision, that she yielded the point at once; looking at me, however, with an air of astonishment, as if struck by the difference in my tone and manner from what she had previously been accustomed to. A revolution had, in fact, taken place in my existence: I had the charge of Geneviève, and although only fifteen years old, I was become a man; one who must exercise his own will, and form his own plans; and from that moment I have never had a single childish thought.

"The curate being obliged to visit a sick person at the other end of his parish, Geneviève departed under the care of the old woman, and I was left alone with the pale and lifeless body of her mother. I attempted to pray, but another sacred duty seemed present to me. I knelt by the bedside, and addressing the remains of Susan Galliot, I swore to respect and to watch over her child. 'I will marry her. Yes! Geneviève Galliot shall be my wife. I swear it in the presence of Him who is your judge and mine.' So saying, I imprinted a filial kiss on the cold hand of the deceased. . . . And I have kept my word to thee, Susan Galliot; for thy daughter's husband is Louis de Bourbon, Prince de Lamballe and Co-rentin. Nor do I repent of my choice, for I love all things in my Geneviève, even the inferiority of her birth. All that concerns her family is become dear to me for her sake: you may imagine how dear, when I tell you that I have even removed the ashes of her parents from their humble burial-place, and interred them in the church of Dreux, between the mausoleum of the Duchess Diana and the cenotaph of Henry II. You may infer from thence, madame, how I love and honour my own inestimable Geneviève."

"M. de Lamballe had expected happiness, but he did not find it. It is almost needless to say that his marriage had been a private one. He knew that it would be impossible to gain his father's consent to so unequal an alliance, therefore he resolved to keep his union with Geneviève a profound secret, being painfully anxious not to wound the feelings of so beloved and revered a parent. The lovely Geneviève could not be established in Paris without attracting some degree of public attention, so it was decided that she should live in the country. Accordingly, her husband had purchased a charming little residence near Clamont sous Meudon, not far from his father's château at Susaux Penthievre, where he contrived to spend as much of his time as possible.

"Madame de Saint Paër (this was the name bestowed on Geneviève, being derived from a fief of the principality of Lamballe)—Madame de Saint Paër began by believing herself happy; and if the fondest love could have secured happiness to her, then she would have been blest indeed. But however poets or romancers may extol the sweetness of stolen pleasures, yet, to a well-constituted mind, they involve more or less the consciousness of guilt, and consequently of fear and disappointment.

"The prince was obliged, by the duties of his station, to pass much of his time in Paris, and occasionally his visits to Madame de Saint Paër could not be prolonged beyond a few brief minutes. In those days the country posts were irregular and slow in their progress; and among the whole bevy of livery servants at the Hôtel de Penthievre, there was but one to whom the prince could intrust a letter for his wife. By way of avoiding any unfavourable suspicions concerning his beloved Geneviève, he confided to this man the secret of their union, and also to his brother, who was valet-de-chambre to Madame de Saint Paër. If this confidence was imprudent, it at least indicated a generous and noble heart, willing rather to incur a risk than to injure an innocent and helpless being.

"The gentle Geneviève now found herself too often a solitary being, and many a tedious day passed without

her seeing or hearing from her beloved. Disquietude soon succeeded to ennui. A noble and handsome young man!—an irritated father!—a powerful and perhaps vindictive family! What might she not anticipate! . . . Tempting offers for him; severities for her; and then desertion—forgetfulness! . . . Yes; these were the images which continually floated across her mind, until her life became a prey to tears and melancholy. The prince, during his visits, endeavoured to reassure and console her; but all in vain. Then he grew impatient at her suspicions; and his irritability added tenfold to the burden of her misery. He would occasionally come and pour out in my ear the tale of his sorrows and his difficulties.

"Suffer, and be patient," was my advice; "for never are we allowed to despise the obligations and duties of our position with impunity; that is for you, my dear prince; and as for Geneviève, innocent creature, whom you have made me love without knowing her, she too, alas! must suffer, for it is impossible to occupy a false position without disquietude and trouble. But I beseech you to remember that it is you who have brought her into this state of perplexity; for if you had truly loved, you would have carefully avoided her, instead of making her the unfortunate offer of your hand and heart. The fact is, that you are a man, a true man; so you thought of yourself alone, my prince: you believed yourself a generous lover when you married a country girl, whereas you committed only an act of egotism. But do not add to your error by being unjust to her who is the victim of it. I pray you to bear with her fears and complaints, remembering that she is a tender, lonely woman, and has no other earthly stay or counsellor but yourself."

About this time it happened, unfortunately, that the Prince de Lamballe, who had for a long while been estranged from his brother-in-law, the Duke of Orleans, was induced to become reconciled to him, and in an evil hour was prevailed upon to share in the Orleans revelries at Mousseux, from whence he was carried home in a state of insensibility, which was followed by so severe an illness, that the Duke de Penthièvre became alarmed for his safety, and came to communicate to me his fears and anxieties. He told me that his son seemed overwhelmed with melancholy, and was continually inquiring for his favourite valet, Champagne, who, like himself, was in a most deplorable state since his return from the banquet at Mousseux, whither he had attended his master, and where, it would appear, they had both partaken of drugged potations. The Duke de Penthièvre added, that his son had received several letters stamped with the post-mark of Suaux, and that the perusal of them seemed greatly to increase his feverish agitation.

"It was very painful to me not to respond to the confidence thus placed in me by my excellent friend; but my lips were sealed by the promise of secrecy imposed on me by his son; so I could only assure him of my truest sympathy, and promise that I would go and visit the young prince on the following day.

"On entering his apartment at the Hôtel de Penthièvre, I found him consumed by the most gloomy sadness. He was too ill to go to Clamont; and Madame de Saint Paër, not having seen him for a fortnight, had written to him in a delirium of jealous agony, saying that she could no longer endure the torments of suspense, and that she would, without delay, come and see him at the Hôtel de Penthièvre! . . . He had replied with severity—"Madame, I command you not to come here. My honour is concerned in the matter!"

"Ah! what have you done?" cried I. "You are wonderfully careful of your princely honour. But poor Madame de Saint Paër!—methinks you might consider her a little. . . . And what fearful surmises must your conduct excite in her mind!"

"At this moment we were interrupted by the entrance of the Duchess of Bourbon, and soon afterwards I returned home, oppressed by the forebodings of coming woe.

"Two days afterwards, the Duke de Penthièvre wrote to tell me that he could not call at my hotel, because the state of his son's health required his unceasing watchfulness. The prince had, during the preceding day, suffered

from brain fever, and he was then lying in a lethargic stupor, which alarmed his medical attendants. The duke ended by saying that his door was closed to every one but his daughter and myself. I had scarcely finished reading his note, when the trusty Dupont entered my saloon, telling me, with a disturbed look, that there was in the antechamber an elder brother of Champagne (the Prince de Lamballe's confidential valet), who earnestly desired to see me for a moment on a matter of life or death!

"It was the valet-de-chambre of Madame de Saint Paër, who, bursting into tears, told me that his mistress was poisoned—that he had vainly endeavoured to see the prince—and that, knowing I was his intimate friend, he thought it best to seek an interview with me. . . . "You have done right," said I to him; and sending off instantly for my surgeon Baudret, before another hour had elapsed, we were at Clamont, by the bedside of Geneviève. Her femme-de-chambre having almost lost her senses from fright, had called in the whole village to her mistress' aid, so that the apartment was filled with a crowd of idle lookers-on. They were a little abashed at my presence, but could not be induced to leave me alone with Madame de Saint Paër, until my servants imposed silence by telling them that I was the Marquise de Créquy, whereupon they submissively retired.

"Ah, madame, is it you! . . . What excessive goodness! . . . Ah, madame!"—and these were the only words to which the lovely Geneviève could give utterance—she whose days I would gladly have prolonged at the expense of my own! . . . Alas! it was too late; for the poison was doing its deadly work so effectually, that Baudret told me she could not live beyond seven or eight hours longer, and that her present convulsive state would speedily be followed by one of languid torpor.

"With earnest cries she called for her confessor, the Vicar of Suaux; but he could not be found. . . . "Your husband," said I to her, "has great confidence in one of the priests of this parish."

"My husband!" she cried out with a bewildered look. . . . "You know, then, that he is my husband! He told you. . . . Ah, pardon me, merciful God! pardon my crime! . . . Ah, if I could only have known that he had acknowledged me. . . . And I have doubted thy goodness, gracious Lord! Oh, pardon my blindness—my want of trustfulness in Thee!" Then turning round to me—"Alas, madame, can you not get me cured? Or at least do not, I beseech you, let my poor body be buried on the highway! Every one knows I have taken poison. Alas! alas!"

"My poor child," I replied, "do not let your thoughts dwell on such a painful idea. But rather repent of the great sin, the crime you have committed, and leave the rest in God's hand."

"And monseigneur! . . . my husband?"

"He is as ill as you are."

"Ah," said she with a faint gleam of joy upon her pallid countenance—"ah, then, we may soon meet one another again. . . . Look at these, madame," continued she, presenting to me two letters which had been concealed beneath her pillow; "read them, and judge of my misery."

"These infamous letters bore the Parisian post-mark, and their contents curdled my blood with horror and indignation. The writer, while addressing "the adorable Madame de Saint Paër" in the most adulatory strain, hinted that a certain young prince, in whom she was deeply interested, was pursuing a most unworthy career; and that she must prepare herself for a speedy rupture with him, as he was about to form an alliance with one of the princesses of the royal family. Too well I could guess the quarter from whence this tale of calumny had sprung; but Geneviève, ignorant of the world and its wicked devices, almost a child in years, passionately attached to her husband, and left alone without friend or counsellor, had been crushed by the weight of miserable thoughts which beset her; and on receiving the prince's severe letter (already alluded to), her reason gave way, and she swallowed the deadly draught which was now consuming her vital powers.

"The vicar of Suaux arrived; and on my preparing to quit the room, Geneviève besought me not to abandon her. "Stay, madame, I beseech you! Leave me not to die alone! You may hear my confession."

"I must leave you for a while, my poor child; but you may depend on my speedy return, and I hope not to come alone."

"Geneviève! Geneviève! do you not hear my voice? (This was after an hour and a-half's absence, and the patient, just after receiving absolution, had sunk into a narcotic stupor.) Here is the Duke de Penthièvre. He is come to Clamont to see the wife of his beloved and only son."

"Wife!" she articulated almost inaudibly. "His wife!"

"Perceiving that she was not yet insensible, and wishing to impart a consolation which, even at that moment, would, I knew, be precious to her, "It is the Duke de Penthièvre," repeated I in her ear. "He is by your side."

"She opened her eyes with difficulty, and her languid glance resting on the order set in brilliants which sparkled on the duke's breast, she smiled with ineffable sweetness, saying, "How have I—deserved! Pardon me, monseigneur—your son!"

"These were the last words breathed by the expiring Geneviève."

"My son had chosen you for his wife in the presence of God! you have received the blessing of our universal Father—of our Father in heaven; and now I am come to bless you, and to pray with you, my daughter!"

"Before his prayer was ended, she had yielded up her spirit; and there she lay, with an aspect of such pure and lovely serenity, that it seemed as if joy, rather than sorrow, had hovered over her departing moments."

"Geneviève Galliot is inhumed in the vaults of the collegiate church of Dreux, by the side of Marie Thérèse Félicie d'Est de Modène, the mother of her beloved husband. I never go to Montfaucon* without stopping at Dreux to offer up within the church of St Stephen a prayer on her behalf."

"M. de Lamballe had a long and serious illness, from whence he came forth purified as gold from the heated furnace; and amid his deep affliction he appeared calm and resigned."

"Two years later, he was induced to marry Mademoiselle de Savoie-Carignan. Inauspicious marriage! Never shall I forget his pallid countenance in the chapel of the Hôtel de Toulouse, where he was surrounded by brilliant lights, and fragrant flowers, and glowing draperies; while his young and beautiful bride looked dismayed at the mournful aspect of her betrothed. He scarcely looked more deathlike after his decease, which occurred within a brief period after his second marriage."

"The Princess de Lamballe was beauty, amiability, and virtue personified; but her fate in marriage was by no means a happy one; and it need not be told here how fearfully tragic was her end."

THE NEW SANITARY COMMISSION.

If an excuse were required for recurring once more to the sanitary question, it might be found in the fact, that society is too apt to be forgetful of matters even of vital importance, when not brought repeatedly under notice. To some readers the subject will have become wearisome, if not repulsive; but as there appears now to be a real desire to go to work in earnest upon remedial measures, we can do no less on our part than direct attention to them.

The new Commission appointed by her majesty in September last have just published their first Report. It relates exclusively to London, their duty being 'to inquire whether any, and what several means may be requisite for the improvement of the health of the Metropolis;' and they have pushed forward this portion of their task with much spirit and comprehensive-

ness of purpose, so as to have it ready for the early meeting of parliament.

The great increase during the past year in the rate of mortality, and the impending visitation of the cholera, have led the Commission to direct their attention, more especially in this stage of the proceedings, to cleansing, draining, and paving, in conjunction with an efficient water supply. Cholera, fever, or any other disease to which large numbers of individuals are liable, must be either set at defiance, or rendered harmless. The Commission, we find, recapitulate the instructions issued by the London Board of Health in 1831, on the best means for checking the progress of the disease. 'At that time,' however, to quote the words of the Report, 'not only had no knowledge been acquired by experience of the true character of this disease, but nothing was known of the real condition of the classes which proved to be its first and easy victims, nor of the state of, the localities in which they lived. The official inquiries which have since been made into the sanitary condition of the districts inhabited by the poorer classes, have disclosed a state of things which must expose, as is now universally admitted, the vast masses that are crowded into them to the ravages of every epidemic that may chance to prevail; and if this be true of epidemic diseases in general, it is emphatically true of the special disease under consideration.'

We have then a statement showing that the breaking out and spread of the cholera occurred under similar circumstances all over Europe. In the cities and towns attacked, it invariably made its first appearance near the water side, by muddy shores, along rank ditches, or at the outlets of foul drains. Whether in Petersburg, Moscow, Dantzic, Berlin, Paris, or London, the first victims were always found in the localities above specified. Fever is seldom or never absent from such places as these; and as we have frequently shown in our notices of the sanitary reports, there is scarcely a town in this country in which these pestilential hotbeds of fever are not to be met with: dirt, damp, and darkness, are three mighty affluents of cholera, or of disease of any kind. And it is a fact worthy of record, that notwithstanding the humid atmosphere of Holland, the Dutch, owing to their general scrupulous cleanliness, were remarkably exempt from cholera.

It is now pretty satisfactorily ascertained that cholera is not contagious; attempts made to communicate it from one person to another by mere contact signally failed. A knowledge of this fact must tend very materially to establish confidence, and prevent that neglect of persons attacked by the disease, many painful cases of which were brought under notice on a former occasion. Something appears to depend on geographical position: the cholera committed great ravages in Paris and London, while Lyons and Birmingham escaped unharmed. The latter town is not remarkable for cleanliness, but it lies high,* on a dry, absorbent, red sandstone. Among other physical conditions which promote epidemics, are instanced impure air, unsuitable food, and deficient clothing; the Commission consider the second of these conditions more likely to be a predisposing cause than real want of means—'amidst a population in which upwards of L24,000,000 per annum, or more than five times the amount of the poor's rates, is spent in ardent spirits alone, and nearly an equal amount in tobacco and fermented liquors. . . . The want of sufficient and proper food,' continues the Report, 'by diminishing the vital energy, and thereby the power of resisting external noxious influences, renders the body the easy prey of whatever causes of disease

* Birmingham, being between 300 and 400 feet above the level of the sea, may be considered as singular in this respect among the large towns of England. Probably, however, the exemption from cholera in 1831, and the small amount of fever at all times, for which this town is remarkable, are in a greater measure owing to the number of separate dwellings used by the middle and lower classes, and the great quantity of ground which the town consequently covers.—Ed.

* One of the baronial residences of the De Créquy family.

may surround it. In the present state of most towns and cities, the number of persons whose constitution is enfeebled by want of food, compared with the number whose vital energy is depressed by want of pure air, is found to be an exceedingly small minority. We have little power to deal with the former class of predisposing causes; but we have complete power, by arrangements which are known, and which involve large and manifold economies, to remove from the Metropolis, and from every lane, court, and alley of every town, the sources that poison the air. Here, then, is the true field for exertion.'

The Commission lay great stress upon the fact, that cholera invariably follows the track of typhus. The *habitat* of the latter is unfortunately but too well known: it is in the unpaved, undrained streets and alleys, saturated with the fætor of cesspools, shocking the senses with filth and squalor. Incredible as it may seem, we learn from the Report that little or nothing has been done towards abating the evils signalised. Even where drains and sewers have been made, the condition of the neighbourhood has been altogether unimproved, from imperfect discharge of the sewers, and want of a proper supply of water. The evils of a deficient supply of the indispensable element are forcibly urged. Some districts, it is stated, are not only not improved, but are in a worse condition than in 1832; fever, according to the evidence, is never absent from them; in fact, the fever generated daily and hourly in these wretched localities is proved, in some instances, to be more fatal than cholera. On a comparison of three of the metropolitan districts, taking 1838, the first year of the registration—'in the first case the deaths from fever were more than double the deaths from cholera; in the second case more than treble; and in the latter case they were nearly five times the number.... The whole difference between the mortality produced by cholera and that produced by fever is under eight per cent.' For several years, the rate of death from fever has been steadily progressive in the Metropolis; in 1846 it was double that of the preceding year, and in the year just expired it has been still more in excess.

The Commission suggest alleviative measures, which apply equally to the prevalent unhealthiness and to cholera. In case of an attack of the latter disease, they discountenance removal to an hospital, and 'recommend that the best provision practicable should be made for rendering effectual assistance to the individuals who may need it at their own houses. 'This,' they continue, 'in our opinion, would be best effected by the selection of proper persons, who may be instructed as nurses, and engaged to devote their whole time to attendance on the sick at their own habitations, under the directions of the medical officer. Prompt assistance might thus be given to the patient, without subjecting him to any risk from bodily fatigue, and without anything being done calculated to excite apprehension or alarm.'

A perfect system of draining and cleansing is insisted on as the only effectual preventive means. Let this be well and thoroughly carried into effect; and although it is not contended that disease will become altogether innocuous, yet there will be no longer ground of reproach for neglect of duty.

The modes of drainage are next discussed, together with the relative advantages and expense of various forms and dimensions of sewers. The folly of making sewers without house-drains leading into them, forms an especial subject of notice, combined with an exposure of the present utterly inefficient mode of constructing these drains. Instead of being square, and made of common bricks, they are to be of glazed earthenware circular tubes, which are not only cheaper, but much more effectual for the purpose. 'Thus,' says the Report, 'whilst a twelve-inch drain, which is required by the Kent and Surrey, and the Tower Hamlets, and the City Commissioners, accumulates deposit, and generates noxious gases, a tubular earthenware drain, of nine times less capacity, or of four inches in diameter, or

proportional to the house, of from three to six inches, keeps perfectly clear. Even three-inch drains convey away the refuse from middle-sized houses, and keep perfectly clear, whilst the layer permeable brick drains, which are usually charged three times the price, are choked up.'

It is impossible that there can be effectual drainage without a constant and abundant supply of water; in some instances the construction of drains has only made the atmosphere of houses more poisonous than it was before. According to the inspector of sewers, there is nearly always a current of air setting from the sewer into the drain, so that they become 'as retorts with necks carried into the houses for the conveyance of the gases there.' A recent case of death in Langley Court, Long Acre, is clearly traced to impure air generated in a foul sewer. This sewer was five feet six inches high, and three feet wide. The filth had accumulated in it to a depth of three feet, and remained stagnant—an instance of useless and wasteful expenditure, combined with entire inefficiency. A six-inch tubular drain would, without stoppage, have carried off the whole drainage of the court, while the saving in expense would have been L.5, 17s. 6d. per house. Mr Phillips, the witness examined on this point, observes—'The sewers of this sort are only elongated cesspools; and not only is almost every house infested with one or more cesspools, somewhere within or about the premises, but probably the inhabitants, and the public generally, are not aware of the existence of such enormous cesspools under the streets. If the whole of the sewers of this description could be uncovered and seen, their horrible condition, I feel assured, would almost stagger belief that such a state of things could be, and that the authorities having control over them could allow them to continue so even for a single day longer.' Other witnesses speak of huge sewers being constructed for mere dribbles of water; nearly the whole sewage of London, in fact, is a subterranean monument of 'vested' shortsightedness and ignorance. The surveyor for the Tower Hamlets states that no provision was made in his division for the draining of courts, no estimates contemplated for this object, or the draining of private houses, no consideration of future utility or water supply; and yet the Commission of Sewers for that district were about to apply to parliament for an extension of powers and privileges. From the evidence adduced, the Sanitary Commission 'have confident assurances that cesspools may be abolished, and a complete system of house drainage maintained in houses of the poorer class for a rate of twopence-halfpenny per week, including a constant supply of water carried into each house.'

Without a complete system of levelling, it is obvious that a perfect system of sewage cannot be combined. The Commission believed that complete levels might be obtained from the existing materials, the bit-by-bit surveys of each district; but the ordinance officer applied to on the subject denounced the whole as utterly worthless—affording another proof that nothing useful or effectual in regard to so great a work can be accomplished, unless combined under one vigorous system of management. In summing up, the Commission state that, 'for the prevention of disease, and the saving of health and life, by early carrying out efficient works of drainage, and diminishing the mass of atmospheric impurities by which the public health is depressed, and for the prevention of expenditure upon inefficient works, we feel it our duty to recommend an immediate exercise of the powers of the crown; and that the several commissions appointed under its authority in the Metropolis be recalled with the least possible delay; that the law of sewers, now administered by numerous persons in these separate districts, be confided to one body of commissioners for the whole of the Metropolis.'

This recommendation has already produced some good effects: the Heptarchy of Sewage Commissions, as they were called, for the Metropolis, have been super-

acted by writs issued by the Lord Chancellor; and the whole management of the work of drainage, &c. is confided to a new Commission, composed of twenty-two gentlemen of known ability and earnestness in the cause of sanitary reform. London, which should be a model to the whole kingdom, has, generally speaking, been slow to bestir itself in questions of immediate vital importance. The inhabitants of the great city will often contend stoutly for the perpetuation of old abuses or worn-out prejudices; let them now show equal spirit, in promoting the views of the new Commission, and the Metropolis will become a centre from which the most beneficial influences will extend over the whole country. The point of the wedge is now fairly inserted, and it is to be hoped that the work will go steadily on to a successful accomplishment.

The inquiry, which is still going on, has brought to light many abuses under the old system of management. Among others that have come to our knowledge, we may mention a case of a sewer paved with granite. The employment of so expensive a material naturally led to investigation, when it was ascertained that the chief promoter of the measure—a person occupying an official situation in the city—traded in the article, and had supplied the granite. Not least among the benefits of the new system will be the prevention of wasteful expenditure. The Report, which, as we have shown, is entirely to the purpose, has the further merit of being short: we commend it to the careful attention of municipal authorities all over the country.

HISTORY OF A DESERTED SAILOR.

On the morning of Saturday, the 5th of May, upwards of a century ago, a ship belonging to the Dutch squadron came in sight of Ascension Island. Anchoring at some distance off shore, she put off a boat, which, under the efforts of an active crew, made rapidly for the island. The boat contained, besides the crew, an individual heavily manacled, and a guard. The prisoner, seated at the stern between the two soldiers who guarded him, sat with his head buried in his hands; but gave no further sign of emotion until he was disturbed from his position by the sound of the boat grating on the white shore of Ascension: when, with an agonised look at his comrades, and at the vessel, he silently rose, and in company with his guard, left the boat, and stepped on to the beach of his prison. A sailor's chest, some bedding, and sundry other articles, were taken from the boat; the prisoner's chains were removed in silence, and the crew and guard re-embarked, leaving him alone on the beach; and nothing moved by his now frantic intreaties to them to return and take him with them, they pulled hard to the ship, apparently anxious to take leave of a scene so painful. Arriving on board, the anchor was presently heaved, all sail set, and the vessel stood out to sea, leaving the unhappy man sunk on the sand in the most abject despair. Before noon, she was out of sight; and in every direction nothing was visible but the blue and desolate waters tossing up their heads to the sky. The nature of the crime which was visited by this dreadful punishment we are not permitted to divulge; but that it was of great heinousness, may be gathered from his own confessions. Some mercy mingled with the sentence, as was manifest in the numerous little articles which were left for him on the shore. Among these was a limited supply of provisions, consisting of a little rice, onions, peas, and meal. He had also a cask of water, two buckets, an old fryingpan, and a fowlingpiece, but no ammunition. Some paper, a Bible, a few clothes, and some unimportant sundries, completed the list of his possessions.

The island itself was of a nature so savage and repulsive, as was well calculated to impress with horror and despair the stoutest heart condemned to so vast a dungeon. Being of volcanic origin, its surface was strewed with broken rocks, ashes, and pumice; here

and there a little red soil, scorched and sterile, peeped from between masses of rock upon which the traces of fire yet existed. Its shores on one side were frightful to approach: horrid precipices of black lava seemed to fringe the island with mourning, and threaten intrusion with death, while at their base were deep chasms, eaten out by the insatiable wave. Farther on, the wildest confusion of rocks, whose jagged summits added to the desolation of the spot, was occasionally relieved by small patches of a glittering, naked beach, white like snow, composed of fragile coral, and flatter shells ground to dust against the iron bulwarks of the island. The other side of the island was more hospitable, possessing a less frowning coast, a good bay, and a tamer sea-shore. Inland, a few acres of plain stretched away between the gloomy-looking hills; but even these were either wholly barren, or scantily covered with a weak growth of innutritious plants, such as grass, ferns, purslain, a few thistles, and a convolvulus. Not a shrub was there on the whole island; and the only spot refreshing to the eye wearied with so long a glance at desolation, was a tall mountain called the Green Mountain, whose verdant sides gave the promise, which they did not fulfil in reality, of supplying something that might support the outcast during his stay there. The spot was, on the whole, somewhat like a vast cinder, spotted here and there indeed with green, but otherwise as dry and burnt as if it had just been vomited from the depths of some vast volcano. Yet the place was the habitation of a legion of wild goats, and populous nations of rats and mice over-scrampered it; and one or two tribes of melancholy insects awoke with its morning sun, and went to sleep at an early hour in the afternoon. Its shores, fierce looking though they were, were more lively: flocks of 'boobies' strutted along its glittering sands in all the impertinent independence consequent upon unacquaintance with mankind; a vast turtle or two, six or seven hundred pounders now and then, crawled from the blue waters, and after taking a short walk for the benefit of their health, crawled in again, walking over possibly hundreds of enraged crabs on their way back; and the waters themselves were livelier still, for they abounded in eels, old wives, and rock-cod. The extreme length of the island was a little more than seven miles, its extreme breadth about six, and its general form was oval.

Such were the miserable and most unpromising circumstances under which this unhappy man was left to take his chance of perishing utterly, or the more remote one of being discovered and rescued by some passing vessel. As his journal, which he regularly kept from the first day of his landing, has been preserved, we are able to proceed with the rest of his history. After recovering in some measure from the shock of being left alone, and after watching with an aching heart the ship's snowy topsail sink beneath the waves of the horizon, he addressed himself to his first labour, which was the construction of a tent. The spot he selected for its site was sufficiently gloomy, for it was beneath one of the dismal overhanging black rocks of which mention has been made; but it assisted to cover his tent from the weather, and it was close to the beach upon which he, and all he possessed, had been left. By the close of the first long and weary day, a temporary tent was raised, into which he brought his chest, bedding, and all his other chattels; and here, heavy and sick of heart, he spent the first night. Rising early the following morning, after partaking of his lonely meal, he set forth to explore the island. It was the Sabbath, and around was more than the stillness of that sacred day—it was the silence of the grave. No 'church-going bell,' no faint notes of a village hymn, no quiet tumult of a departing congregation, came to the outcast's ear—the wind was asleep, the waters were at peace; but in his heart there was no peace, and he himself was alone unquiet amid surrounding quietude. He searched in vain for some green thing which might promise him food; he then returned

to his tent, and, to beguile the dull hours, set about some alterations in its arrangements; he also covered it with a tarpaulin, which he fastened down with stones, thus securing himself from rain. Towards evening, the solitude of the beach was broken by bustling flocks of boobies; on approaching them, he found them so tame, as to permit him easily to seize several, which he afterwards killed, skinned, and salted, laying them in the sun to dry. His eyes were ceaselessly directed to the horizon; but viewed from whatever eminence, it revealed nothing but the same hopeless, unbroken blue line. Hoping it might catch the notice of some distant vessel which might escape his eyes while searching for food, he made a white flag with a portion of his linen; and fastening it to his almost useless fowling-piece, he planted it in the most conspicuous position he could descry. Sauntering afterwards along the beach, he had the good fortune to overtake a fine turtle, which he killed by beating it on the head; and this supplied him with provision for a little time. As the terrors of his lonely situation grew upon him, he began to fear lest the threatening overhanging rock, under which he had placed his tent, should suddenly fall and overwhelm him: he therefore removed his dwelling to a less alarming position. He was by this time in a very miserable and disconsolate state of mind: often, after a long day's fruitless search for water and food, returning home with torn feet and an aching heart, he would pray, with one of old, that he might die. But he would by no means be accessory to his own death, as, in the constancy of hope, he still looked to his signal being seen, and himself delivered out of 'that terrible place.' Conceiving it singular that he had met as yet with no beasts upon the island, he searched carefully for footmarks on the beach and inland; but without success; the unbroken surface declared to him, again and again, that he was alone. The contents of his water-cask also daily reminded him that, unless he shortly succeeded in finding water, the most terrible fate awaited him. On one of his excursions he met with a little purlain, which he boiled with the boobies, and thus made a tolerably palatable dish for one in his condition. The few other herbs which that niggard desert afforded he was afraid to eat, nor were they sufficiently inviting to induce him to make the attempt. Every day saw him now anxious and careworn leave his tent, bucket in hand, seeking for water; and every day saw him return in the evening almost fainting, and with an empty vessel. His supplies of food also grew short; boobies became scarce—turtle were not seen. He then used to boil a little rice in a little water, of which he made most of his meals. Many, many times, and with a gaze made intense by the struggle in his mind between hope and despair, were his eyes bent upon the lonely waters, but no ship appeared. It was fortunate that, as yet, his bodily health continued good. Thus were his days spent at this time: in the morning, the spring of hope poured its assuaging waters over his soul, and he set forth fully expecting success of some sort; in the evening, those waters were cut off, and he beguiled some of the tedium of the night by reading until his eyes were weary, and then, as a diversion, he would set to mending his clothes. Finding no promise of native esculents, he thought to increase his stock by planting a few of those he had with him. He therefore set some onions and peas in a patch of soil near his tent. Finding a number of nests of sea-fowl, many containing eggs, he plundered them, and made his principal food of their contents. He was for some time much at a loss for a light at night; at length he hit upon the expedient of melting down some of the turtles' fat; and thus, with a saucer for his lamp, and a bit of rag for the wick, he had a tolerable light, which he used to keep burning all night. Thus passed a fortnight of his life in this great prison.

All his search for water had proved unavailing, and he was under the painful necessity of daily diminish-

ing his stock, without the means or the prospect of being able to replenish it. He explored the island in a new direction, looking narrowly into every cranny of the rock, and searching every spot covered with a little fresher-looking herbage than the rest; but no bubbling waters appeared. Bethinking him, then, of his fishing-tackle, he repaired to the rocks to try his fortune in a fresh direction; he spent several hours in this employment in vain, which was somewhat remarkable, as the waters were unusually prolific of fish. Meanwhile a sad accident had occurred. Turning homewards, what was his surprise to behold a dense volume of smoke rising up to the skies in the direction of his tent! Deeply alarmed, and dreading the worst, he flew with the utmost speed to the spot: he found the presage too true: his tent was on fire! Hastily snatching up his buckets, he ran to the sea; and thus, by considerable efforts, he was enabled to quench the consuming element. It appears that the origin of the fire was attributable to his having carelessly left his tinder-box, with some lighted tinder in it, upon his quilt. By this calamity he lost a shirt, a handkerchief, and a part of his quilt; and his Bible was much singed. Yet he felt thankful to God for what he had saved. He then knelt down, and earnestly intreated God to 'give him the patience of holy Job' under his accumulating sufferings. The spirit of his journal at this time is one which betokens a degree of humble acceptance of his punishment, severe as it was, and of patient submission to the Supreme Will. Thus the month of May passed away—his provisions diminishing, his barrel of water failing, his hopes growing fainter, and the future full of the gloomiest anticipations, in consequence of the rapidly-increasing heat of the weather.

On the 1st of June, there is this touching entry in the journal:—'It would be needless to write how often my eyes are cast upon the sea to look for shipping; and every little atom in the sky I take for a sail; then I look till my eyes dazzle, and immediately the object disappears. When I was put on shore, the captain told me it was the time of year for shipping to pass this way, which makes me look out the more diligently.' At the end of the first week in this month, he had but two quarts of water left in his cask, and this was so muddy, as only to be drinkable after straining through a handkerchief. He then thought of digging for water. After digging to the depth of seven feet, he found not so much as a trace of moisture, and he desisted from his labour with feelings easier conceived than described. At this time deep considerations of his apparently approaching death filled his mind, and he spent many hours in prayer and in solemn meditations upon a future state. On the morning of the 10th of June, faint and sick with thirst, he drank his last portion of water to the very dregs, and in the strength of it he went out on a fresh search for some of this precious fluid. After four hours' tedious walking under a burning sun, he at length became so weary and faint, as to be unable to proceed any farther, and he lay down wishing he might die. His situation was that of the fainting Hagar in the wilderness, and his deliverance was to prove as signal. Rising at length from the earth, he walked slowly over the rocks towards his tent, as he thought, to die. But not so: his eye was led to a hollow place in a rock, toward which he eagerly sprang. Who can paint his joy, or describe his gratitude, on finding that it contained a little silver rill of water, pure, cool, and fresh! The poor fellow cast himself on the earth, and drank most immoderately of the delicious fluid. In the intoxication of his joy he sat down by its side, and drank again and again of its life-giving draught. The treasures of the whole earth were poor and mean in comparison with that tiny streamlet. Evening was closing in, and taking care to mark well its position, he returned to his tent with a step more elastic than he had yet known, and a heart brimful of gratitude and joy. Thus one source of his deepest anxiety was, for the time at least, diminished. He was now

able to use the water freely; but whether from previous excessive over-fatigue, or as the consequence of a long disappointed hope, cannot be said, but it is evident that now symptoms of delirium began to appear, and of these he was himself conscious. Strange fancies filled his mind at times, which disappeared at other times. At this period there occurs the following remark in his journal:—'It makes me very melancholy to think that I have no hopes of getting off this unhappy island.' The sharp volcanic rocks, which were like so many broken glass bottles, cut his shoes to pieces, and wounded his feet so severely, that he was scarcely able to stand upright. Now also a terrible adventure befell him. Awaking from sleep, he heard a dreadful noise around his tent. Listening more attentively, he recognised the voices of either men or evil spirits in loud conversation close to him. This continued all night, so that he awoke in the morning unrefreshed. The next day, and for several days subsequently, he speaks of having been repeatedly accosted by an apparition, which assumed the form of one of his old comrades. Greatly to his relief, it at length departed. Although it is manifest the unhappy man firmly believed all these supernatural events, we are safe in ascribing one and all to the inroads of delirium upon his understanding. Possibly, from the free use of water, these symptoms, which might have taken a part of their origin in the want of that fluid, disappeared; and the entries in the journal resume their usual simple character. For some time past his supply of wood for fuel had failed him, and, as we have before mentioned, that not so much as a shrub existed in the island, he began to despair of again tasting cooked food, when one day, as he paced along the beach, a good-sized tree was cast ashore. This he cut in half, and was thus resupplied with fire materials for a little time. Another difficulty then opposed him: he was quite unable to procure any fresh food; and with a 'raging hunger' preying upon him, he wandered about the island seeking it in vain. As if to heap misfortunes on his devoted head, the increased power of the sun, the heat of which blistered his face, dried up his well. Previously to this he had filled his cask, and, for convenience' sake, had removed most of his things to a cave near to the well. Thus were all his first anxieties renewed again, while there remained to him less energy of body and mind to struggle against them. One day as he wandered along the shore, he was startled at the appearance of a rude cross in the distance. On approaching it, he found it the grave-mark, as he conjectured, of some one buried in that spot. This was the first token, he had perceived in the island of a previous visit by his fellow-men; and while it kindled hope, it was also full of melancholy promptings upon his own condition. He, too, appeared to be cast there as one dead, yet with this difference—as one deserted in his death. This brings us to the close of another month. In spite of the most diligent search, water was not to be found. On the last day in June he writes with mournful brevity, 'There is now not one drop!'

July opened upon this miserable man with all the intense heat of the season in that latitude. In one of his water-seeking expeditions, he saw, for the first time, large flocks of goats, to the amount of several hundreds. He vainly endeavoured to pursue them; but they proved far too swift for his decaying strength, and bounded away, leaving him in his desolation. Great flocks of sea-fowl were often visible in the strand, in such numbers, that, when they took wing at his approach, they appeared like a dense cloud, which, coming between him and the sun, completely intercepted the light. Once he found a brush on the shore, and early in August he discovered other traces of the visits of previous voyagers, finding in a rock—which, at a distance, looked something like a rude cottage—some old nails, and pieces of broken glass bottles, and also a piece of a broken oar. He now called to mind his early

attempt at horticulture, and set out for the spot where he had planted his peas and onions, near to the place where he had first pitched his tent. He saw from a little distance, to his joy, that some green plants appeared on the spot, and on drawing near, he found that a few had sprung up; but as if the withering hand was upon him in all things, the rest had been utterly devoured by vermin. For the period of three months there had not fallen a half hour's rain on the island. At this period of his history, with his miseries increasing upon him, he thus writes:—'My heart is so full, that my pen cannot utter it. I now and then find a little water, which the goats have left me. I always scoop it up to the last drop, and use it very sparingly.' On one of his visits to his old tent, while inside it, he was much alarmed at hearing a great noise, as if a 'hundred coppersmiths were at work.' His alarm continued until he resolved to search for the cause of this commotion, and ascending a hill, he discovered its origin in the chattering of a vast flock of birds, which whirled into the air as soon as they perceived him. This little discovery greatly relieved his mind, which, under the horrors of his situation, was become much enfeebled. He measured the contents of his water-cask, and found he had but six gallons left. He drank by measure, and eked out his allowance as much as he could, abstaining from boiling his food. The entries in his journal preserve a melancholy monotony—'Went out to search for water, but in vain,' is the only memorandum for many days. How earnestly he now lifted up his prayers and his eyes to the heavens, may well be imagined! But that saying was true of them which had its primary reference to another race, 'The heaven that is over thy head shall be brass, and the earth that is under thee shall be iron.' 'I looked up,' he writes, 'to the heavens all round me, to see if the sky was overcast, that I might have some hopes of rain; but all, to my sorrow, was very clear.' He was now frequently out until evening looking for water, and many times was far from home as the shades of night approached. On one of these occasions, the sun having set, he was compelled to sleep away from his cave: having lain down, his slumbers were soon disturbed by new tormentors; such a prodigious number of rats surrounded him, as put him in considerable jeopardy of being devoured alive. He took good care after this to return to his cave before dark. Despair was now rapidly seizing his mind, resisted only by a few feeble struggles of expiring hope: he had now 'given up all hopes of finding any water,' and wandered on the strand lost in distraction. Here he espied a turtle, which he succeeded in killing; and he slaked his burning thirst with the greatest avidity in the creature's blood. At a later period, he found some relief in drinking the fluid contents of the eggs of the sea-fowl; but both proved ill substitutes for water, and he was seized with an illness, which he ardently hoped might end his sufferings. His head swelled, he became dizzy, and was frequently delirious: he could no longer walk, and could only crawl from place to place. He often crawled up to a turtle, which, with his razor, he killed, and then the poor fellow lay by its side quenching his thirst in its life-blood. And now approaches the close of this mournful history. Burnt up with thirst, he drank, in desperation, a quantity of salt water; but this had nearly proved immediately fatal to him. Now, in a few affecting words, he scrawls, 'I am so much decayed, that I am a perfect skeleton, and cannot write the particulars, my hand shakes so.' Further on—'My wood is all gone!' 'I hope the Lord will have mercy upon my soul.' The last entry is on the 14th of October, when the unhappy outcast records the short and simple words, 'All as before!'

Thus perished the deserted sailor, after the endurance of bodily and mental agonies, for upwards of five months, a part of which only would have sufficed to unseat the reason of many men. (We believe the facts here narrated may be considered genuine and authen-

tic. They are contained in a tract preserved in the Harleian collection, which states, in addition, that some months after the poor fellow's death, a ship touched at Ascension, and found his journal, and his body, and possessions there. Yet this unhappy man need not have died: a little knowledge of the first principles of chemistry would have saved him. We were struck recently with the expedient of some sailors in procuring fresh water from salt, which, though perfectly familiar to us before, deserves notice. The apparatus was an iron pot, a wooden lid, and a musket barrel. By this means a good supply of pure fresh water was obtained by distilling the salt water. So might our outcast have saved himself from death. How easy to make a still of the teakettle which he had, and a worm of the musket barrel! Two or three hours thus spent every day, might have supplied him with sufficient fresh water for all his necessities, and preserved him from the dreadful death which overcame him. Not knowing into whose hands these pages may fall, we have thought it worth while repeating this homely suggestion here. How different now is the aspect of this once melancholy island! Many acres of the Green Mountain are under cultivation; esculents of all kinds grow in abundance; roads have been made; a plentiful spring of water has been discovered, whose contents are conveyed by iron pipes to a large tank in the English fort. Cattle, and sheep, and livestock enliven the hills, where wild goats still wander in immense numbers. An importation of terriers has exterminated the rats. Fruits of various kinds adorn and enrich the gardens. A safe anchorage has been found, in which many a gallant ship has ridden; and a government establishment gives Ascension its laws and orders. Thus have the united efforts of men caused this 'wilderness to smile and blossom as the rose,' where all the energies of one unhappy individual proved insufficient to deliver himself from the combined terrors of thirst and hunger.

OCCASIONAL NOTES.

NATIONAL DEFENCES.

THERE is an assumption of offence being meant, which is almost as bad as to give offence. It strikes us that this is eminently the case as between nation and nation. For one of these aggregations of humanity to express an apprehension of danger from another, is assuredly an unfriendly demonstration on its own part, and we can readily imagine such a thing leading, through a brief process, to a diminished inclination for peace on both sides. Thus to increase the likelihood of war, merely by a false imputation of bad dispositions in a neighbour, is surely much to be deprecated. It becomes an obvious duty of nations, living peaceably side by side, to be careful of adopting any erroneous views as to each other's inclinations in this respect, lest they precipitate the very evil they would guard against.

Entertaining these views, we cannot but think the present an unsuitable time for raising an alarm about the means of national defence; that is to say, supposing that these means are not sensibly less in magnitude and force than they have been at any time during the past thirty years—which we believe to be the case. The tendency to war was certainly never less than it is now among any European people. There is no feature in the state of foreign nations to give the least increase of apprehension. On the contrary, we are at the commencement of the experience of a great change in international economy, which manifestly has a tendency to create a community of interests among nations; while increased means of personal communication are everywhere making them better acquainted with each other, and thus diminishing mutual antipathy, and increasing mutual affection. This is rather a time for putting on the smile of kindly good-feeling towards our neighbours, than the sullen scowl of suspicion. We are no more advocates for a Quixotic benevolence, than for an irrational jealousy; but we do think that it would

have been more appropriate, at the present crisis, to hold out some additional signals of friendly regard and generous fellow-feeling towards other states, than to get up a cry that we are not in a fit state to defy them to do their worst. When will the time come for states to assume in their relations to each other the looks and language which give sweetness to the relations of private life—those demonstrations, for example, which will cause natives of different countries, when they meet and travel together for a few days, to become attached and friendly, and to regret the approach of the hour which must part them? Odd as it may sound—from the mere novelty of the idea—there is nothing in the relation of man to man more than in that of state to state; and France and England have at this moment as little reason to fall out with each other, as a Frenchman and an Englishman have to get into a quarrel on meeting at a table d'hôte in Brussels. To render a little service to a fellow-creature, or even to express sympathy with him on the occurrence of a domestic affliction, makes him a friend. Suppose that, when an opportunity of obliging the French were to occur, we were to take it. Suppose, on an occasion of famine in France, we were to offer them aid in the language of unmistakable good-feeling: might we not expect the same results as we find in similar cases in private life? Undoubtedly. Hours of time and pounds of money devoted in this way would go as far as years and millions in any other way spent. One sentence of honest good-feeling spoken with little ceremony, were worth whole bureaux of the most elaborate diplomacy conducted in that style of cunning and dexterity which has come down from old times as the style proper to international affairs, but which is only devil's wisdom at the best, and necessarily unavailing to any good purpose.

Some years ago, there was a district in the Highlands of Scotland which was in such a state of Arcadian simplicity, that the locking of doors by night had fallen into desuetude. An Englishman came to take a situation of trust in the place, one long accustomed to all the rogues and sharperisms of London. His discourse was full of references to clever expedients for detecting and defeating frauds, and, as a matter of course, he locked his door. The suspiciousness expressed by his words, and, in particular, by this deed, made him decidedly unpopular. So may nations, which are meaning no offence, be provoked by the arming and defending of a wrong-witted associate. No doubt, if there were any very strong and decided ground for apprehension, it would be proper to arm nevertheless. But this ought to be very clearly ascertained before the provoking policy is entered upon. We do not scruple to avow our belief that there is no real appearance of materials for a war against England in any part of the earth, though we can imagine serious thoughts of it arising in some places if we should show, by the proposed defences, that our thoughts are not turned on peace.

Should we be told that peace-breathing sentiments are all very well, but that they will be unavailing against the attack of a bellicose neighbour—vain as it would be to coax a Hyrcanian tiger, or preach morality to a highwayman—we reply that we are not so ill prepared for defence as necessarily, on an exigency, to have only such soft expedients to look to. England found herself safe during the last war, when an amount of hostility was mustered against her such as scarcely any nation ever had to contend with. She is not weaker now in proportion to the force that might be brought against her, but probably much stronger. The fact is, that the difficulties of landing a large force in a populous island, possessing anything like decent means of resistance, are next to insuperable. There is also such a thing as the cheap defence of nations, of which we have abundance. We have a defence in that wealth which gives us the readiest command of the means of war. Peace and all its attendant circumstances, so far from disqualifying us for war, if the monster should come, are constantly adding to our best power for fight-

ing and resisting, in as far as they are constantly increasing our wealth, and enabling us to effect those social reforms which, by extinguishing grounds of complaint, are strengthening the fidelity of the people to their own common cause. In these considerations, it seems as if we had sufficient grounds for resting satisfied with the present amount of our tangible means of defence; and we earnestly hope that such will be the judgment of the nation, if the question of increased defences should be further pressed.

'IT IS ONLY A FORM.'

The recent trial for selling a commission in the East India Company's service is full of instruction. Two gentlemen are found guilty of this offence, and subjected to all the ignominy usually associated with criminality; while no one pretends to doubt that such commissions have been all but regular matter of barter for many years. In one country town known to us, the genteel residents who had sons to provide for, were accustomed to consider the giving of eight or nine hundred pounds for a commission in the Company's service as a matter of course. A clergyman had agreed to advance a son in this way; but when the papers were presented, and he found that he was expected to sign one declaring that he had given no money for the commission, he drew back, and refused, for conscientious reasons, to ratify the bargain. A gentleman of our acquaintance once took some steps with a view to obtaining such a situation by favour for a friend's son. He found it was set down to provincial simplicity that he should think of obtaining by favour or good-will what brought several hundred pounds in the market! Such being the case, the actual culpability of the two condemned gentlemen becomes somewhat different from the apparent, though we certainly should not like to become their advocates.

It seems at first a little difficult to understand how men moving in a respectable sphere of society should have been able to get over the difficulty of making a declaration directly contrary to the truth. We suspect that, after all, this is but little of a marvel. In public affairs, there are so many things merely formal, and not real, that men's sense of rectitude as to what they say and sign is apt to be much confounded. For example, a cathedral chapter is called on to elect a meet person to be a bishop, as if it would be an error on their part to elect one who is unmeet; but there is no real choice in the matter. They would break a somewhat terrible law if they were to fail to elect the particular person pointed out. Continually such things occur, 'You sign this; it is only a form.' It may be an attestation of something you know nothing about; but it is only a form. Hesitation would look like Quakerism or imbecility, and you sign accordingly. The effect of such things must be demoralising, by reason that they accustom men to treat the semblances of solemn affirmations with levity. While they are so rife around us, we suspect that declarations like those given on obtaining a commission for a son in the East India Company's service, will be but a slight protection against a breaking of the law, even though one culprit out of a thousand be now and then detected and exposed.

MIDSUMMER EVE.*

A FAIRY tale of love, bearing the date of the year of grace 1848, and not specially intended for good boys and girls, but likewise for grown men and women! This is an odd fashion; but it must be owned it is the fashion; and, moreover, that the genius of one of the most graceful of the female writers of our day, never looked more graceful than when arrayed in its phantasy. The chief fault of the volume is—and we like to get out the critical growl at once, and have done with it—that Mrs Hall, aware of having seized upon a capital idea, has

made somewhat too much of it: that her fairies appeer too often, say too much, do too little, and are not sufficiently distinct in their character and feelings for human beings. But such objections are neutralised by the fact, that the story would be very beautiful and interesting even without the aid of the supernatural machinery at all; and the candid reader accepts this adjunct as something intended to soften and refine the common incidents of life—and, above all things, to admit of a store of pictorial illustrations and ornaments, such as few works of the kind can boast of.

The substance of the literature, and most of the illustrations, appeared originally in the 'Art-Union Journal,' which in itself is sufficient evidence of the value of both; but the names of the fair author, of Maclellan Stanfield, Landseer, Paton, Creswick, and numerous other artists of distinction, afford an additional guarantee. This origin, however, has been productive of another peculiarity—that the hero of the tale is a artist; and although we concede to certain critics, that the people of this country have not sufficient familiarity with art to feel any deep interest in the recorded tunes of its followers, still it should be observed, that Mrs Hall has had too much tact to treat the young gentleman before us as a professor. It is not the incidents of an artist's life which delight not the millior but the prosing about art itself, the æsthetic mysteries which they can neither comprehend nor enjoy and in 'Midsummer Eve,' all this is either avoided entirely, or touched upon so lightly, as to give refinement to the narrative without weariness.

The story is founded upon the popular belief in Ireland, that a child whose father has died before its birth if born on a midsummer's eve, becomes the rightful property of the fairies; and the esoteric purpose of the work is to describe the conflict of good and evil influences to which the individual is so delivered. But setting these aside, the tale, as we have hinted, is capital tale in itself, and the child in question grows up into a glorious girl and a heroic woman, as naturally as if there were no such beings as fairies in all Ireland. We must not detain the reader longer, however; but proceed to lay before him a specimen of both kind of interest—the supernatural and the natural.

While the mother-expectant was in her last exigence on a certain midsummer eve—and a fearful eve it was,

On which a child might understand,
The devil had business on his hand—

an old nurse was watching anxiously for the arrival of assistance.

'A certain wise man—known as Randy the Wood cutter—had been sent off for the doctor; and while she waited his return, she had, she thought, frequently heard him "whisperin' and cosherin' at the door;" and yet he came not. At length, however, his well-known step was distinctly audible.

"Is all right, Randy?" she asked from within.

"All will be right when I knock," he answered, "and then open quickly."

"Is he on the road?" inquired the nurse, heedless of the warning; but before he could reply, a sharp blast rushed inward, and extinguished the flickering light of the lean candle she held with a trembling hand.

"A cross and a blessing about us, Kitty Kelly!" exclaimed Randy, falling on his knees. "God, he knows I couldn't help it. Why did you open the door before I knocked? I done all for the best, as the en will prove. Oh murder! Why don't you shut the door, instead of standing there like a rock in the lake there's something more than the wind passed in now!—bless yourself, woman, dear! Oh, then, sure it's impossible to tell what would be on the wings of the win this midsummer eve!"

Kitty is in great consternation; and the rather the Randy (who, the reader must know, is a celebrate seer), instead of bolting out the wind, stands staring and bowing to the rafters.

* Midsummer Eve, a Fairy Tale of Love. By Mrs S. C. Hall. Longman, London. 1848.

"Kitty Kelly, you're not altogether of this country!" exclaimed Randy in a low tone: "you've only been two hundred years in it—for you came in with couth Oliver Cromwell; so give way to your prayers—it's no wind that we're trembling in: of the three we're watching, one came in with me—the mistress will thank me for that; there was a second—and there will be a third. You may strive against them; I dare not!"

"I dare!" replied Kitty, whose courage had in part returned; and then she started, for she fancied she heard shouts of ironical laughter; but, little daunted, she attempted to close the door violently. In this, however, she did not succeed; the wind pushed against her, and not only had the best of it, but flung her to the other end of the kitchen.

"Make the blessed sign," said Randy, yet without moving to her assistance.

"I can't," she replied; "my hand's weighed down by a ton weight." She had hardly uttered the words, when a gust of wind, freighted with most extraordinary noises—sighs, and snatches of music, atoms of laughter, and fragments of old songs, mingled with the sound of rushing waters—entered the cottage, and filled it as with an atmosphere.

"It will shut aisy enough now," observed the woodcutter, rising from his knees, and wiping his brow. "Air, earth, and water! Oh, I'm not afraid to say my say about the good people, day or night; they never did me an ill turn, and never will; quiet, and kindly, and good they are, and mane nothing but good to the dear lady;" and his huge head nodded, and his long limbs bent and twisted, in a peculiar sort of homage to something invisible to all eyes but his own. The nurse thought it probable that Randy made the speech, and performed his gesticulations, in the hope of propitiating the good offices of the company whom she now knew had come to the birth. It was currently believed that he could see and understand more than be seemed an honest man; and yet Randy was an honest man, and had the unbought happiness of being more loved than feared. * * * The door was now easily closed, and the candle relit at the kitchen fire; the woodcutter threw upon it an additional heap of bog-fir: the old cat's hair stood out like porcupines' quills; every now and then she opened her mouth to hiss, but closed it again without a sound; she would lift a paw, and stretch it forth, bristling with claws; then draw it back again, each claw returning to its downy sheath.

"Sit down, Randy, and don't be showldering the chimney, as if there wasn't a chair in the place," said the nurse through her chattering teeth.

"I know better manners than to disturb any one from their sate," he answered, bowing round respectfully.

"The nurse crossed herself with the thumb of her right hand, and retreated to the bedroom of her mistress. The fire burned brightly, yet the cat took no pleasure in its blaze, but kept moving uneasily from one side to the other, "wrinkling" up her coat, as if water had been thrown upon it, her tail twitching and bristling in restless discomfort.

"It's hard on you, pusheen gra!" said Randy, addressing the cat; "but you can't help yourself. They'll neither hurt nor harm you, pusheen. They've got possession now, and they'll keep it," he thought to himself.

"They will!" whispered a soft voice in his ear.

This may be taken as an introduction to the supernatural parts of the story; but as for the fairies themselves, we dare not meddle with them, because, tiny as they are, they would take up too much room.

We must now turn to scenes of natural interest. The heroine, with her husband, a high-born but poor artist, is struggling for bread in London.

'But Eva had stern realities to deal with. Like all persons of great talent, Sidney was discontented with his own labours. He had "looked" at the old mighty ones—not to imitate, but to emulate; and it might be

that their strength was beyond his grasp, though not beyond his aim. This frequently dispirited the artist; and so intent was he on bringing up his picture to the ideal of his conception, that he would destroy the labour of a week, if any new thought—or a thought fresh set—suggested a better working out of his subject. As the spring advanced, Sidney became more abstracted, more nervous, lest his great labour should not be completed in time. He ceased to concern himself about the necessities of life, and then Eva rejoiced at being able to labour unobserved. She gloried in the great privilege of shielding him she loved from petty anxieties—the frets of life. She endured all things patiently, save the terror which arose from an idea that his mind was at times confused—overwrought, overburdened. He could not endure noise; the very gentlest tap of the lame boy's finger at the door would make him start, and render his hand unsteady. As the time approached when, finished or unfinished, his picture must claim admission, he could neither sleep nor eat. In the dead hour of night she would awake, and hear him pacing in the darkness, or see him through the gloom, leaning his head, at intervals, upon the frosted glass of the window to cool its burning. It was at these times—in these dark-thinking hours—that Sidney struggled bravely—as great men do not only with the hard and knotted world, but with themselves—against apprehensions which Eva never felt; but for her, the picture he laboured at would never have left the easel: he thought it unworthy of his better genius: he had neither space nor light for his great conception; commencing his figures on so large a scale, he had worked upon too small a canvas: the praise Eva bestowed upon it at times sounded like reproach, while at others it reconciled him to all contingencies. She looked upon his talent as certain of triumph; and, secure in that, was able to combat what, after all was achieved, would serve but as shadows to the great brightness of the future.' But in the meantime their necessities grew more and more urgent, till 'every trinket, every small luxury, had disappeared; but Eva did not murmur, for Sidney never missed them. Sometimes he would talk wildly about his hopes; at others sink down beside his easel in a sleep so unrefreshing and disturbed, that his wife would abridge it. The picture was his great stimulus, and he revived to fresh exertion. At length it was sent to the Academy, not finished as he intended it should have been, for painting in and painting out retarded his great purpose. But Eva thought, notwithstanding, that it would attract the world. Poverty in England was then denied all access to high works of art; but she would look at the pictures in the shop windows, and return with increased faith in the greatness of her husband's conceptions.'

The interval of suspense after the picture was sent to the Academy, and before the painter knew whether it would be received or not, was terrific. Sidney, however, poor Eva thought, 'would care little for his threadbare coat when Fame heralded him to the world, and wealth followed in her footsteps; and so they went on from one long day to another—the poor painter and his wife!—he fancying that she paled daily, she knowing that he was gradually wasting—until at last they divided crusts with Keeldar!—their faithful dog.

They are rescued both from illness and starvation by a good physician; and the exhibition being at length opened, the painter, more receiving support from his wife than giving it, took his way towards Somerset House.

'Eva and Sidney walked quickly along Oxford Street, but were obliged to pause at the crossing to let a pompous funeral go past. It moved slowly; the hearse heavy with plumes, the mourners in trappings of the deepest wo—all except their features! They expressed no sadness; the eloquence of death made no impression on them; they kept time to the horses' tread, and that was all. Some private and mourning carriages followed.

"We shall not be among the first," exclaimed the impatient Sidney. They crossed: another mourning carriage was passing: they were recognised by one of its inmates—it was the physician. He thrust his arm out of the window. "God bless you!" he said, and every feature of his kind face was lit up with pleasure; "I give you joy with all my heart."

"I daresay," whispered Eva to her husband—"I daresay he has heard the picture is well hung."

"You speak, dearest, as if you were certain it was admitted."

"A light, light laugh, such a one as had often echoed through the Dovecote, followed this observation. On they went."

"You are looking pale, dearest," said Eva; "shall we call a coach?"

"You require it more than I do, my own kind love," he answered; "but I fear we cannot spare so much."

"I have three shillings."

"The admission two, and the catalogue one."

"But you will get in free—have your card for the season, Sidney."

"He beckoned to a passing carriage, and the manner in which he threw his wearied frame upon the cushions, proved how much he needed rest."

"They alighted in the Strand; crowds of persons were hurrying forward; the joy-bells of the churches were ringing merrily; every person seemed to them in holiday dress. Together they passed beneath the portal of the once palace of the proud Somerset, pausing for a moment, and looking at each other. Eva fancied Sidney became paler than usual, but she could not be certain. Her head swam round, and motes, strange tiny forms, floated between her and him. She could not have defined her feelings: they were already of mingled hope and despair. She saw clearly enough that the "elect" walked confidently in, knowing they were "well hung." They had touched upon their pictures—a grace only accorded to those whose station and knowledge in art ought not to require such a privilege. She rejoiced in the happiness of others; but she wished that Sidney had the same certainty! She pressed his arm more closely to her side. He did not tremble, but she felt that he breathed earnestly, as if nerved for trial, and she dared not look at him again. Numbers who pressed forward were haggard and careworn: brows of noble mould, wrinkled by anxiety, not age, contracted over eyes filled with fire—blazing it out in discontent. Some, again, with compressed mouth, so rarely defeated—men who shape their own fortunes; others whose frank features were changed into recklessness by disappointment; numbers, bitter thinkers, who mistook a desire to paint for the power to do so; all these mingled with the visitors—some loving art for its holy self, others for its fashion, others, again, because the exhibition passed away time, that great material of the skilful workman!"

Unable to obtain a catalogue, they traversed the picture-rooms in an agony of suspense. "She felt that her powers of sustaining such a trial were passing away. In a whirlwind of conflicting emotions, she talked, hardly knowing what she said. She sprang to the next flight of stairs after her husband; but eager as she was, she could not equal the rapidity of his movements. "You see, you see; it is not here—nor here!" he repeated. Then in a hoarse voice he added, "Let us go down for a catalogue." Eva followed him breathlessly, but she felt as if her heart was breaking. When they were opposite the principal rooms, he paused, drew her hand beneath his arm, and bending down, whispered, "Do not sink now, my own heroic wife. You have sustained me through much worse than this, when all earthly friendship was far from us. It is not so now. I am, you see, calm—calm! There may be some mistake. Bear up, Eva! He who gave me such a treasure, will give me strength to keep it! Bear up, my darling; you always hoped more from this picture than I did! Bear up!"

"Gaining strength from his, Eva muffled her face in her veil, and clinging to his arm, they descended."

"A shilling," said the porter, as he handed the catalogue.

"Sidney could not say he had it not, but he turned away."

"Pay me next time," added the man, whose generous heart was in his kindly countenance. How their fingers trembled among the leaves, as a bird rustles amid the foliage that surrounds its rifled nest: eagerly they glanced over it.

"H—H—H—No Sidney Herbert!"

"Sad want of room, sir; some of the very finest pictures rejected for want of room. A fine exhibition could be made of the rejected pictures," explained the kind porter, who comprehended the scene at once.

"Sidney returned the catalogue."

"The gentleman looks tired," persisted the man; "better go and sit down in the sculpture-room."

"Neither replied, but Eva's look thanked him."

"There it is again," he muttered, looking after them. "I often wonder how I have stood it so long—poor things!"

"You hear, Sidney; some of the finest pictures have been rejected for want of room," said Eva.

"Oh, what agony was in the answering smile! What power—what eloquence—what anguish! too earnest, too intense for words! Heart understood heart. Never—never—never, in their long course of love, had each loved the other with such entireness of devotion as at that moment!"

"My Eva!" he said. She felt him tremble: she hurried him to the open door. There, rushing forward, came the physician. Although the mourning crape was still on his hat, his face was charged with tidings of great good. He was too full of it to impute their changed looks to more than ordinary fatigue. "I am delighted to have found you," he exclaimed; "such true homage as you have received!" Before the sentence was concluded, Sidney fell on his shoulder, to all appearance lifeless.

All this is admirable, and worth scores of fairies; but having now shown what kind of interest there is of both kinds, we must conclude, but not without assuring the reader that Sidney did not die this bout, but succeeded to a fine estate, where he and his high-minded wife, as is necessary in fairy tales, lived happily all the days of their life.

LOOK FORWARDS.

What, we ask, is the secret of British success?—Looking forwards. There are but few men in this country, we had almost said in any class of life, who have not been wronged and injured—we might say ruined—and all but annihilated over and over again, they and their fathers before them. Time after time we have begun life again, and rejoiced in a fresh start. Who cannot remember, if not in his own history, at least in that of his family, the greatest vicissitudes? We could point to men who, twenty years ago, swept shops and slept under counters, who were cast on the world orphans or homeless, or who, after a youth of toil, were strip of their all by dishonest partners or needy friends, who were ruined by commercial crises and financial uncertainties, who might have sat down and wept themselves to death at the sight of the misery around them, but who speedily wiped the tears from their eyes, and smoothed the wrinkle from their brow, who found hope at the bottom of their empty wallets, and set to work as if the world was before them, who have thus won from the future a revenge on the past, and remember what they have gone through only as a foil to their present prosperity. Such is the case not merely in the classes in which fortunes are lost and won, but even still more so the great industrial staple of the British population. Nineteen labourers or artisans out of every twenty could tell, if they chose, how they were buffeted in youth, how they were starved at home, slaved by their first masters, insulted, turned off, cast adrift, wanderers on the face of the earth. They could tell of cottages from which they were ousted, and commons of which they were defrauded; how

often they had to begin the world afresh, how often they were penniless and friendless. But they did not turn rebels and murderers. They did not even sit down to make a catalogue of their wrongs. They forgave what they could, and forgot the rest. They buried their grievances, and so put them out of sight. They looked before them for employment, and above them for aid. So they set to work, and built their nests again. Such is the story of that Saxon whom we are accustomed to hear so much beholden to fortune, to position, and to successful ascendancy. The secret of his success is in himself, as it is in every one who chooses to look forwards instead of sitting down to brood upon the past.—*Times*.

THE LARK.

BY W. MOY THOMAS.

PRITHEE, from thy topmost height,
Canst thou see the lazy night
Creeping up the western wave?
Or a peeping foresight have,
O'er the roundness of the world,
Of any thunder-storm upfurled?
If thou hast, 'tis wondrous rare,
For the day is bright and fair;
And thy little eyes must be
Dazed with blue serenity,
In that upper heaven where thou
Never dar'st be high enow;
Whence thy diamond music falls,
Faint and loud at intervals,
Like the intermitting light
From a trembling star by night—
One sweet note, and then a long
Waveless rivulet of song;
Then that note caught up again,
As if thou with sudden strain
Sought'st to gain two steps for one,
Dropped from what thy wings had won.

Fainter, fainter, fainter still!
Oh, till I have had my fill,
Rain thy voluble melody
Down upon me from the sky.

Thou art gone; and this fair day
Now may quickly pass away,
For I was but listening
Unto thee as thou didst sing;
Nor on aught else did bestow
A single loving glance, although
Well I felt the day was fair
With thy music everywhere.

Hark! most surely did I hear
Far off, but for a moment clear,
Half a note dropped gently down;
Yet must I for truth's sake own,
That I may not half believe
What my ears do seem to give;
But that thy mellifluous
Hanging still upon the sense,
In this grassy loneliness
That so lately thou didst bless,
Passeth for reality—
A fresh and recent memory.

But I hear thee, hear thee, hear thee!
As if earth were drawing near thee;
And I now behold thee too
Making circlelets in the blue;
And a new song doest thou sing,
Timing to thy fluttering:
Then dead-heavy, as a stone
Shot from Etna's flaming cone
Dropping on a land afar,
Or more like a falling star
From the sameness of the sky,
Down thou comest wearily:
Only with a gradual swerve,
Cutting out a gentle curve,
Just to come upon thy feet
In amongst the unripened wheat.
And so well I mark the place,
That I might thy cover trace,
Keeping still my eyes there resting,
Find where thou art warmly nesting.

But I leave thee to thy sleep,
And when morning from the deep
Kills the eastern stars, and wan
Grow their brethren every one,
Hither will I come again,
Through the deep grass wet with rain,
Or with heavy summer dew,
Ripping all the meadow through,
Once again to hear thy song
Like the morning fresh and strong,
Flung about so prodigal,
Caring not where it may fall,
Just as if 'twere nothing worth;
Heeding not though all the earth
Sleep unconscious of thy lay,
So that thou canst give away
Joy, which not o'erflowing there
Would become too keen to bear.

Singers are there on the ground
To this tyrant planet bound;
Poets, whose sweet song to hear,
Men forget their daily care;
But like thee they cannot be—
With no selfish vanity—
Some must hear them, 'or they die.'

ECONOMIC PREPARATION OF FOOD.

A short time ago, No. 201, we presented a brief account of the method suggested by Liebig for preparing food economically, and are gratified to find that it has been practically and advantageously put to the test. In a letter written to us by Mr Leach, of Vernon House (a Retreat for Mental Invalids), Breton-Ferry, near Neath, South Wales, the following passages occur:—

'Permit me to thank you for calling attention to the very valuable work of Baron Liebig on animal chemistry. In consequence of reading your paper on the subject, I have had the meat, soup, &c. of this large establishment (about 160 inmates) cooked according to Liebig's directions; the result is, that the waste in cooking is lessened 50 per cent., while the quality of the food is greatly improved. Were all the animal food in the whole kingdom cooked in this manner, an immense national saving would be obtained; and what is even of more importance, the national health would be greatly benefited—thanks to you and Liebig!'

We of course disclaim all title to thanks: we have only performed a duty to the public in disseminating the knowledge of a fact likely to prove generally advantageous.

THE PULQUE OF MEXICO.

The maguey, American aloe—Agave Americana—is cultivated over an extent of country embracing 50,000 square miles. In the city of Mexico alone, the consumption of pulque amounts to the enormous quantity of eleven millions of gallons per annum, and a considerable revenue from its sale is derived by government. The plant attains maturity in a period varying from eight to fourteen years, when it flowers; and it is during the stage of inflorescence only that the saccharine juice is extracted. The central stem which encloses the incipient flower is then cut off near the bottom, and a cavity or basin is discovered, over which the surrounding leaves are drawn close and tied. Into this reservoir the juice distils, which otherwise would have risen to nourish and support the flower. It is removed three or four times during the twenty-four hours, yielding a quantity of liquor varying from a quart to a gallon and a half. The juice is extracted by means of a syphon, made of a species of gourd called *acajote*, one end of which is placed in the liquor, the other in the mouth of a person, who by suction draws up the fluid into the pipe, and deposits it in the bowls he has with him for the purpose. It is then placed in earthen jars, and a little old pulque—madre de pulque—is added, when it soon ferments, and is immediately ready for use. The fermentation occupies two or three days, and when it ceases, the pulque is in fine order. Old pulque has a slightly unpleasant odour; but when fresh, is brisk and sparkling, and the most cooling, refreshing, and delicious drink that ever was invented for thirsty mortal.—*Adventures in Mexico*.

SOCIAL OUTLAWRY.

In almost every ancient and modern state assuming to be civilised, there has sprung up a class of persons deprived of the usual privileges of citizens, and in a sense outlaws. The commission of crimes, or other violations of the law, has of course been in all ages a common cause of expulsion from society; but history and experience too surely demonstrate that misfortune of birth, as in the flagrant case of the Pariah tribes of India, has been a greatly more prevalent source of this monstrous evil. The truth seems to be, that a disposition to do even-handed justice to the whole of its denizens irrespectively, is about the last concession made by any state—such being the force of inveterate prejudice and interest which requires to be overcome. Curiously enough, this dislike of justice is not exclusively or most frequently manifested by nations of a monarchical or aristocratic character. It happens in this, as in some other cases, that the aristocratic in name is perhaps the least aristocratic or exclusive in practice, and that the form of injury and injustice we speak of is most strongly maintained by people who themselves have suffered under a similar oppression. Let us select a few of the more flagrant instances of social outlawry.

Switzerland is reputed to be the *freest* country in Europe. This is an error, arising most likely from the common notion that the country is a confederacy of republics, which wrested its freedom from surrounding despotisms. It is one thing to throw off a foreign yoke, and another to establish internal freedom. Switzerland at the present day, with all its wonderful industry and spirit of liberality in matters of international trade, is, in point of fact, a cluster of little despotisms, the despots in each case being a majority of the population which oppresses the minority—oppression on the score of religion and of birth. Ignorance, and selfishness—which is only a manifestation of ignorance—are conjointly the cause of this discreditable state of affairs. Under the common name of Swiss, three great European races meet and nestle about the heart of the Alps—the French from the west, the German from the north and east, and the Italian from the south; and the want of communication, till of late years, has kept these races apart and ignorant of each other. Nowhere, also, is the distinction of religion more marked. Two-thirds of the Swiss are Protestant, and the remaining one-third Catholic; and the Protestant and Catholic cantons, as the recent civil war has shown, hate each other as the hostile clans in the Highlands hated each other two hundred years ago. Besides, though Switzerland, compared with most countries, is a land of mountains, the greater part of it is composed of plains amidst the stupendous Alps. Two hours' stiff climbing suffices to change from

the neat-trimmed flower-garden and stuccoed cottage of the industrious artisan of Zurich, into the lofty hill-country of Schweitz, where the mountaineer leads a half-vagabond existence, tending his numerous goats among storms and mist, while his children run ragged and barefooted along the road, begging from travellers. Between people so variously situated there can be little sympathy.

A consequence of this national disintegration has been, that the rights of citizenship possessed in one canton have always been good for nothing in another. The citizen of Geneva, who was driven to settle in the Valais, was allowed toleration; but neither he nor his posterity could, by any length of residence, become denizens of their adopted country. A Roman Catholic at Lucerne who turned Protestant, lost all his property, and was liable to banishment; a Protestant at Berne turning Roman Catholic, was punished in like manner. Several of the present cantons continued, up to the time of the French Revolution, to be vassals to the larger ones. Thus the canton of Berne was sovereign lord of the present cantons of Vaud, Uri, and Tessin, which it crushed with taxation, without admitting its subjects to any political rights whatever. Thus, in process of time, it came to pass that all over Switzerland there grew up a distinct body of men, the descendants of individuals who had lost their civil rights in their respective cantons, either in consequence of change of religion, or of misdemeanours for which they were sentenced to banishment, or of illegal marriages, or lastly, as foreigners settled in Switzerland. The stigma thus cast upon the fathers descended upon the children to the last generation. They formed a separate class called *Heimathlosen*—literally, the homeless—people to whom the law allowed nothing—involuntary outlaws. They exist at the present moment in steadily-increasing numbers; and as injustice always reacts on itself, the parties so degraded form an organised body of mendicants, hucksters, pilferers, and often robbers, like the gipsies of other countries, but much more numerous, compact, and formidable to the society which has cast them out.

Some years ago, these *Heimathlosen* were become so troublesome, that their state was forced upon the attention of the Swiss diet, which instituted inquiries accordingly, the result of which is now before us. The report stated the *Heimathlosen* to amount to many thousands in number in all the central cantons, from the Lake of Geneva to the Grisons, beginning at the *Hanenstein* in canton *Soleure* on the west, and extending on the east beyond the Rhine into the Austrian principality of *Lichtenstein*. None of these thousands had any fixed trade, or were allowed by the law to possess a permanent house or lodging. When they ventured into the towns, they assumed, for the time, the characters of

thread-twisters, match-sellers, bird-catchers, and menders of pots and kettles. Whenever they might, they lived by choice in the woods and mountains, supporting themselves by all kinds of thievery. At night, they creep into caves, or sleep round a fire in the open air; and this through the depth of winter. Marriage is unknown among them; none of those examined could tell their own age, and very few knew who were their fathers and mothers. As soon as the children can walk, they are sent into the towns to beg and steal, and bring their plunder at night to the elder vagrants, who remain meantime encamped in the forests. They have still a voluntary government, and their leader at this time was a noted housebreaker named Krušikana, subsequently executed. Wherever and whenever discovered, they are liable to be imprisoned without cause assigned; and formerly, when the prisons were overcrowded, many were executed without even the formality of a trial. They are now, as soon as seized, escorted by troops to the boundaries of the canton, and thrust into the next, by which they are expelled in like manner, unless they can meantime escape. The report recommended various plans for absorbing this unwholesome population, which have been frequently since discussed; but nothing has been done, and the troubled state of the country renders any improvement now less likely than ever.

Vaud was a few years ago the scene of some enormities on the score of religion, and while we now write, intelligence has reached England that the council of state of that canton, which is Presbyterian, has enacted that all religious meetings of parties, not in connexion with the authorised church, are illegal; public worship of all such bodies is accordingly put down by military force, and ministers are in danger of their lives. A more startling instance of the tyranny of a majority over a minority could scarcely be found in modern times.

Let us proceed to another example. The West Indian Islands, during the last century, were troubled with a race of outlaws, whose existence is a curious corollary upon the working of the slave system. In all times and lands, one inevitable consequence of a legalised slavery is the constant tendency among the slaves to escape out of the pale of the society through which they are slaves, and thereby, as it frequently proves, to get beyond all laws whatsoever, the good as well as the bad. The timid suffer; and the bold, if they cannot throw off the yoke, fly from it as far as may be; and thus, by allowing freedom to none, the slave system generates a race of outlaws who subsist by war upon the body which has cast them out. It very rarely happens that a slaveholding country exists side by side with a free one, which may receive the refugee into its bosom, and under the guardianship of its institutions. Slavery, besides, in a productive point of view, is only worth keeping up in a thin population where labour is dear, both from the want of competition and the ease of acquiring land. Among populations like these, the superior land only is tilled; the mountains, marshes, and forests subsist as nature made them, offering a ready refuge and an impregnable fortress in which the fugitives may collect and grow apart.

In the beginning of the eighteenth century, almost every West Indian island had its organised outlaws; hunters and robbers by turns, who, when game failed them, or prompted by revenge, stole into the cultivated flats, fired the canes, drove off the cattle, and often consummated their inroad with the massacre of the planter

and his family. So dreadful a scourge were they, that the early West India records treat of nothing else. In the smaller islands, where the cover was less, they were hunted down and exterminated like so many wild beasts: in the larger, they lasted longer. In all alike they bore the same title of Maroons, which some derive from a native word signifying 'wanderer,' and others from 'marrow,' the Spanish name for the wild hog, on which they principally lived.

There is a very full and curious account of the Jamaica Maroons in the works of Dallas and Bryan Edwards—the one a soldier, and the other a civilian—who look at their subject very differently, yet agree in most of their details. The year 1733 was the end of a lengthy, troublesome warfare, stained with much bloodshed on both sides, in which the damage done by the Maroons was roughly reckoned at £240,000 sterling, besides a loss of from three to four thousand lives. For the next sixty years both parties lived at peace. A large tract was assigned to the Maroons, on which they hunted undisturbed, and where they built three small towns, or rather villages, the chief one called Trelawny Town. It would seem that a very few years of kindness, and attention to the introduction among them of humanising habits, would have sufficed to absorb them peacefully among the free black population; but to take any trouble for a negro, never entered a planter's head in those days. The Maroons lived on hunting, as if in the middle of Africa—a kind of Pariahs, dreaded and neglected; and the planters lived on, heedless of the past and the coming peril, though Trelawny Town was only eighteen miles either way from the principal ports of Falmouth and Mondeggo Bay; and it needed but a three hours' march of the Maroons, as the event proved, to burn down half the sugar plantations in the island.

The slave emancipation act would have effectually dissolved this strange society, by destroying the causes which led to its existence; but it was destined to come to a more speedy and violent end. In 1794, the negro insurrection broke out in St Domingo, and produced a great effect among the blacks throughout the West Indies. In the following year the Maroons were in full revolt. The war which ensued lasted for a year and a half, and cost the island in direct expenditure more than half a million sterling; and all the plantations were burned to ashes. Cultivation was at a stand, the courts of justice were shut up, the whole male white population was drafted into the militia, and the island at large became one entire garrison. We have no intention to go into the details of this miserable conflict. The Maroons were not six hundred in number; the regular infantry employed against them alone amounted to fifteen hundred, with eight thousand militia; but the nature of the country and warfare made this disparity of numbers of little effect. From the precarious life which these savages had led, their powers of sight and hearing were incredibly acute; with their bare feet and hands they could climb trees and cliffs like monkeys; and their aim was deadly: it was a common thing among them to strike a dollar with a bullet at one hundred yards. The whole country was a mass of forest and underwood, impassable except to the Maroons, who cut narrow paths through it known only to themselves, and would crawl for miles on hands and knees through the tracks made by the wild hogs, till, coming to an opening, their unerring muskets picked off our sentries, while the marksman was unseen. Driven at length from their towns, they retreated to a range of narrow glens in the interior, walled in by cliffs two hundred feet high, in which they continued as safe as in a fortress, till the English, by cutting a road, were enabled to bring up their heavy guns, and throw shells with effect from the upper ground, when the Maroons escaped at night through the cordon of troops, broke into small parties, and carried fire and sword through the island.

At last the Assembly, in the month of September,

utterly despairing of success, resorted to an expedient which no extremity could justify: they determined to send to Cuba for bloodhounds. The employment, according to Edwards, to which these dogs are generally put by the Spaniards, is the pursuit of wild bullocks, which they slaughter for the hides; and the great use of the dogs is to drive the cattle from such heights and recesses in the mountainous parts of the country as are least accessible to the hunters. Much opposition was made to the plan, as cruel and dastardly, reviving the worst atrocities of the Spaniards, and disgraceful to the British troops; but at length, on the 14th of December, a commissioner landed at Montego Bay with forty chasseurs, or Spanish hunters, and about a hundred dogs.

When these new allies were landed, the wild and formidable appearance of the men and dogs spread terror through the place. The streets were cleared, the doors were shut, not a negro ventured to stir forth, as the muzzled dogs, ferociously making at every object, and dragging forward the chasseurs, who with heavy rattling chains hardly held them in, proceeded onwards.

Dallas, in his history, gives the following account of their first appearance before the commander-in-chief:—'Anxious to review the chasseurs, General Walpole left headquarters, the morning after they were landed, before daybreak, and arrived in a postchaise at Seven Rivers, accompanied by Colonel Skinner, whom he appointed to conduct the intended attack. Notice of his coming having preceded him, a parade of the chasseurs was ordered, and they were taken to a distance from the house, in order to be advanced when the general alighted. The Spaniards soon appeared at the end of a gentle acclivity, drawn out in a line containing upwards of forty men, with their dogs in front, and muzzled, and held by cotton ropes. On receiving the command "fire," they discharged their guns, and advanced as upon a real attack. This was intended to ascertain what effect would be produced on the dogs if engaged under the fire of the Maroons. The volley was no sooner discharged, than the dogs rushed forward with the greatest fury, amid the shouts of the Spaniards, who were dragged on by them with irresistible fury. Some of the dogs, maddened by the shouts of attack, while held back by the ropes, seized on the stocks of the guns in the hands of their keepers, and tore pieces out of them. Their impetuosity was so great, that they were with difficulty stopped before they reached the general, who found it necessary to get expeditiously into the chaise from which he had alighted; and if the most strenuous exertions had not been made to stop them, they would most certainly have seized upon his horses.'

This scene was well got up, and it had its effect. General Walpole was ordered to advance on the 14th of January following, with his Spanish dogs in the rear. Their fame, however, had reached the Maroons, and the general had penetrated but a short way into the woods, when a supplication for mercy was brought from the enemy, and 260 of them soon after surrendered, on no other condition than a promise of their lives. 'It is pleasing to observe,' adds Edwards, 'that not a drop of blood was spilt after the dogs arrived in the island.' Those who had actually borne arms were soon after transported to Halifax in North America, and ultimately to Sierra Leone, where it is believed their descendants are still to be found. A portion had sided throughout with the English. These have continued a separate people, employed by the authorities as local police, for which their perfect acquaintance with the woods, and capacity of endurance, completely fitted them; but partially civilised, and few in numbers, they differ in little from the rest of the free black population. In the British West Indies, the Maroons may be considered extinct.

France, which assumes to herself the leadership of European civilisation, still upholds slavery in her colonies; but these are too few and scanty to have much effect upon the progress of the emancipation struggle.

The largest of the French West Indian Islands (Guadeloupe) consists, in fact, of two islands, respectively called Grandterre and Guadeloupe, separated by a salt-water channel, some thirty yards broad. Grandterre is flat, cultivated, and thickly peopled, almost clear of wood, and without cover. Guadeloupe is one mass of rugged volcanic mountains, rising steeply from the sea, and rent by subterranean fires. In the midst towers the Soufrière, or Sulphur Mountain, to a height of 5500 feet above the sea, which is constantly smoking. There are ravines and caves enough to hide a dozen armies. The whole island is a maze of thickets, in which Columbus with his sailors were bewildered three centuries ago, and which remain in the same state at present.

Many years ago, a slave ship from Africa, in attempting to beat up to Basseterre harbour, during the hurricane months, came ashore on this coast. The crew took to their boats, and the slaves found no difficulty in knocking off their fetters and hiding themselves in the mountains. Once there, they were safe. Other runaways joined them; the negroes deserted by wholesale; and the united body took the name of Kellers—it is not known from what. The planters, for whom a neighbourhood like this was a continual peril, assembled in force to hunt them down, but did not even succeed in coming in sight of their light-footed foes. The same night the Kellers made a descent on the plain, and set fire to the sugar-canes. The wind was strong, and spread the flame, and nearly a half of the magnificent plantations were reduced to ashes. When daylight came, the incendiaries were invisible. Pursuit was impossible, and it was resolved to treat. A treaty was made accordingly, which, with few exceptions, has been kept steadily to the present time. The Kellers were allowed the free possession of their mountains, and on their side pledged themselves to commit no farther depredations. Matters remain on this footing at the present day. One half the island is populous, richly cultivated, and reflects across the Atlantic the civilisation of France, while the other half is a howling wilderness, in which the persistence of a nation calling itself Christian, in a system forbidden alike by Christianity and common sense, perpetuates on a smaller scale the barbarism of interior Africa, which will here, as in Jamaica, assuredly one day work out its own retribution.

It would be easy to multiply instances of social out-lawry, or at least deprivation of social privilege. The unhappy coloured races throughout the greater part of the American continent offer the more flagrant examples; but others of lesser note haunt our own and other countries. In France, with all its revolutions and code-Napoleons, justice is denied to parties not naturalised; in other words, if one Englishman plunder another Englishman in France, the law admits of no redress. Some years ago, an Englishman who died in France bequeathed his property by will to the Phrenological Society of Edinburgh. The society claimed the money from the trustee, an Englishman in Paris. He resisted payment: the society brought the case into the French courts, and these finally determined that they could not interfere between foreigners! The trustee keeps the property, amounting to several thousand pounds! How different the law of Scotland! A Parisian tradesman sued Charles X. while at Edinburgh, before the Scottish Supreme Court, and the case was determined as if between two British subjects.

It appears to us that the privileges still claimed by royal burghs, and to the *freedom* of which they occasionally admit strangers, is a relic of the past, which it is time should be swept away. It amounts to this—that certain inhabitants, called *burghesses* or *freemen*, claim some kind of superiority of privilege over neighbours less fortunately situated. Think of an advocate of free trade being, by way of compliment to his principles, presented with the *freedom of a city*! If the presenters really love freedom, they ought long since to have de-

nuded themselves of privileges partial in their operation, and which require to be bought or given away. The whole thing is an inconsistency. It is a lingering token of social outlawry.

HANNAH WHITE;

A SKETCH OF IRISH HUMBLE LIFE.

BY THE AUTHOR OF 'MY FATHER THE LAIRD,' &c.

HANNAH WHITE had been for many years the confidential nursery-maid of an officer and his wife, whose fortunes she had faithfully followed into different quarters of the globe. She was an Irish girl; one of an unfortunately numerous class, abandoned from their birth to the care of strangers, called amongst her country-people a 'nurse-child.' Her parents, whom she had never seen, were servants in different gentlemen's families in Dublin. Her mother, on the approach of her hour of delivery, had repaired to the lying-in hospital, where she had been carefully attended for the regulated fortnight, and on leaving which, she had parted with her baby to one of the many healthy young women from the country who crowd the gates of the institution, in the hope of receiving, with the charge of a new-born child, the welcome five pounds, which is to repay them, they fancy at least, tenfold for the additional burden to their family. The little creature was fortunate in her nurse—a decent farmer's wife in the mountains, who had lost her own first baby; and not being worn out with one twelvemonth's cares before undertaking a second of equal fatigue, was able to do justice to her nursing; and having the comfort of a cow, and other land privileges, the home she carried it to was comparatively respectable.

Here Hannah for some years acted the part of an only child—eating as much potatoes and buttermilk as she could conveniently pack within her little sturdy person, sharing at festivals in the dinner of bacon with greens or *calecannon*, and on Sunday mornings having her bit of griddle bread and butter, and her cup of tea; and free at all times to roam the wilds she lived in unconfined. At the end of the first year, her mother made a new bargain with her nurse: three pounds a year was to be the future payment for her board, but there were large promises of advances, and presents, and clothing, a good bundle of which, new and old, some neatly made for the child, the rest useful to the nurse, was readily handed over as earnest. It was the last transaction between the parties. The following year, Hannah's mother could not be found. She had quitted her place, engaged with another family, gone to England, left no traces. The father had never brought himself prominently forward; there was no clue to him. The child was in truth deserted. But the nurse, and indeed her husband also, had become attached to their charge, and they brought back the poor baby to their home and hearts, well knowing they would be never a penny the better for her. Nor did they neglect her after children of their own were born to them. She had her share of what was going, at least after younger pets were served. She was useful among the little crew; and as she grew older, she went the messages, and did the work long, long before her strength was fully equal to it. But she knew that she was a nurse-child, that no money was coming for her, and that she had no right to consider herself as quite a daughter of the house.

When she was about twelve years of age, the comforts of her mountain home became considerably reduced. A season or two of failing crops, the loss of a cow, and the increase of children, were all pressing heavily upon the parents who had adopted her. To replace the cow, her foster-mother determined to take another nurse-child, undeterred by the questionable success of her former attempt in that line: the five pounds in hand was of such importance in the eyes of both wife and husband, that they overlooked all future uncertainty; so a little Biddy, and the highly-valued cow, were added to

the family. The two foster-children very naturally became much attached to each other. Hannah was put in immediate charge of the baby, and as they grew, they still clung together—the little one seeking sympathy, the elder one affording protection, attracted to each other by the indefinable bar which seemed to separate them from the rest. Little Biddy's quarterly payments were made regularly for some time, contributing in no small degree to her wellbeing. They came through the hands of a humble dealer in groceries in the Liberties in Dublin, who acted for invisible parents, and always required the child to be shown to her on these matter-of-business occasions; but at last, on nurse and nursing making their usual visit, the shop was changed, the mistress of it had disappeared—she was bankrupt. A shoemaker was established in the premises, and little Biddy never heard more of her early protector. She did not suffer much from the disappointment. She was a very pretty and a lively child, and none having been born in the house since her babyhood, she remained a sort of pet in it. Poor Hannah had to bear the rubs: early and late the little hardy body worked. Out and in—rain, snow, or wind—Hannah did every one's bidding: she was used to it, and she hardly minded. Her business of messenger took her at least six times a week on errands to the minister's, where she carried butter, eggs, fowl, and such things, and brought back help in sickness, yarn for knitting, and many a bundle of old clothes for the children. It was in this house that she found her friends—made by herself, by her good-humour, her activity, her steadiness, and perhaps her rage; for her scanty raiment, and her bare, red feet, had early attracted the pitying notice of her future mistress. The sister of the minister's wife was married to the officer in whose family Hannah passed her many happy years of service. Under the careful superintendence of these kind masters, she improved quickly in all good qualities, rewarding the pains bestowed upon her by her increased intelligence and ever-anxious zeal for the interests of her kind employers.

She was what is called a middle-aged woman when she returned to Ireland. Her master and mistress had come to settle for their old age in their own country—not near the hills where she was reared. The minister who had been so kind to her in her childhood had removed to a better living, and had engaged a house for his connexions in his new neighbourhood. She had thus for some time back lost traces of her early home. While he had remained in his first glebe, she had often heard of what she called her family; but after he left it, she had received little news of them. All she exactly understood was, that her foster-father had become very feeble, her foster-mother was dead, the children dispersed, and little Biddy married. She determined, however, to look after them all. She had saved money. She was in a way to reflect credit on them—to help them, not to require help from them. She knew that though she had worked hard enough for it, she had always got her share of what was going with them, and she had a grateful remembrance of what had been done for her. Her heart warmed also to poor Biddy, to whom she had often sent substantial marks of affection through the minister. In short, she was resolved to visit the home of her childhood. She set out on a fine autumn morning, on an outside jaunting-car, with her trunk and her carpet-bag, her heavy cloak and her hand-basket, in company with five other travellers, well protected by frieze coats and duffel cloaks from the weather. The day was pleasant, the company sociable, the car not very crazy, nor the horse quite lame. He was changed once or twice upon the road for twin brothers apparently, so like are the individuals of his wretched class. Towards the afternoon, Hannah recognised her former neighbourhood, little changed from what she remembered it: all the great features remained, and all the little ones were as yet indistinct to her. She was set down at the end of a lane leading up to the mountain farm where she was reared. A solitary cabin stood by

the roadside, where she was told she would get help in the transport of her luggage, as it was a sort of house-of-call for wayfarers, in evidence of which a tidy-looking old woman came forward from it, to receive her bag and basket, as also several small parcels consigned to her care by the carman. The old woman's face, though lengthened and sharpened, was familiar to Hannah. She soon recognised the wife of the herd whom she remembered in the service of her early friend the minister, one of whose last kind acts, before leaving the district, had been to establish this old couple in a small cabin, with a bit of potato garden attached to it, the rent of which he paid for them to the gentleman in whose shrubberies the old man worked. They were decent and industrious, and so more comfortable than many could have contrived to be in their station. The old woman gave Hannah a most cordial 'welcome home,' putting on the kettle in preparation for the cup of tea, which is the usual refreshment offered where both parties are above a certain humble grade.

Much conversation passed of course upon the topics naturally interesting both to guest and hostess. Hannah mentioned her intention of seeking out her foster-mother's family, of visiting her foster-father at his little farm, but first establishing herself with Biddy, whose cabin she meant to make her abode while remaining in the country. The old woman heard her very quietly. For an off-handed people, as they are said to be, it is singular how very cautious the Irish are in committing themselves by advice, or opinion, or information. She replied dryly, that the morrow would be time enough for the walk to the hill farm: as it was some miles off, and the night coming on, her visitor had best take her bed where she was; she would find it clean, and she would be obliging an old friend; and as she had a fortnight's leave, there was no need to hurry. But Biddy was at no great distance, Hannah said. Biddy, she knew, lived in the village close at hand, on the road to the bog, a little piece beyond the turn at the end of the lane, convenient to the old highway. She must go on at once to Biddy: she would take her basket with her, leave her cloak and bag, and send Biddy's husband up for them and her trunk either that night or the next morning. The old woman merely coughed, promised to take all care of the luggage left with her; and seeing her friend determined on proceeding to the village, offered no farther discussions, only adding, as she bade her 'God speed,' that if she found Biddy had no way of putting her up comfortably, she hoped she would return where she would be certain of the best of welcomes. Hannah bade the old woman a kind farewell, and set out, walking briskly down the lane, every object she encountered beginning to return to her faithful recollection with a familiarity almost unbroken. At the turn, she came, as she expected, within sight of the village. A strange collection of hovels it appeared to her now; and as she approached it, the street looked dirtier, the cottages more ruinous, the air of desolation more apparent. The cabins were principally built of mud, and had been whitewashed at some time or other, thatched at an equally uncertain period either with straw or rushes, overgrown now by moss, and grass, and various lichens, and in sad need in many places of repair. Windows were some built up, some half-filled up; others with only a broken shutter to the opening where a window should have been; while in some walls any means for the admittance of light had been altogether forgotten. Doors were such as suited the style of windows; doorways were in perfect keeping with the condition of the road they bordered; heaps of manure lay beside each threshold; fowl, and pigs, and dirty children lay about, or wandered amongst the filthy riches of the place; and as Hannah walked along, a dirty cap, over bronzed features and matted hair, peeped at her from every wretched dwelling, in wonder at the decent stranger. Her heart sank within her: Biddy reduced to this: she felt unwilling to ask for her amidst such evidences of misery. A stone-and-

lime house, neatly thatched, and newly whitewashed, encouraged her a little; she stopped at the door to make inquiries, and seeing a decent-looking woman in the act of filling a trough, just *inside* her door, with potato peelings for her pig, she half hoped to recognise the features of her foster-sister, as the woman raised her head to reply—'Is it Larry* Quin's? Sure he has no cabin: it's only lodging he is in a little room at Luke Brady's, on the side of the big pool there beyant, as ye turn to go on to the chapel: he has the kitchen part: that cabin there with the big stone again' the chimley wall.'

Hannah walked on along the road to the big pool, round the corner of the muddy pond, over to the house she had been directed to; several children were within, seated quietly on the mud floor, dabbling with hands and feet in the dirt around them. She stood a moment to pick her way through the offensive draining from the dung-heap against the wall, by means of two or three large stones placed for the purpose.

'God save all here!' said she on stooping to enter, for she had not in all her travels forgotten the touching salutation of her country. 'Whose house is this?' asked she: she could not bring herself to frame her question more assuredly.

'Larry Quin's,' cried a quick, sharp voice from beside a wooden cradle, which the speaker, a lanky boy of eight years old or so, was rocking lazily.

'Larry Quin's!' repeated Hannah. 'Is he your father?'

'He is,' screamed the lanky boy.

'Where is your mother?'

'Gone to the well for a sup of water to bile the praties.'

'Where's your father?'

'Binding there above at Bryan Casey's, on the commons, where he does be working.'

Hannah looked round: seat there was none; light very little; bare walls, smoky rafters, a wet clay floor; fire, furniture, all wanting; no bed. A large pot, two broken teacups on the window sill, a tin teapot, and three or four tin porringers, were all that she could discover in the room, except the five half-naked and very dirty children. The old woman's cautious cough recurred to her. It seemed very likely that she should not find her foster-sister in a way to put her up comfortably.

'Get out o' that now, at wanst!' said rather a coarse voice outside to the little dirty squad that blockaded the doorway; and in a second the naked feet of the mistress of this Irish labourer's home appeared inside the threshold.

Biddy Quin was a young and very handsome woman. She would have excited general admiration could her person have been seen to advantage in decent clothing, and her features have been distinguished instead of being concealed by dirt. Even as she was, tattered, and soiled, and careworn, at a distance, with her piggish water on her head, the natural grace of her figure would have delighted a painter. But to tidy Hannah, in her clean gown and spotless shawl, the near approach of any being so little familiar with the use of soap gave any feeling but one of pleasure. The recognition was therefore a different sort of scene from what had been expected. Hannah was almost as much annoyed as she was distressed. Her manner was reserved in consequence. Biddy showed some surprise; a little mortification; not any particular affection; while there was a sort of hope in her look and her voice, and her words even, of benefit to be reaped from this visit of her foster-sister, which, though natural in their circumstances, and indeed prepared for as well as expected, jarred somewhat against the feelings of the presumed benefactor.

After a few introductory exclamations, a little nervous chiding of the children, and many blessings scattered

over the world at large, and on Hannah in particular—'I am greatly tоссicated to-day, Hannah, honey,' proceeded Mrs Quin, seating herself, baby in lap, on a slab of stone that ran along against the wall inside of the large chimney. 'Them childer keeps me for ever on the fret; my heart's a'most broke with them—strivin' to keep the life in them, and to gather a bit of firing—and has just the praties an' a sup of milk at odd times according as I can rache on it. Jim, fetch the stool out from under the straw there for your aunty—she'll be a good one to you. That's our bed, Hannah, jewel,' continued Biddy, pointing to a bundle of straw that was heaped up in a corner; 'and that's our blanket,' taking up the end of a long black-looking rag, which had been doubled up over the baby.

Hannah searched for a clean, that is, a dry spot, on which to place the stool which had been produced for her; and finding the neighbourhood of the hearth looked best, she there seated herself, carefully drawing up her gown, and gathering her petticoats so close round about her, that as little of the hems rested on the clay floor as might be. Her reply to her foster-sister consisted of a string of questions concerning the absence of such necessary articles of plain furniture as she had hitherto been used to consider indispensable to the poorest household.

'Bedstead!' exclaimed Biddy; 'orra one—bed, nor bedstead, nor bedclothes, nor an individual happ'orth of one thing nor another owns this, but just what you see: nor manes to get one.'—'Small rint! bedad, and it's sixpence a week we should pay for these four bare walls, an' they falling, an' glad to get it: sure cabins' scarce, lodgin's itself hard to meet with these times.'—'Arn! an' what signifies his arnin'?'—'fivepence a-day, an' diet! Hannah, jewel, it's a folly to talk: take the tobaccy out o' that, an' it's little comes to our share whin the rint's paid. He *does* smoke, then, now an' agin,' continued she; 'but,' she added in a tone of decision, a little proud and a little sulky, 'he don't drink—orra a drop.'

There is no need to continue the conversation between the prosperous and the destitute foster-sisters. Hannah ascertained that the misery of Biddy and her husband was extreme; that he lazily served a hard master, and had little wish to occupy his spare hours in any extra work that would benefit his family, generally throwing himself down upon the straw when he returned from his day's labour, after the coarse but plentiful supper he had been supplied with by the farmer. On the wife fell the burden of providing for the wants of the family—all that she and her children required beyond the potatoes, which indeed formed almost their only food. To use her own expressive phrase, she seldom had the 'handling of a shilling.' The few pence her eggs procured her was all the coin that ordinarily 'came her way.' Her housekeeping consisted in running here for milk, or salt, or soap, and there for firing, tearing her ragged petticoat into still longer tatters while grubbing among the furze hedges for the green prickly whins that filled the house with smoke while heating the potful of potatoes. The husband's earning was nearly absorbed by the potato rent, which was managed for him by his master, on what is called the con-acre system—seed, and tillage, and ground, set against his labour and the 'trifle' of manure collected at his cabin door. If there were as much over as provided him with shoes and a new suit, hat included, once in two years, he was fortunate: for all else they depended on the pig and the few hens Hannah had on her first survey overlooked, perched over her head on the rafters. To attain anything like comfort from such elements of bare subsistence, would have been beyond the powers of a better manager than poor Biddy, who, a spoiled and idle child, had married to please herself against the advice of all who were interested in her. Unable to struggle with her poverty, she had completely sunk under it, consoling herself, young as she was, with 'a blast of the pipe' she saw so necessary to all around her. This Hannah heard from her old

woman, to whose tidy cabin she returned to pass the night, after leaving with her foster-sister what would procure for her and her children a better supper than they often ate. Biddy received the money with many thanks, but no surprise, remarking, too, that Hannah 'need hardly be troubling herself: Mrs Riley, good luck to her! was a very good one to give score whin there was any reasonable dependence for repayment.'

The introduction next day to the husband was as little satisfactory as had been the interview with the wife. Larry Quin had a 'jaunty' air; he was a good-looking, stout-made man, with his old hat set on one side, his ragged coat flying open, and a straw in his mouth, which he twisted in all directions while vapouring on with a torrent of apologies for his household deficiencies. He 'had been intending to git a little dresser;' and he 'had laid out to procure an iligant bedstead,' that had belonged to somebody, and been for sale at some time; and he 'was determined, please God to lave him his health, to do' all that was sight and desirable at some indefinite period. But 'being in lodgin's, and greatly tоссicated this while back by'—in plain truth, neither the will nor the way to do better, there he was to the full as spiritless as the wife—almost contented with his low condition. 'In regard of the little pig, too,' he had never happened to have been without one before. 'It chanced, very unlucky,' that a friend should happen to come just when they were worst prepared to receive her; but, 'with the blessing of God and *Aer Aehy*, things would soon be better than ever with them;' and very easily, for, by the old woman's account, things had never been very well.

Larry was a nurse-child too; abandoned, like the rest of this unhappy class, by his natural protectors, and thrown upon the charity of his foster-parents as soon as habit was supposed to have endeared him to them. Though not much worse used than the rest of the children, he grew up fully conscious that he had no legal claim to the affection of those who had reared him; that he had no right to look for careful tendance; to murmur at privations shared unequally by him, with extra labours, and sometimes cruel words. He early felt that he belonged to nobody, and he soon began to act as if nobody belonged to him. To live, therefore, for himself alone became his rule of conduct. Without a hope, without an aim, without a tie, till he fell in love with Biddy, what had he to care for in a world to him so cold? Naturally of a lively temper, his position made him neither sad nor sulky—merely reckless. He was noted as a pleasant companion, but he had no reputation as a steady workman. He had therefore never kept his place as a labourer with the gentry or the larger farmers, who could afford to pay him a sitting hire. Instead of tenpence or a shilling a day, with perhaps a house and bit of ground, milk at times, help in fuel, with many useful occasional presents from the ladies of such superior families, to say nothing of a kind superintendence, maybe of more consequence to a servant's well-doing than all the rest, he had been obliged to content himself with jobbing at busy seasons, or serving the little farmers, who, hardly able themselves to pay their rent, and meet their current expenses, make the hardest possible bargain with their unhappy labourers. They give the lowest wages—as little as they can contrive in cash, and the commonest of frugal diet. It is, however, the certainty of this diet that insures the unfailing supply of strong bodies, able for better things. The husband, thus secure of victuals, is content to let the wife and children make it out as they best can at home; seldom without food, indeed, but rarely able to supply themselves with any other necessaries, neither parent seeming ever to have a thought how they were to manage to bring up their children. 'Should the potatoes fail!' This passed often through careful Hannah's mind, but never through her foster-sister's. The present was enough for Biddy, and all she seemed to heed in that was food in plenty—the best she could get, whatever her means were. Satisfied

with the large quantity she deemed sufficient of the cheapest fare, she could not resist expensive provisions when she had the money in her hand to buy them. Perhaps, had she had more experience in the laying of it out—understood its value better—she would better have comprehended the worth of what it could procure her. As it was, to save for another day, or for clothes, or for fuel, or for furniture, was quite beyond her powers of control over the little sum her foster-sister had given her. While it lasted, tea, sugar, white bread, butter, herrings, bacon, were lavished upon herself and on her children, among whom, sharing in all the vicissitudes of this miserable family, there was actually another abandoned nurse-child. The present thus provided for, Biddy contentedly resigned the future to fate, or luck rather, to which she quietly attributed every event of her life.

Hannah found that to trust to such a character for any family improvements was altogether out of the question. Whatever was to be done for them, must be done by herself, as she should judge best for their future comfort. She, with a little trouble, got the husband, who was much more manageable than the wife, to remove the manure to the end of the cabin, fill up the gutter with stones, and spread some gravel before the door. She mended the thatch, dashed the walls within and without, glazed the window, levelled the floor, purchased a few articles of common furniture, washed, and mended, and made clothing essential to decency. Biddy was delighted, but she could not help—her habit of wandering about for water, and for furze for firing, and for milk, was so inveterate; the many gossiping meetings with her numerous acquaintance, who were all abroad on the same errands, appeared to be so necessary to her getting through the day, that Hannah could never keep her ten minutes together at any regular work. Then she had nothing to do anything with—no more had her neighbours. A system of lending and borrowing pervaded the village, completely defying the attempt to make any individual family independent or comfortable. There was but one pair of scissors in the whole row of houses to which Larry Quin's belonged. When one neighbour had a washing, she borrowed her tub here, her smoothing-iron there, and, in Biddy's case, her table elsewhere. Very few had an even set of knitting-wires; they were eternally bartering an odd thick one against an equally odd slender one. Even their wardrobes seemed to be in common. The possessor of a decent cloak very seldom had it much at home; any one in want of respectable covering for some extraordinary occasion 'borrowed the loan of it' without ceremony. Bonnets, gowns, shawls, all seemed to be public property. Any effort, then, to raise the condition of one amongst the set must fail, unless the whole could be simultaneously supplied with an equal amount of property. And how, or where, to begin, would have been a problem difficult to solve by more reflecting heads than Hannah's. The village had no liege lord; it straggled over 'three lairds' lands'—'bonnet lairds,' too, very nearly. A few cabins on this holding, a few on that, mere patches, all of them belonging to those who had never set foot on the sod within the memory of the oldest inhabitant. The little farmers who rented these neglected fields had, for L.1 in hand, permitted any one to erect a hovel anywhere; for which shoddy—when built, like beavers' dams, with mud and sticks—they exacted an annual rent; not according to the value of the dwelling, but according to the means of payment possessed by the dweller. He, again, in a troubled time, to meet his rent, sacrificed one room to a lodger. The lodger, for the same reason, frequently let his corners; and thus these most destitute creatures struggled on through a life of little enjoyment, yearly adding to the sum of wretchedness, unequal to the attempt of improving their condition—many of them, indeed, unconscious of their degradation. With the wasteful habits common to the miserable, the scanty means they had they squandered. They boiled many

more potatoes than even their large appetites required, throwing out the remainder to the pig and fowl. An overplus of buttermilk was even sometimes thus disposed of. Truly they 'took little thought for the morrow.' The pig, however, fattened, and in due time was sold, and the money he brought procured one of his lean brethren, and cleared scores with the huckster, the decent woman, the Widow Riley, owner of the only respectable-looking house. There was generally a long arrear to settle with her, for the borrowing system was extensively pursued in all its branches. How Biddy had carried on matters with her was a marvel, for she was no manager, had seldom made much of her pig, and had often been without one. The begging system had hitherto relieved her. She had trusted to remittances from her foster-sister, or to help from her foster-father, who had never quite cast her off, though she had married so much to displease him.

Little effectual relief could be given to a pair so reckless, so indolent, so low in feelings, as Larry and Biddy Quin. All that it was possible to do Hannah did. She made the possession of a pig a certainty, arranging with her friend, the old herd, that twice every year a store-pig should be bought for them, the proceeds of which, unencumbered by any claim, Biddy was to have to spend as pleased her. For this generous gift both husband and wife overwhelmed her with gratitude; the blessings of Heaven were called down plentifully upon her; yet each had a trifling favour to ask in addition—'A grain of tea, now and again, or a taste of sugar, or any old rag of covering that was past another body's wearing,' was the modest request of Biddy, while Larry put in for 'the next cast shute of the general's.'

Thus ended Hannah's dream of comfort in little Biddy and her husband; one pair out of thousands similarly circumstanced, equally ignorant and helpless, who, now that the days of pigs and potatoes are done, have been crushed down into the mass of utter pauperism by which the sister island is overwhelmed. Can we lament over the sum the 'three lairds' have to pay in poor-rates?

Next week we shall show the results of her experience in another department of the microcosm of Irish life.

OKEN'S PHYSIOPHILOSOPHY.*

PHYSIOPHILOSOPHY is the name for what is otherwise more familiarly called the philosophy of matter, as distinguished from the philosophy of mind: it comprehends the whole system of our knowledge of the material universe—heavenly bodies, earth, minerals, vegetables, animals, man—up to the confines of the human soul, which is the starting-point of a new circle of subjects, such as metaphysics, logic, rhetoric, ethics, and theology. The reader is aware that the different departments of material nature have given birth to a number of distinct sciences; and that, in the present day, each of these is so extensive, as to occupy large and voluminous treatises, and to require years of study to be completely mastered. Thus mathematics, astronomy, physics or natural philosophy, chemistry, physiology, and anatomy, the various branches of natural history, geography, and many other sciences growing out of these, contain individually such a mass of important truths, so many explanations of natural appearances, and so wide a range of practical applications, that no small labour is required to grasp completely any one of them; and it is generally reckoned enough for a single book to concern itself with only one, or even a fraction of one, at a time. But now and then works are published with the view of grasping the whole at once, or of exhibiting the most concentrated essence of each in connection with the essences of all the rest, forming a

* Elements of Physiophilosophy. By Lorenz Oken, M.D., Professor of Natural History at the University of Zurich, &c. &c. From the German, by Alfred Tulk, Member of the Royal College of Surgeons of England. Printed for the Ray Society, 1847.

world-science, or a comprehensive survey of the entire universe. Such productions have a distinct value of their own when competently executed. They have this peculiar fascination, that they embrace a vast and imposing subject; they are to other books what a mountain prospect is to a cabinet of minerals, or a case of birds. The author speaks little in proportion to the greatness and extent of his subject matter; he has the advantage of a modest position; by the nature of his enterprise, he is compelled into the virtue of suggesting many ideas by few words.

But if the position of such an author is in one respect modest, his pretensions are not always so. There is a temptation to hazard explanations of obscure phenomena at a venture, or by a stroke of fancy, instead of pursuing the laborious process of studying each point in detail, and at the expense of multiplied observations, experiments, and reasonings. It is so delightful to grasp the whole universe in thought, or to possess ourselves of the laws of its most hidden workings, that human nature must be excused for prematurely making the attempt. It is quite true that no ideas which we possess at the present day can comprehend the whole processes of vegetable and animal life; and, moreover, these mysteries may not be unriddled when the whole generation of living men shall have passed away. But we are not, for that reason, to be prohibited from running over our chain of connection through the departments of nature, and of forming our own conception of the unity that prevails in the world. There is a certain license of speculation or imagination allowable, before the consummation of that perfect knowledge which is to mark out the latter-day glory of the human reason. This is the justification of the theories of the universe, formed in all ages to suit an irrepressible craving in the mind of man to view the world in unity, or as a compact and connected whole.

Oken's 'Physiophilosophy' is an attempt to relate the various sciences to each other, and to reduce the whole of nature to a very few simple principles. It has been translated and printed in this country by the Ray Society, which was formed for the purpose of diffusing rare works on natural history. This fact shows at once what is the real value of Oken's book, although it does not indicate the limits of the field over which he ranges. Professing to expound the first principles of all the sciences, and to advance new and comprehensive doctrines in each, his success is strictly confined within the subjects of the vegetable and animal kingdom. As a naturalist, he is great and original; if he had only known to stop there, the feelings excited in his readers would have been very different from what they are. Preachers and lecturers have sometimes remarked, that by cutting out a part of a discourse, they improved all the rest. Never would this maxim have been so well applied as in the present work. The first hundred and fifty pages—which are devoted to the inorganic world, or to the subjects of mathematics, astronomy, motion, gravity, light, ether, mineralogy, and geology—present a succession of absurdities, extravagance, and wild day-dreams, that could scarcely be matched anywhere out of Bedlam. Something approaching to the author's treatment of these subjects may perhaps be found in the earliest speculations of the Greeks, or in the cosmogony of the Hindoos. But there are few sane men in modern ages, still less men of powerful intellect and extensive knowledge, that have allowed themselves to publish to the world such a bewildering tissue of night and chaos.

The doctrines that Professor Oken thinks self-evident and unimpeachable, are often made of very surprising stuff. Take, as the first example, his idea of certainty itself. 'If anything be certain, it can only be *one* in number:' or this, 'the whole science of mathematics depends upon zero (a mathematical name for "nothing" in the sense of the commencement of a series); consequently, mathematics is based upon nothing.' But nothing being eternal, the principle of mathematics is

therefore eternal. In short, 'the Eternal is one and the same with the zero of mathematics.' 'The Eternal is the *nothing* of Nature. As the whole of mathematics emerges out of zero, so must everything which is a singular have emerged from the Eternal, or nothing of Nature.' Now, by the creation of mathematics in this simple way out of a very narrow original, a great step is gained, and the rest of creation is comparatively easy. For mathematics includes length, breadth, space, solidity, circles, and spheres, with numbers, and all that they handle; and thus, by the first act of creation, a considerable stock of things is produced to begin with. For instance, what is man but 'the whole of arithmetic compacted out of all numbers,' whereby 'he can produce numbers out of himself?' Again, a vast deal may be made out of the sphere: 'God manifesting is an infinite sphere. The sphere, therefore, is the most perfect form; for it is the primary, the divine form. Angular forms are imperfect. The more spherical a thing is in form, by so much the more perfect and divine is it. The inorganic is angular, the organic is spherical.' Unfortunately, however, for Professor Oken's originality, this is the very doctrine of Aristotle, which was so thoroughly ridiculed by Galileo in the seventeenth century, that it was thought to have been obliged to hide its head from that day forthwith. Most readers know the basis of the fictions of cycles and epicycles for the planetary motions that were maintained in the middle ages, till they were destroyed by Galileo, Kepler, and their contemporaries: it was no other than this—that such dignified bodies as the planets could move only in *perfect* figures: that is to say, *circles*; there being no other form perfect but the circular.

But to pass from the subject of mathematics, it may be interesting to hear the professor's account of some of the physical agencies. Take, therefore, the following sketch of electricity, which is related to the spherical form in this manner:—'Electricity is a merely peripheric antagonism, without centre, thus without union: an eternally disintegrated without rest.' As to gravity: 'Gravity is a weighty nothing, a heavy essence, ~~striking~~ ing to a centre; a realisation of the first divine idea.' The reader is also welcome to the following very simple explanation of perhaps the greatest mystery in nature—the constitution of the sun. 'The sun can never be extinguished, never become dark; for it gives out light, not as fire, but *simply by reason of standing in the midst*; its simple position, its enchainment to the planets, is light.'

As he advances into other regions, the professor prepares fresh surprises for the reader, whom, however, we must refer to the work itself for the demonstration of such propositions as, that 'self-consciousness is a living ellipse'; 'the earth is an oxyde of carbon'; 'the mean tension of ether, or light mingled with darkness, is called *colour*.' 'Red is fire, love—Father: *blue* is air, truth, and belief—Son: *green* is water, formation, hope—Ghost. These are the three cardinal virtues. Yellow is earth, the immovable, inexorable, falsity the only vice—Satan. There are three virtues, but only one vice.'

All this madness has its method. It is easy to discover the ruling principles of Oken's intellect: we see in it great native power running into a wild profusion of analogies, which are restrained by no law or motive, or maxim of sound thinking. There are certain common ideas that he carries out into every region of thought, without examining whether nature herself has really employed them to such an extent. For example, the notions of point, line, surface, solid, have a very great range of application; but with all their range, it is possible to find things to which they do not apply. Thus, who but our author could define and discriminate the four forces of crystallisation, magnetism, electricism, chemism, by saying that the first is *point*, the second *line*, the third *surface*, the fourth *cube*? There would be about as much propriety in expounding our political constitution as containing the sovereign, which is a point; the House of Lords, or a line; the House of Commons, or a surface;

the ten-pound electors, or a solid. The professor, in like manner, is never done with applying the sun and planet relation; and the idea of combustion in his hands elucidates an infinity of things. But perhaps the stock idea of the book is the four elements—earth, water, air, fire; withdraw these from the fabric, and it would crumble into fragments. Now, the distinction of the four elements has been shown by modern science to be accidental, and not fundamental. The three states of matter are distinguished by nothing but the possession of more or less heat, and the physical and chemical laws apply alike to solids, liquids, and gases.

The introduction to the biology is not encouraging. 'Galvanism is the principle of life.' Every part of organised beings is formed from mucus; and 'the primary mucus is the sea mucus.' Accordingly, the creation of organised beings takes place as follows (there being water and light to begin with):—'*Light shines upon the water, and it is salted; light shines upon the salt sea, and, it lives.*' 'Man also is a child of the warm and shallow parts of the sea in the neighbourhood of the land.'

The four elements are our author's key to all mysteries; behold how they serve to divide the animal organism! 1. The nutrient, earth; 2. The digestive, water; 3. The respiring, air; 4. The motive, fire. 'It is impossible for more than these to be developed in an organism; impossible for anything else but what is in nature to originate therein; impossible that anything new be born by it. How could,' exclaims the professor with warmth, 'the organism be aught else—how aught else than the focus of the four elements?' When, however, we come to the structure of plants and animals, his fertile analogical genius suggests many very striking comparisons between the different parts of the organisms; and probably in a good many cases he is right in his suppositions. If he is correct, at an average, once in every five analogies (and we do not say he is not), his book is probably the most original work on natural history that has appeared for half a century. We shall present the reader with a few specimens of these ingenious comparisons.

In plants, he says, 'the leaf is the table of contents or index of the stem.' And he goes on to show how the varieties of leaf-structure are uniformly accompanied with corresponding varieties in the stem-structure, thus indicating a unity of organism throughout the plant. And the flower, in like manner, he considers as originating out of the leaf. The whole of the development of this idea, as he goes through the various tribes of plants, is very interesting, and contains a great deal of probability. Still, the reader must lay his account with such declarations as the following:—'In impregnation, the heaven is married to the earth; for then the spirit descends, and does not esteem itself too highly to become flesh.'

In order to come at a few of the suggestive comparisons that the professor makes in the animal system, we must pass over a good deal of this character: 'The animal is a whole solar system, the plant only a planet.' In comparing the animal with the plant in detail, he remarks that the *lung* is analogous to the *leaves*; and the likeness undoubtedly holds in many points; but according to his logic, 'this is sufficient ground for assuming also the parallelism of the other organs;' which therefore he boldly carries out.

Within the animal system itself, the professor suggested one analogy, which has had the good fortune to be proved by Professor Owen—namely, that the bones of the head are an expansion of four vertebrae; so that the head, although not identical with, is analogous to, a portion of the trunk. He follows out the similarity in the detail as follows:—

'If the bones of the head are the repetition of those of the trunk, so also must the flesh of the head be a repetition of that of the trunk. Pectoral and abdominal muscles are ennobled in the muscles of the face.

'The face must have been principally formed by the orifice of the intestine—the mouth, and by the opening

of the lungs—the nose, and by the apex of the vascular system—the members which are repeated in the jaws. The mouth is the stomach in the head; the nose, the lung; the jaws, the arms and feet.

'The salivary glands are the liver in the head, as the mouth is its stomach. The liver, which was originally also symmetrical in form, has become wholly symmetric in the higher organised head, and forms two glands.

'The tongue is the oesophagus elongated upon the anterior side, because in front there is more flesh. The tongue is the extremity of the intestine converted into muscle.

'The nose includes pectoral muscles, the mouth includes the muscles of the limbs.

'If pectoral and abdominal muscles are repeated in the face, so also must the anterior bones, ribs, and limbs be repeated. It will be shown that the nose is a vertebra, the jaws members, and their muscles those of the limbs. The brain is the spinal marrow; the skull, the vertebral column; the mouth, intestine and abdomen; the nose, lung and thorax; the jaws are members. The whole osseous system is nothing but a vertebra repeated.'

Then, with regard to the muscular system in general, Oken gives the *heart* as the prototype. 'An entire layer of flexors and extensors is the pattern of the heart;' even a bone is an ossified heart.

Another of the professor's analogies that has been admitted to be successful, is the comparison of the *wings of insects*; not to the wings of birds, but to the *lungs* of the mammalia. Although their mechanical use is the same as that of the birds' wings, their structure and functions in supporting the system refer to the aëration of the blood. His explanation of epidermis or outer skin, nails, hairs, and feathers, relates them all to the branching filaments of the lungs.

The ribs are the bony envelope of the lungs: and arms and legs are considered as expanded ribs. The professor becomes very touching on this head. 'The arms, when clasped together by the fingers, are a thorax without viscera, without heart and lungs. They are destined to enclose a whole body in the embrace.' 'By an embrace, that which has been embraced has been made our *vicus*; it has been adopted as our animal heart, and as our animal vital organ—our lung. The embrace has an exalted physiological signification, and precisely that which it unconsciously possesses in the state of pure love. Nature always thinks more nobly than we do. We follow her beautiful regulations, and she rejoices in the sport.'

The head being reckoned analogous to a portion of the trunk, the jaw corresponds to the limbs. 'Each jaw consists of the same bony divisions as the limbs of the trunk, of scapula, humerus, and forearm; or of pelvis, femur, and tibia. This is easy to be demonstrated in birds, reptiles, and fishes. The digits are repeated in the teeth. The teeth are claws.' Again, the movements of the muscles of the face correspond to the movements of the muscles of the limbs. 'Upon this depends the interpretation of dumb-show, or the art of physiognomy.' 'The oral cavity also consists, properly speaking, of mere tactile organs, which have been repeated in the head. Thus there are tactile organs which are subservient to the gustatory sense, in biting, chewing, and swallowing.'

This theory of the analogy of head and trunk serves to explain the well-known fact of the tendency of all the members of the body to act together, and in the same way. The child's movements involve legs, arms, and face in one kind of motion; and it demands express training to make an arm move one way and the leg in some different way at the same instant, just as it requires training to make the two hands perform different processes at once. According to Oken, there is the same foundation in the animal system for the concurring motions of head, arms, and legs, as for the simultaneous action of a pair of limbs. 'Sympathy is the result of parallel systems.'

With all the merits that there may be in the latter portions of this book, we hope we shall never meet its like again. It is lamentable to see a man of so much mental grasp utterly destitute of the power of distinguishing between truth and falsehood. Professor Oken never seems to have adverted to the possibility of starting a hypothesis not strictly in accordance with nature in all its details: the process of verification has never occurred to him as either necessary or useful. Upon everything he gives us the first thoughts of an inaccurate thinker. One would suppose that he felt himself called upon, within his own lifetime, to explain all nature somehow; so that, above all things, it was needful for him to get on. Except in natural history, his actual knowledge of science is very trifling; his grand analogies in physics and chemistry could not have occurred to a mind knowing the facts. Even his valuable suggestions rarely amount to discoveries. For one thing, they are never proved; and the discoverer of a truth is, properly speaking, the man that proves it, and shows its full range and meaning. Gross injustice is often committed by people who find in old books something like the statement of a truth that has been established by scientific investigation, and on that ground ascribe the merit to a man in whose hands the doctrine was a dead letter. A loose talker, like Oken, will hit upon a truth, and rest it upon such flimsy reasons, and put it in such bad company, that the world takes no heed of it, till it is again announced by somebody that has laboriously wrought it out, and settled it for ever upon adequate evidence. The ravings of a madman, or the revelations of a clairvoyant, may contain new truths, but mankind can never learn them from such sources. Truth must always bring its authority with it: by its evidence do we know it. A well-informed man may gain much by reading such a book as the 'Physiophilosophy'; by his knowledge he will distinguish what is absurd, and sometimes he will be able to supply to what is true the needful demonstration; but the world at large can believe nothing that is said in it from beginning to end, till it first passes through more trustworthy hands.

WALKS TO OFFICE.

LEO TO CAPRICORNUS.

NOTWITHSTANDING the noise, dirt, and discomforts of London, there are thousands of its population who prefer it to all other places. We have known some of these town-worshippers: when, after much deliberation, they visit a country friend, they are always miserable until they get back again. Charles Lamb, who

—'Ranged the crowded streets
With a keen eye,'

affords a memorable instance of love of urban life, amounting almost to a devout feeling. We have another example in Dr Johnson: his attachment to London breaks out in many parts of his writings. In one place he says: 'The happiness of London is not to be conceived but by those who have been in it. I will venture to say there is more learning and science within the circumference of ten miles from where we now sit, than in all the rest of the kingdom.' And Davy, speaking of the Metropolis, observes: 'It was to me as the grand theatre of intellectual activity, the field of every species of enterprise and exertion, the metropolis of the world of business, thought, and action. . . . There society of the most refined kind offered daily its banquets to the mind, with such variety, that satiety had no place in them, and new objects of interest and ambition were constantly exciting attention, either in politics, literature, or science.' To multitudes, however, London is a place to be inhabited only from necessity, which compels them to a weary and monotonous course of task-work. How many of those you meet during a walk to office are mere machines, who have outlived all desire to go and look upon a green field! Their holidays are

spent in lounging at the corners of streets, or in the dingy parlours of out-of-the-way taverns. Stand for a few minutes on any one of the bridges, and watch the human tide as it goes by. You shall see objects of misery such as can be seen nowhere but in London. Not mere penury or destitution, but hopeless misery, that stamps a wolfish expression on the victim's features, and kindles a fiery madness in the eyes. They move with the throng, but are not of it. Notice, too, how some men's trade tells upon their physical constitution: the one now approaching, with one shoulder higher than the other, head inclining a little to the right, the left hand always carried in advance, while the right, with bent fingers, is held back—he is a filer in some engine factory. The next, in threadbare coat, with a slight stoop, curved legs, slouching gait, and right arm swinging in uneasy jerks—is a tailor: you cannot mistake him. Here is another with a dirty canvas apron twisted round his waist; he takes long, slow steps, and turns in his left foot—he is a cabinet-maker: and in the same way might we go on reading off each one's calling or character for a whole day. The peculiar expression, however, varies in different quarters of the town. 'Let any one,' says the Tatler, 'even below the skill of an astrologer, behold the turn of faces he meets as soon as he passes Chesapeake Conduit, and you see a deep attention and a certain unthinking sharpness in every countenance. They look attentive, but their thoughts are engaged on mean purposes. To me it is apparent, when I see a citizen pass by, whether his head is upon woollens, silks, iron, sugar, indigo, or stocks. Now this trace of thought appears to lie hid in the race for two or three generations.'

In the daily walks to office much may be seen of the petty trades of London—the under-current of its commercial activity. Things are turned to account here. In front of patten and clog makers' shops, stand small baskets filled with the little lumps of beech sawn off the ends of the sole pieces—'only a penny.' A little farther on, at a place half shop, half shed, a man and two or three boys are busy sawing and splitting firewood. One saws the blocks to the required length, a second splits them, and a third, with the aid of a small lever and a strong loop, ties them up into bundles with marvellous accuracy and celerity. This, though classed among petty trades, requires the employment of large capital. We have seen a wood yard, half an acre in extent, by the side of the Surrey Canal, completely filled, and piled to the height of thirty or forty feet with the 'chunks' of pine brought from Canada, to be split up and sold four bundles a penny, to kindle fires in London. A few of the old cobblers' stalls, little dens, half in the cellar, and half in the street, are still to be seen. Pass when you will, their occupants are always busy; it does not appear, however, that any of them ever remove into a shop or more roomy premises. A parallel class of out-of-door workers, are the men who go from one butcher's shop to another to sharpen and set the saws. Half-a-dozen files, a hammer, and 'saw-set,' a wooden stand with screw-clamps, constitute their stock in trade. The stand is generally painted the professional blue; and the fliers appear to be merry fellows, for they whistle blithely while at their work, generally performed at the edge of the pavement. Another form of petty trade is presented by butchers' and provision shops: the latter with pennyworths of bacon and scraps of cheese; and the former with fragments—cuttings and trimmings of mutton and beef—of most repulsive appearance. Yet nothing is lost: however indifferent the article offered for sale, there is always a purchaser for it. The New Cut, in Lambeth, the upper extremity of White Cross Street, and Clare Market, offer a spectacle fraught with profound instruction about the animal food supplied to the humbler classes of London.

'Garret masters,' as they are called, represent a considerable amount of petty trade. They are turners, carvers, cabinet and chair makers, and almost every

other business that can be mentioned. How often, on a Monday or Tuesday morning, you meet the wife or boys of one of these small traders, with a plank and cane for chairs, or veneer for workboxes—material for another week's struggle! On Saturdays you will see the man with tea-caddies, a table, or half-a-dozen chairs upon his shoulder, panting along with hungry and anxious look to find a purchaser. Poor creatures! many of them are to be pitied; for very often the price they obtain does not exceed the cost of the materials on which they have expended six days' labour. Several of the large advertising houses derive their supplies of goods from these sources. Boys, looking keen and experienced as grown-up men, are seen both morning and evening delivering and vending newspapers—how they collect round the doors of newspaper offices on the announcement of a 'second edition,' waiting for news as jackals for carrion! A singular fact connected with these boys is, that they go 'on 'Change.' Turn up Catherine Street any afternoon about four, and there, within hearing of the Strand, you will find them congregated, and with a perfect Babel of cries exchanging papers. 'Times' for 'Herald'—'Standard' for 'Chronicle'—who wants 'Globe?'—who wants 'Daily News?' are calls kept up for the better part of an hour with vociferous iteration. Watch the group for a few minutes, and you will see that the newsboy is as great an adept in turning a penny as the stockbroker farther east. Our present purpose is to describe only the more obvious of what presents itself to the eye in a walk to or from office; much more might be written, were we inquiring into the multiplied resources for gaining a livelihood to be found only in great cities. One more instance, and we must leave this part of our subject. Every day, 'except Sundays and holidays,' two rather grim-faced, weather-beaten men may be seen walking up and down under the portico of Somerset House. For years have they taken up their position in this place, from ten to four, and will probably continue to do so until incapacitated by age or infirmities. They look like man-of-war's men 'in shore-going toggery'; and their business is to stop the sailors, great numbers of whom are continually calling at the Admiralty Office, within the quadrangle of the building, and advise them how to proceed in making their inquiries. With the proverbial generosity of seamen, the applicants, on leaving the office, hand over a fee to their two informants, or invite them to drink at a neighbouring tavern. It is only in such a place as London that it would be worth any one's while to come out in all weathers, with clean polished shoes, and well-brushed though threadbare coat, to watch for the chances of a living from such an apparently uncertain source.

It sometimes happens that the routine of official duty is disturbed by some unexpected stroke of business; on such occasions, a brief interval is allowed for refreshment at a coffee-house—a half hour, in which some of the peculiarities of London life may be studied. How the disposition to avoid all unnecessary expenditure of words appears in the short, technical orders issued to the attendants! With some customers it borders on slang: 'Coffee and a thin un!' or, 'Dab o' grease and ball o' pipeclay!' may be heard from some remote corner; the speakers' requirements being a cup of coffee and a thin slice of bread and butter, or a pat of butter with an egg. You may observe, too, how the demand for bread serves as an index to the season. In cold weather, brown and cottage loaves are most in request; but in warm weather, nothing will go down but light French rolls and tea-cakes. London coffee-houses would be nearly all that could be wished, if their arrangements included ventilation, and real coffee for the fluid supplied to customers.

Should it happen to be a Saturday on which the unexpected detention occurs, the walk home late in the evening reveals many new features of life in the great city. The people who now crowd the streets are quite of a different class to those seen during the day: la-

bourers, operatives, and artisans with their wives and children, are making their purchases for the week or the next day. This is the time to see the infinitesimal system of dealing carried out at butchers 'and grocers,' or any place where food is sold. Petty dealers, never seen at any other time, now station themselves at the entrances of alleys and corners of streets, offering skewers, meat-hooks, penny roasting-jacks, cabbage-nets; in short, a complete *batterie de cuisine*. They invite purchasers in most vociferous tones, and it is hard to say whether they or the beggars are the more importunate; the latter have to provide for a blank day on the morrow, and make most moving appeals to the charity of bystanders. Presently you come to a ready-made clothes warehouse, flaring and flashy, in front of which half-a-dozen musicians, engaged by the proprietor, have been blowing away most lustily ever since noon, and will keep on till midnight. This is a frequent mode of advertising in the transpontine regions, and is often adopted by enterprising bakers, when the usual 'glass of gin,' or 'penny returned with every loaf purchased,' fail to attract. So bewildering are the noise and confusion, that you feel a sensible relief as the walk homewards carries you into a quieter neighbourhood.

It is pleasant to note the succession of flowers, from the crocuses and violets of early spring to the roses and carnations of summer, offered for sale in the streets. The taste for flowers has increased of late years; some persons you will see never walk to town without a flower in their button-hole during the fine season. From the markets, as centres, they are carried in hand-carts, barrows, or baskets, into every quarter of the town: even back streets and dismal alleys are visited by hawkers of flowers; and is it too much to expect that the sweet-scented things may have a humanising influence? Another pleasure of the summer season, is the opportunity for varying the daily walk by a trip in one of the cheap steamboats. You make for the nearest bridge, walk on board, and for a halfpenny, are set down close to your place of business. These river omnibuses are admirable places for observation; here you may detect many peculiar characteristics of the Londoner. Rather than wait two minutes and a half for the next boat, they overcrowd the deck until the little vessel is top heavy, and stand wedged together, half suffocated, without the possibility of changing their position. They will land at all sorts of inconvenient wharfs, with imminent risk of life and limb, week after week, and month after month, or until it may please the proprietors to provide better accommodation. Extremes meet: and London is at once the fastest and slowest of cities. The man who cannot stay to answer your salute in the street, will live with exemplary patience close to some horrid nuisance for ten or twenty years. He wonders what people can possibly find to do with themselves in the country, and goes night after night to the same parlour, in the same tavern, to hear the same rapid talk that he already knows by heart.

You walk home leisurely on summer afternoons, resting a while to contemplate the animated view from the bridge you may choose to cross, or halting at some of the frequent book-stalls. All the world is thirsty: the benches in front of public-houses are crowded with porter drinkers, who imbibe the contents of pewter pots with infinite relish; and venders of ginger beer offer their cooling draught at every hundred yards. Frequent parties of strangers are now met on the shady side of the street, gazing with wondering delight on all they see. Among these some have evidently come to settle in London: you may see them cheapening furniture at the brokers' shops; perhaps a widow with two or three children, eking out a scanty income to the utmost. According to Johnson, whom we have before quoted, 'there is no place where economy can be so well practised as in London: more can be had here for the money, even by ladies, than everywhere else. You cannot play tricks with your fortune in a small place: you must make a uniform appearance. Here a lady

may have well-furnished apartments, and elegant dress, without any meat in her kitchen.'

If the weather be at all rainy, the approaches to the bridges are beset by retailers of second-hand umbrellas: 'Only one shilling each!'—'Save a shower for a shilling!' It is a better business than would at first sight appear; for, apart from those who can afford only a shilling for an umbrella, there is many a well-to-do citizen who would rather lay out that sum than get wet to the skin. Day after day, as your eye glances along the line of clerks and men in office walking homewards, you are sure to see one carrying a blue bag. A blue bag is considered respectable; it has an official look about it; it suggests ideas of papers and parchments tied up with red tape. But appearances are often deceptive: if that young clerk there, who has not yet reached his first promotion, would show you the contents of his bag, you would see a leg of mutton, a bargain from Leaden-hall or Newgate market. We have known oysters, ox-tails for soup, onions, crockery, to be carried home in a blue bag. The bag enables many to economise, who otherwise would be ashamed to do so.

But the days begin to draw in: by and by both sides of the street are shady; and those who look for sunshine as they walk home, see it only on the gilded weathercocks of church steeples, or slanting through the opening of some side street in long sickly-looking rays. And then, before you are aware of it, the return walk is all by lamplight; and the long suburban roads, with their lines of flame on either side, remind you, as you look down them, of the avenues described in the 'Arabian Nights,' brilliant with lights, but ending at last in a gloomy void. Butchers and grocers are decorating their shops again with holly, which reminds us that our Walks to Office have made the round of the seasons.

A SECOND WORD ON THE ROADS.

NEARLY three years ago, we took occasion to notice a plan for reforming the public road managements throughout the United Kingdom, projected by Mr W. Pagan, a Scottish country solicitor. Since that period, the subject has attracted the attention of divers road-trusts, town-councils, and other public bodies, and been received in a generally favourable manner, without, however, any practical result being attained.

The present method of maintaining the principal roads by means of exactions at toll-bars is universally agreed to be most objectionable. It is interruptive of intercourse, annoying to travellers, distracts traffic into wrong channels, is a severe and clumsily-levied tax, and, worst of all, not more than from 50 to 60 per cent., on an average, of the money so levied, goes to the support of the roads—the remainder being swallowed up in the erection and maintenance of toll-bars, the paying of turnpike-men, legislation, and jobbery. To keep the principal roads of England in repair, nearly five thousand toll-bars are put in operation, and the expense of the acts of parliament to sustain the system in vigour, has been stated to be £100 per mile. The cost of collection alone is said to amount to £800,000 per annum. Besides the charge for maintaining the principal roads, large expenses are incurred for cross or parish roads, which are usually supported by rates. Mr Pagan's plan points to the entire abolition of toll-bars, the consolidation of trusts, and the levying of an annual rate on horses, as the sole means of supporting the roads and liquidating the debts which the trusts have generally incurred. In the first edition of the work in which this projected reform is explained, the writer presents tabular statements showing the extent of saving that might thus be effected within two counties—Fife and Kinross. Rating all the horses in the district at 30s. each per annum, £18,000 would be raised—a sum which, compared with that levied by the existing methods of exaction by toll-bars and otherwise, would effect a

saving of £15,000. The second edition of Mr Pagan's work,* and some other tracts he has issued on the same subject, make several revelations equally worthy of remark. It appears from a statement respecting the above district, that an annual rate of 27s. 6d. per horse would be sufficient. Of this rate 19s. 6d. per horse would maintain the roads, 5s. 6d. would go to the payment of interest and redemption of the debt, and 2s. 6d. be taken for management. In this way the management would cost only a twelfth part, or $\frac{1}{12}$ per cent., instead of 44 per cent., as at present! The debt, he calculates, would be paid off in thirty years; and accordingly, the rate per horse would ultimately sink to 22s. From some investigations that have been made, it appears that farmers, the class most opposed to the change, would generally save by the adoption of this plan. Among twenty-nine of the leading agriculturists in Fife, there would be a gross saving of £186, 4s., or about 27 per cent. per annum. A farmer in one of the southern counties of Scotland lately mentioned to us that the lime he laid upon his land cost him at the rate of sixteen shillings per acre for toll-bars!

Having been invited to state his plans at a meeting of the county of Forfar, Mr Pagan showed, by a statement before us, that he could effect an annual saving of nearly £4000 on the road system of the county. The aggregate sums levied from the public annually by toll-bars, and statute-labour, and bridge-rates, amounted to £18,332. This he proposed to reduce to £14,500, raised by a rate of 29s. per horse—of which there would be applicable to road repair, 18s. 6d.; to expense of management, 2s. 6d.; and to payment of interest and redemption of debt, 8s. By the extinction of the debt in thirty-one years, the rate would ultimately fall to 22s. But there was a likelihood that, by the diminished wear and tear of roads, arising from absorption of traffic by railways, as well as from an increase in the number of horses, the rate might be lowered much sooner. In all probability, the rate would ultimately be only 14s. 6d. per horse!

From statements brought forward at meetings in Haddingtonshire and other places, similar inferences are drawn. Scarcely a voice is lifted in defence of what is now admitted to be a great abuse. The only parties who attempt a vindication of the toll-bar and statute-labour exactions, are the functionaries whom a change would dispossess—lessees of bars, turnpike-men, and a host of clerks and collectors. Nevertheless, it cannot be said that there is as yet any overt attempt at reform. The trusts, composed exclusively of the landed gentry, who are unfortunately not men of business, seem to be in a sense paralysed. They almost everywhere acknowledge their existing condition to be bad, but they hesitate as to the means of improvement. It would be well that they proceeded to fix on some determinate policy. In all the central and populous districts of the kingdom, the roads are already deprived of their thorough traffic by railways, and nothing is left them but local intercourse; in other words, the roads now depend for support chiefly on the rural population, the tolls upon many of them are scarcely worth collecting, and the trusts, burdened with heavy debts, cannot meet their obligations. In this state of things, toll-bars are increased in number, to the grievance of rural tenants and villagers; but all will not do; and from forty-four per cent. for collection, the ratio of expenditure rises to sixty, eighty, and even a hundred per cent. We happen to know the case of a toll-bar in a rural district which yields only £4 annually. To gather this sum, £2 and a free house are given to a female keeper. As the house and bar undoubtedly cost £120, the annual interest of which sum is £6, it is evident that the road-trust loses £4 by the transaction. This deficiency, however, really falls on the public, which incurs an expenditure altogether of £10, no more than £2 of which actually goes

* A pamphlet of 120 pages. Blackwood, London and Edinburgh.

to the maintenance of the road. The cost of collection in this instance is five hundred per cent. ! Ere long, in many quarters, turnpikes will not draw sufficient to pay their keepers. Then will begin the end of toll-bar exaction. Except in remote localities, and in the close vicinity of towns, it will perish from mere natural decay, and no one will pity its fall !

Foreseeing these consequences, the apathy of turnpike trusts seems like an infatuation. It surely cannot escape their notice that the loss, falling first on the rural population, will come ultimately on land. The question, therefore, as to toll-bars and no toll-bars, is one which greatly more concerns landlords and their tenants than the people of towns ; and on this account, except from a wish to see an end put to a social barbarism, the subject is not likely to excite much popular commotion. We are sorry to observe that, in some districts where the question has been agitated, the tenant farmers, while not objecting to the removal of toll-bars, have opposed Mr Pagan's plan of reform, on the score that the proposed rate levied on horses would bear unduly on them, in relation to others who make use of the roads. Although it is our belief that farmers generally would be relieved by the principle of a uniform rating of horses, as compared with their present condition, it may be admitted that the reverse would possibly be the case in a number of instances. The degree of rating, however, is a matter of detail ; and Mr Pagan does not press for an exact uniformity in all circumstances. The horses, for example, which are employed pretty continuously in stage-coaches, and omnibuses, and in carriers' wagons, might properly enough be subject to a higher rate than horses engaged almost exclusively in agricultural operations, or in carting rural produce. Some parties, we know, incline to government management and taxation for the roads ; but this we hope never to see. Local managements, though sometimes defective in their operation, are of the highest value in cultivating a practical knowledge of affairs, and preserving constitutional freedom. Let local trusts and taxations, therefore, continue, but organised on better models, and in most instances consolidated over districts irrespective of county divisions.

We are not without a hope that some individual will step out of the ranks to master this important subject, and distinguish himself as a leader in road reform. Thanks to Mr Pagan, the way is open before him.

VINTAGE AT BORDEAUX.

We had spent the greater part of the summer of 18— in wandering among the Pyrenees, whose then unsophisticated small watering-places had greatly delighted us ; their simple, and in some cases rather rough accommodations, and the absence of all the ordinary idle appliances for killing time, being amply compensated by the society of a relation long settled in that region, whose sporting propensities, as well as his taste for the natural beauties of this magnificent region, had made him thoroughly acquainted with every nook and corner which a hunter after a bear, ibard, or the picturesque, could desire to reach. Many a delightful expedition to the higher parts of the mountains, or to some spot out of the beaten regular 'guide' track, did we accomplish under his experienced direction ; always rendered more interesting, from his knowledge of the Bearnais dialect enabling him to give us information on the peculiar habits of this people, which we could not have obtained under ordinary circumstances. There was a cheerfulness also given to these mountain rambles, from his being able to converse with any of the country folks overtaken on the road, or who were busy about the cabins we chanced to pass, and many local tales and traditions of that district became ours through his means. In some of our shorter evening strolls, husbandry, cultivation of land in general, wine-making, &c. used occasionally to be discussed by the gentlemen of our party ; and as the summer closed in, and the season of the 'vendange' approached,

we all wished it were possible to witness that busy scene. Our longings were destined to be gratified, for a kind invitation from the Comte de — to one of our party opened the way for the whole inundation of us ; and we set forth not only to view the vintage, but with the prospect of a residence, at that interesting period, in a veritable French château. We reached Bordeaux in the evening, where a letter awaited us from the Comte de —, full of friendly welcome, and pointing out all the necessary steps for our safely and expeditiously reaching his place on the following day.

At eight o'clock the next morning, we were accordingly on board the steam-vessel which was to carry us down the Garonne. Its banks in this direction do not long continue to bear the beautiful *riant* character which so delighted us in the upper part of this noble river ; and I could not help reverting to the change since I had sat on its banks in Spain, enjoying a rural luncheon, carried with us to the edge of the narrow, gently-flowing stream, in which the olive-complexioned women of the village were washing their linen, and the children, half-clothed, picturesque little objects, were dabbling and crossing over it partly on stepping-stones !

The weather was not bright ; but there was a large, cheerful, and amusingly mixed company on the deck ; and a most excellent breakfast was soon served, which drew us all much nearer to our associates, among whom were families going to their country-seats, whose names, connected with mercantile affairs, I had heard, when a girl, mentioned in England. The time was agreeably spent in hearing their accounts of the many villages we passed, and in watching for the meeting of the rushing Dordogne, which comes very boisterously down upon its more dignified brother the Garonne ; occasioning the same sort of contest which occurs in the Shannon, and which is called in England a 'bore.' About two o'clock we reached the landing-place, and found the carriage of Monsieur le Comte, driven by a cocked-hatted coachman in full livery, in waiting to convey us to the château, distant about three miles. The roomy old coach soon carried us to the mansion ; and before we could alight, our host was on the flight of steps, which he descended to meet me, who had the good fortune to be on that side of the carriage. I was immediately taken by the hand in the most courtier-like manner, handed through the ante-rooms, &c. and finally seated in one of the fauteuils, at the side of a large old-fashioned chimney corner ; my young companion, with equal deference, being similarly escorted by the eldest son to the corresponding seat of honour. There we sat for a while, like the two supporters of a heraldic shield !

The two elder daughters of our host, unluckily, were absent, but the honours of the house were kindly and gracefully performed by his son's wife ; and there were also many agreeable intelligent men staying in the château, a very curious rambling old concern, full of faded grandeur. The 'salon,' into which we were first ushered, had that formal bare appearance which was usual in the days of our grandmothers, when no one thought of moving, or perhaps had the strength to move, the massive seats from their allotted places, or of deranging the order in which two rows of yellow damask gilt chairs were placed against the wainscot, round the room, as in the present case. The apartment was lighted by many very lofty windows, composed of small panes of glass ; and the large old trees immediately overhanging them, gave the room, with its uncarpeted polished oak floor, a very sombre air, quite in keeping, however, with the appearance of the old comte and the 'ancien régime' tone of things in general ; and we soon discovered that we were in one of the strongholds of 'conservatism' and 'legitimacy'—Don Carlos and Henry V. being there objects of profound and respectful interest. The former had been actively seconded by one of the family in his secret journey to Spain ; and the mother of the young prince, not having at that time played all her 'fantastic tricks before high Heaven,' was the heroine of their romantic loyalty. A pair of superb Sèvres jars, many feet high, standing in corners of the salon, gifts from her, were pointed out to us with a proud pleasure

by these devoted adherents to her son's cause. I could not but think of one of Sir Walter Scott's old cavaliers when listening to the fearless remarks of our venerable host on present times. His details of bygone days were likewise curious, when one of his ancestors, whose portrait hung over the drawing-room mantelpiece, formed part of the cortège that accompanied the infants from Spain to France, and whose château was one of the resting-places for the betrothed princess before proceeding to meet her future husband Louis XIV.

The first difficulties of introduction among persons with whom we had no common tie or subject of interest, were soon got over by this truly well-bred family; still we were glad when there was a move to prepare for dinner. This repast was most elegant as to the cuisine, though in some of the appointments the table might, in these luxurious modern days, be considered slightly deficient; but then it was in matters that made the whole affair less commonplace; and the attentions of our high-bred, kind-hearted host made us all forget, long before we rose from table, that our acquaintance was of only a few hours' standing. We all quitted the dining-room at the same time, as is usual abroad, the two lady-visitors being led by the hand to the drawing-room, as on their first arrival. Some strolled into the gardens, others to the billiard-table; and on my return from my room, after the lights were brought, I was amused to find my young companion engaged at piquet with one of the gentlemen, quite fearless of the difficulties of new terms, &c. in this her debut at card-playing in France, and in full flow of French conversation with her agreeable adversary. He had been many years a prisoner in England, and having lived in very good society (on his parole, I suppose), was full of inquiry concerning many persons, mutual acquaintances, as well as about customs, places, and things which had changed in various ways since his liberation. He understood and wrote English extremely well, and gave her even some very pretty poetry written in our language, making the most polite efforts at speaking it likewise, though he had lost his fluency. A small round waiter was brought in, and placed on a little table at the end of the room; and there tea was poured out of a small china teapot into diminutive but beautiful cups, such as would have excited greedy longings in a china-fancier. This beverage was evidently served in compliment to 'les dames Anglaises,' so my young companion and I partook of it; the rest of the family helped themselves at their pleasure from the 'carafe' of cold water, to which they added sugar and 'fleur d'orange,' a bottle of which favourite preparation stood beside the tea equiptage.

The bedchamber was as singular-looking as our love of novelty could desire—lofty, with many large windows and several doors. None of these fitted very closely, and we were on the ground-floor; so that, with the occasional startling from their noise, the sighing of the wind through the overhanging trees, and our own thoughts on the novelty of our position, it was some time before we sunk to rest. There were no blinds to keep the sun from shining through the boughs into our room, gladdening us with the assurance of a brilliant morning having succeeded the dull unpromising evening; and while considering whether, by stirring at this early hour, I might cause some commotion among the household, one of the doors was gently opened, and Mademoiselle Julie, the pretty *femme-de-chambre* to Madame de —, glided softly up to the bedside, having a small tray in her hand, on which were two delicate little cups of green tea, with the necessary accompaniments, and a plate of biscuit. While presenting these to each of us, her graceful manner, her costume, and the singularity of being thus awakened, made my young companion fancy she had opened her eyes on a scene at the 'Gaieté' or 'Vaudeville.' This refreshment was considerably provided before making our toilettes, lest we should be exhausted by waiting for the regular *déjeuner*, which would not take place for some time. We found that most of the family had gone to mass, *early*, at the neighbouring village, in order to be free to give us their company during the remainder of the day; but we assembled between ten and eleven at

a most *recherché* meal, served *sans* tablecloth, which omission deprived it in our eyes of all the elegance belonging to choice fruit, fine fish, game, and every article that could form a tempting repast. The conversation was lively and agreeable, ending by a proposal to walk through all the vineyards of our host, who accompanied us. He was full of information concerning the different growths of the surrounding lands; for the varieties in the size and appearance of the grape, and consequently in the quality of the wine produced, are in many instances extraordinary—a narrow lane only sometimes intervening, on one side of which there will be a first-class production, while its opposite neighbour has hardly a *name* with the wine-buyers. The same mode of cultivation will not remedy this caprice of nature; and even in one instance, where a trifling slope of the ground a little varied the exposure of a plant, there was a perceptible difference in the flavour of the fruit. In the afternoon, we completed our course of examination by a visit to the Lafitte and Monton vineyards, and to the village of Cost, famous for the St Esteppe wine. Our delightful old comte accompanied us, and enlivened by his agreeable intelligent conversation this classic drive through a pretty though somewhat flat country; most interesting, however, when one considers what is the produce of so vast an extent of plants, more insignificant in appearance than our currant bushes, for none are suffered to grow to more than three feet in height. On our way home, we stopped at the church where the family had gone in the morning to mass, that we might see a picture of the 'Crucifixion' by Mademoiselle —; and though this specimen of amateur art was far above mediocrity, it was less interesting to us to behold than the good old man's delight in showing us this sample of his daughter's talent and piety. The evening was delightful; and after dinner, I had a long and charming walk with the comte, who greatly interested me with the particulars he gave concerning the mode of managing the vines, &c. They furnish constant occupation all the year round to families who live close by, and who have each certain portions intrusted to their superintendence, which is required *day and night* at particular seasons. These crops were all of the black grape; but the colour of the fruit does not affect that of the wine. At a certain stage, there are assistants also required to give additional turning to the ground about the roots of the plants, or to thin the leaves; and this last is a most delicate operation, as a little too much of exposure, or exposure not timed to the moment when the grape requires it, may be its ruin! When I add, that the vines are subject to a plague, in the shape of a *fly*, and another in the shape of a snail, to a terrible extent, it will appear that these precious productions cause as much anxiety as our own useful and far more beautiful hop, before they attain to full and perfect maturity. There was a small tower-looking building raised very high in the midst of the crops, where at this time I was amused to see a man *watching* from a little wooden balcony, recalling to my mind allusions to such things in the Scriptures. Busy preparations had been going on all this day, by men bringing out casks, which had been stored away somewhere in the château, not far from our room on the ground-floor; for we had been awakened by the unusual rumbling noise made by rolling them close by our windows. People were busy likewise in putting in order the yard and 'ouvrier,' or great wine-house; and thus everything we saw and heard increased the interest with which we anticipated the 'gathering,' which was to begin on the following morning.

The sun shone out gloriously; and long before we were dressed, the merry voices of women and children were heard, who are principally the 'cutters.' One hundred of these are employed, besides the numbers of men required for the more heavy work of lifting the wooden sort of basket, two of which, when filled with grapes, are put on a low sort of cart, to be driven away to the crier. In this merciless toiling to and fro, all bloom and beauty of the fruit, alas! soon disappears. The whole band of labourers assemble at sunrise, when breakfast, consisting of bread, onions, and grapes, is served out in the great

yard. We were not, however, up early enough to witness this performance; but when our own more delicate meal was finished, we accompanied our venerable host to the scene, and on his appearance, there was such a lighting up of the rough countenances around us, and so pleasing a buzz among the workmen, as showed their delight at the kindly general sort of greeting given by their old master, whose arrival at the cuvier is considered to begin the 'vintage.' The cuvier is much like a very capacious barn; and the good old comte pointed out to us a large, simple wicker-chair, in which, for sixty years, his mother regularly took her seat on the first day, and which had never been moved since her death. An equally precious relic was the old fiddler, who for above fifty years had, on these occasions, stood on the same precise spot where he now received his beloved patron's special notice with a sort of proud gratitude. The comte gives the signal, and now the music strikes up, and the first cart tumbles its precious load, through a wide sort of arched window, into the great cistern, which stretches along just below the level of its sill. There were three of these openings in the length of the building; and each cistern was manned by sixteen men in merely their white shirts and short breeches tucked up above the knee, showing the brawny legs and bare feet which were soon to 'tread a measure' to the old fiddler's lively melodies. A strange effect it had to our English eyes when these rough-looking beings, taking their places opposite to each other, began a set of quadrilles in a most decorous manner, at every step crushing down the once beautiful fruit, whose juice runs out at an aperture in one corner into tubs, beside which a man watches lest they should overflow. I ought to have mentioned, that before the ball commences, there is a very large wire-frame or cullender placed over the shallow cisterns, in which the men rapidly separate the stalks from the fruit; the latter falling through, and the stalks being carried to another cistern, where a man with a small kind of rake picks off any grapes remaining on them. These stalks are then piled up in a press, and the liquor they yield makes an inferior drink for the lower classes. As the juice streaming from the pressers' cisterns filled the tubs, they were borne away on poles between two men staggering under their loads, like Caleb and his companions bearing away their bunch of grapes from Eshcol. I was surprised to hear that the *skins* of the grape are thrown with the juice into the great vats, where all is left to ferment, during which process they rise to the top of the 'must' (as the liquor is then called), and are easily skimmed off afterwards. At twelve o'clock symptoms reached our ears of fresh bustle, and we were soon summoned out to the great yard, where a temporary wooden kitchen had been erected, and where the large, cheerful body of labourers—men, women, and children—were assembled, divided into moderate-sized groups, engaged in merry chat, till it came to their turn to be served with dinner. This consisted of *bouillon*, with plenty of good bread in it, followed by an excellent dish of meat and potatoes, much like our unmentionable Irish stew. We were much interested in watching them, all polite to each other, and in full enjoyment of their rest and this excellent fare. A supper of bread and grapes finishes the day, throughout which there are casks of small wine near at hand for general refreshment; and assuredly, most necessary was some such beverage, for the heat was so intense, that, towards the latter part of the afternoon, the *dancers* had much slackened their movements; and many told us that, but for the inspiring tones of the violin, they should not be able to get through their labour. I was amused to see the old *Orpheus*, too, nodding most vehemently now and then—and not surprised, for besides his indefatigable exertions, something might be ascribed to the fumes arising from this quantity of grape juice (beginning soon to ferment), which had a perceptible effect upon my own head during the comparatively short time I was exposed to their influence. Besides this liberal board, the men were all to have a franc a day; but the money wages vary with the season.

The concluding day of the vintage is distinguished like

our own harvest-home, and is quite a festival, dancing and a supper winding up the whole; but unluckily our plans did not allow of our remaining to witness the gay scene. Most sorrowfully did we ladies especially see the carriage drawn up soon after our last breakfast with these kind people, who neglected nothing that could make our stay or our going away agreeable. They did 'welcome the coming and speed the parting guest' in the truest spirit of kindness; and we took our leave as if they had been the friends of many years, instead of recently-made acquaintances, with real regret that the distance between us, and the great age of our venerable host, made it so little probable that we should ever meet again. There was another painful feeling accompanying our departure from this hospitable mansion—we were now to consider our holiday as drawing to a close, and on reaching Bordeaux, were to commence our long journey to England. In those days there were no railways on the continent; and when we reached the Dordogne, which could be crossed only by an immense *ferry boat*, we were told, to our great astonishment, that the current was running too strongly for it to cross. For above an hour, on a miserably rainy morning, did we sit in our carriage till the turbulent waves subsided, when our vehicle, and the *malle poste*, whose patience had been put to the same test, were shipped on board of an enormous barge, moved by a horse in a mill; and this primitive, uncouth-looking vehicle was the medium of communication between the two greatest cities of France! A suspension-bridge was about to be constructed; and when the projected railway, too, is finished, travellers of the present day, who skim rapidly in all directions without hindrance or adventure, will view as 'old women's tales' the singular shifts, diverting *contre-temps*, and entertaining incidents which were to be enjoyed by those who could keep their tempers, and open their eyes and ears wide enough, in a journey performed at the rate of five miles an hour, and in a quarter where the English were still stared at. We never met, however, with anything to annoy us seriously; and though no thoroughgoing conservative, I look back with thankfulness to my lot in having made this delightful journey as in the 'good old times,' with four stout steeds to our own luxurious travelling-carriage. But here we must part. Vines and grapes met our eyes for many days, but with them we had no friendly associations, and my little narrative is therefore at an end.

ANECDOTES OF DOGS.

The following are selected from a great variety of interesting anecdotes of dogs in Captain Brown's 'Popular Natural History,' just published:—

An English gentleman some time ago went to Vauxhall Gardens (France) with a large mastiff, which was refused admittance, and the gentleman left him in the care of the body-guards, who are placed there. The Englishman, some time after he had entered, returned to the gate and informed the guards that he had lost his watch, telling the sergeant, that if he would permit him to take in the dog, he would soon discover the thief. His request being granted, the gentleman made motions to the dog of what he had lost, which immediately ran about amongst the company, and traversed the gardens, till at last he laid hold of a man. The gentleman insisted that this person had got his watch; and on being searched, not only his watch, but six others were discovered in his pockets. What is more remarkable, the dog possessed such a perfection of instinct, as to take his master's watch from the other six, and carry it to him!

Of the alertness of the dog in recovering the lost property of its master, we shall give one other instance. M. Dumont, a tradesman of the Rue St Denis, Paris, offered to lay a wager with a friend, that if he were to hide a six-livre piece in the dust, his dog would discover and bring it to him. The wager was accepted, and the piece of money secreted, after being carefully marked. When they had proceeded some distance from the spot, M. Dumont called to his dog that he had lost something, and ordered him to seek it. Caniche immediately turned back, while his master and his companion pursued their walk to the Rue St Denis. Meanwhile a traveller, who happened to be just then returning in a small chaise from Vincennes, perceived the piece of money, which his horse had kicked from its hiding-

place; he alighted, took it up, and drove to his inn in Rue Pont-aux-Choux, and Caniche had just reached the spot in search of the lost piece when the stranger picked it up. He followed the chaise, went into the inn, and stuck close to the traveller. Having scented out the coin, which he had been ordered to bring back, in the pocket of the latter, he leaped up incessantly at and about him. The gentleman, supposing him to be some dog that had been lost or left behind by his master, regarded his different movements as marks of fondness; and as the animal was handsome, he determined to keep him. He gave him a good supper, and on retiring to bed, took him with him to his chamber. No sooner had he pulled off his clothes, than they were seized by the dog; the owner conceiving he wanted to play with them, took them away again. The animal began to bark at the door, which the traveller opened, under the idea that he wanted to go out. Caniche instantly snatched up an article of dress, and away he flew. The stranger posted after him with his nightcap on, and literally *sans-culottes*. Anxiety for the fate of a purse full of double Napoleons, of forty francs each, which was in one of the pockets, gave redoubled velocity to his steps. Caniche ran full speed to his master's house, where the stranger arrived in a moment afterwards, breathing and enraged. He accused the dog of robbing him. 'Sir,' said the master, 'my dog is a very faithful creature, and if he has run away with your clothes, it is because you have in them money which does not belong to you.' The traveller became still more exasperated. 'Compose yourself, sir,' rejoined the other smiling; 'without doubt there is in your purse a six-livre piece with such and such marks, which you picked up in the Boulevard St Antoine, and which I threw down there with a firm conviction that my dog would bring it back again. This is the cause of the robbery which he has committed upon you!' The stranger's rage now yielded to astonishment; he delivered the six-livre piece to the owner, and could not forbear caressing the dog which had given him so much uneasiness and such an unpleasant chase.

NATIONAL PREJUDICES.

From the moment in which the exercise of certain expressions of good-will is exclusively directed to the body, the class, or nation to which we belong, and is denied to others—from the moment in which they break out into words and deeds of antipathy—from the moment in which the fact that a fellow-man speaks a different language, or lives under a different government, constitutes him an object of contempt, abhorrence, or misdoings—from that moment it is maleficent. A toast, for example, in America has been given, 'Our country, right or wrong!' which is in itself a proclamation of maleficence; and if brought into operation, might lead to crimes and follies on the widest conceivable field—to plunder, murder, and all the consequences of unjust wars. Not less blameworthy was the declaration of a prime minister of this country, 'That England—nothing but England—formed any portion of his care or concern.' An enlarged philanthropy indeed might have given to both expressions a Deontological meaning, since the true interests of nations, as the true interests of individuals, are equally those of prudence and benevolence; but the phrases were employed solely to justify wrong, if that wrong were perpetrated by the land or government which we call our own. Suppose a man were to give as a toast, in serious earnest, 'Myself, right or wrong!' Yet the above assumptions of false patriotism, both in America and England, are founded on no better principle.—*Bentham*.

THE LAW OF KINDNESS.

In a quarter of the town of Hingham, known as Rockynook, there is a pond where a little girl, not six years old, who resides near the bank, has tamed the fishes to a remarkable degree. She began by throwing crumbs in the water. Gradually the fishes learned to distinguish her footsteps, and darted to the edge whenever she approached; and now they will actually feed out of her hand, and allow her to touch their scaly sides! A venerable turtle is among her regular pensioners. The control of Van Amburgh over his wild beasts is not more surprising than that which this little girl has attained over her finny playmates. The fishes will have nothing to do with any but their tried friend. They will trust no one else, let him come with provender ever so tempting. Even fishes are not so cold-blooded but they will recognise the law of kindness, and yield to its all-embracing power.—*Boston Transcript, United States*.

THE OLD AND NEW-YEAR.

Crossing last night a dreary moor,
Where deeply lay the snow,
I overtook at midnight hour
An old man creeping slow.
'Twas the Old-Year! with age subdued,
Tottering, and cold, and lean,
And seeking mid the solitude
Some place to die unseen.
He had brought me many happy days—
I would not on his ending gaze.

Scarce had I passed the touching sight,
When a deep stillness fell;
I heard an old voice say 'Good-night!'
And a young one chime 'All's well!'
I turned me: the Old-Year was gone!
And lo! a beautiful child
With silvery laugh came dancing on,
And ever sweetly smiled;
And prattled with such gulleless art—
I clasped the New-Year to my heart!

So 'tis with life! when midst the gloom
Of the soul's night, we see
A loved joy sink into the tomb,
Some young Hope comes with glee,
And sings so sweetly in our ear
Of gladness aye to last,
That mid our grief, we cease to hear
The music of the past—
And long as much for joys unknown,
As e'er we prized the blessing flown.

MAXIMS ON MONEY.

The art of living easily as to money, is to pitch your scale of living one degree below your means. Comfort and enjoyment are more dependent upon easiness in the detail of expenditure than upon one degree's difference in the scale. Guard against false associations of pleasure with expenditure—the notion that because pleasure can be purchased with money, therefore money cannot be spent without enjoyment. What a thing costs a man is no true measure of what it is worth to him; and yet how often is his appreciation governed by no other standard, as if there were a pleasure in expenditure *per se*. Let yourself feel a want before you provide against it. You are more assured that it is real want; and it is worth while to feel it a little, in order to feel the relief from it. When you are undecided as to which of two courses you would like best, choose the cheapest. This rule will not only save money, but save also a good deal of trifling indecision. Too much leisure leads to expense; because when a man is in want of objects, it occurs to him that they are to be had for money, and he invents expenditures in order to pass the time.—*Taylor's Notes from Life*.

CONSUMPTION.

Sir James Clark, physician to the Queen, enumerates, as the exciting causes of consumption, 'long confinement in close ill-ventilated rooms, whether nurseries, school-rooms, or manufactories;' he also says, 'if an infant, born in perfect health, and of the healthiest parents, be kept in close rooms, in which free ventilation and cleanliness are neglected, a few months will often suffice to induce tuberculous cachexia'—the beginning of consumption. Persons engaged in confined close rooms, or workshops, are the chief sufferers from consumption: thus, of the 233 tailors who died in one district in London, in 1839, 123 died of diseases of the lungs, of whom ninety-two died of consumption. Of fifty-two milliners, dying in the same year, thirty-three died from diseases of the lungs, of whom twenty-eight died from consumption. Dr Guy reports, that in a close printers' room, he found seventeen men at work, of whom three had spitting of blood, two had affections of the lungs, and five had constant and severe colds. After reading these sad facts, who can deny that the chief cause of consumption is the respiration of bad air?—*Ventilation Illustrated*.

SUMMER EXCURSION IN GERMANY.

STUTTGARD, AUGSBURG, MUNICH.

ONE may now very nearly make the tour of Europe by steam—steamboats by sea and river, and steam-impelled locomotives by land! A man may go from Edinburgh to Vienna, and not have more than a few hours of ordinary vehicular travel. Last summer I had a run of this kind through Germany, and the pleasantest thing about it was, that almost the whole time was spent in viewing interesting towns; the transit from place to place occupying a very brief, and, for its briefness, a very agreeable space. Having probably tired the reader with detailed accounts of former continental tours, I propose to devote but a very few papers to this excursion. The truth is, one loses the relish for novelty after seeing the continent several times, and leaves himself but little to glean. After the first sight of Calais, says a traveller, nothing surprises.

My route on this occasion was across Belgium to Cologne by railway, and thence up the Rhine by steamer to a point near Frankfort, whence I had the railway to Karlsruhe. Here, in crossing a hilly tract to Stuttgart, I entered on new ground: it was the first time I had gone any distance eastwards from the valley of the Rhine. Stuttgart, the capital of Wurtemberg, lying embosomed in a fertile valley, and built of stone, in a regular and tasteful manner, formed a point of interest for a day's leisurely observation. After seeing a good deal of Germany, I think it is one of the handsomest of its towns—the long rows of white and tall houses having a cleanly and pleasing effect. The town is evidently literary—a centre for printing and bookselling. I had the fortune to light upon a young and enterprising publisher, who, strangely enough, has entered on plans of publication similar to our own, and with the present Journal, as he acknowledged, as his model. I saw some of my own articles in German in his paper—one of them, 'A Day in Manchester,' which had conveyed an account of the Manchester Athenæum and soirée of 1846 to his readers. Nothing could exceed the attention of this ingenious publisher, on learning who it was that had dropped in upon him. A round of visits to remarkable lions was at once proposed and agreed to. The place most interesting to which we were conducted was a large edifice employed as a Public Museum and Library. The museum, containing the usual variety of stuffed beasts, birds, and fishes, reptiles in bottles, insects stuck on pins, and fossils, I pass over. I daresay it was a very good collection; but my feelings led me to take more interest in the library, which abounded in bibliographical curiosities. The greatest curiosity of all is a large room containing nothing but bibles. It seems that a late professor of the university of Tubingen had an extra-

ordinary fancy for collecting bibles. It was a mania. He devoted his means and his life to the pursuit. His object was to have a bible in every language in which the Scriptures had been written or printed, from the most remote times till the present. Accordingly, he accumulated bibles to the number of eight thousand five hundred, and at his death, bequeathed them to this institution in Stuttgart. The bibles are of all sizes. A large number are in folio and quarto, many in octavo and duodecimo. Going from shelf to shelf, our attention is drawn to ancient tomes, in dingy vellum, or faded leather and gold—bibles in Hebrew, Greek, Arabic, Sanscrit, Latin, all the modern tongues of Europe, Indian, African, Celtic—in all, I believe, sixty languages. Some were written with a pen on vellum, others were rare copies of printed editions. One was written with great elegance by a nun; and a curiosity equally valuable was a copy of the first printed bible of the illustrious Guttenberg.

Another room in the museum was devoted to missals and psalters, most of them beautifully illuminated; and here we saw a greater curiosity still. This consisted of several large volumes of costumes, the execution of a nun, and about three hundred years old. On each page was a figure, whose face and hands were painted in water colours; but the whole of the dress was in the actual materials employed in the garments of the original, every part being stuck on with the most surprising neatness. The labour must have been immense; most probably the work of a lifetime, and undertaken to lighten the solitude of a cell. We were informed that the volumes embraced the costume of every religious order, male and female; also of most of the kings of Europe, soldiers, and civil functionaries of distinction at the time. Adjoining this apartment was shown a room devoted entirely to manuscripts, some of them said to be valuable. I need hardly explain that the museum owes many of these acquisitions to the dissolution of monastic establishments, and their careful sequestration by the state.

From Stuttgart, the ride up the valley of the Neckar was charming. It was the 21st of May, and the whole country was white with the blossom of fruit-trees. Some of the hill-sides appeared at a distance as if covered with snow, such was the density and brilliance of the blossoms. The country was fertile and beautiful; but it betrayed all the evidences of poverty. The land in Wurtemberg is alleged to be too much subdivided, and there are swarms of people with the scantiest means of subsistence. On the roads, and in the fields, women wrought along with men, and, what was more new to us, they were labouring in gangs on a railway which is designed to connect the valley of the Rhine with that of the Danube. This railway pursues the valley of the Neckar to its summit, and there ascends

and crosses the mountains to Ulm. It seems to be cut without tunnels, and effects a most daring ascent by long winding gradients, which occasionally approach the brink of the precipitous banks. All the way to the top, the female labourers clustered like bees, their severe bodily toil, and skinny brown faces, imparting an unpleasant effect to what would have been otherwise an agreeable scene.

After crossing the bleak mountain tops, we found ourselves descending into the great broad valley of the Danube, and passing some fortifications in the course of construction, we entered Ulm. Hemmed within walls, badly paved, and with crooked narrow streets, Ulm has nothing to interest strangers but its ancient cathedral. It was a great relief, in a desperately hot afternoon, to take refuge in this grand old edifice, which, besides being as cool as a cellar, is attractive for some fine sculptures in wood and stone, and several painted windows of ancient date. The town being Protestant, we found a portion of the building fitted up with pews. The view from the summit of the lofty tower rewards the fatigue of climbing, by at once bringing under our eye the scene of several important battles, including that of Blenheim, which lies within the verge of horizon on the east. In the foreground, the Danube is seen pursuing its way through a flat country in an easterly direction, and here dividing Wurtemberg from Bavaria.

Descending from the tower, we enjoyed a pleasant walk along the long line of ramparts which hem in the town on the side of the river. It was my first interview with the Danube, and I was correspondingly interested. Coming apparently out of a hilly region on the west, the stream, in this its upper part, was already as large as the Clyde at Glasgow, but of a dingy white colour, and too rapid for any other navigation than the floating of rafts of wood to the low country. A steamer some time ago was attempted in vain. The fierceness of the current, and shifting character of the sandy bottom, have prevented steamers carrying on a trade higher up than Donauworth, a day's journey below Ulm; and I would recommend no one trying to steam down the Danube before reaching Ratisbon, whence the boats are large and commodious. Next day, in crossing the bridge into Bavaria, we could not help looking back on Ulm with a degree of compassion. Considered as the key of Austria, it may be said to be at present the furnace of military operations—its beautiful environs becoming dotted over with fortresses, and its fine river shut out by an odious thick wall. So, in order that the cabinet of Vienna may sleep in peace, the poor Ulmese must be confined to a species of prison, and breathe a foul atmosphere instead of the free breezes of heaven!

There was no stoppage to examine passports or baggage in entering Bavaria; and we jogged on in our voiture to Augsburg—country undulating, and well cultured and wooded—the peasantry, men and boys, dressed in long coats and ample jack boots, as if there was a scarcity in neither cloth nor leather. At a glance, on entering Augsburg, as we wheeled through a decayed portal, at which a Bavarian soldier stood sentry, we saw we had got into a curious old city, and the oddity was not diminished on acquaintance. We of course took up our quarters at the Three Moors, a hotel of princely dimensions, in the Maximilian Strasse, one of the most ancient and princely streets in Europe. An inn of the same name had been on the spot five hundred years ago, and, from all appearance, the present edifice is from two to three centuries old. Pertaining to the establishment in its original state, is the room which accommodated Charles V. Our apartment, large and lofty, commanded a view of the great long street, ever dull and solemn, with its windows universally closed with jealousies in defence against a sun of overpowering brilliance. It is only justice to say that the Three Moors is one of the very best inns on the continent.

We were several days in Augsburg, and had the pleasure of driving out daily under the guidance of an

old Chelsea pensioner, a German, who had been a sergeant in the British service. By this chatty veteran we were introduced to a knowledge of the place, and hauled into a variety of odd holes and corners—churches, convents, and places of historical note. Augsburg is evidently but the ghost of what it was—a town of the middle ages, kept up, as it were, to satisfy archaeological curiosity. Once a free city, with a reputation for artistic talent, and the great emporium for the interior of Germany, it suffered a decline, along with Nuremberg, and various other cities, owing to the discovery of the route to India by the Cape of Good Hope. This discovery threw Venice out of the richest trade in the world, and Augsburg and her other depôts fell in consequence. To the religious wars of Germany it also owes some of its misfortunes; and Bonaparte terminated its independence—at the time very little worth—by constituting it a provincial town of Bavaria. It has still a few manufactures, but its chief attractions as a place of residence seem to be its perfect silence and the cheapness of living. The houses are generally huge in size, exhibiting marks of faded grandeur. The fronts of several have at one time been covered with frescoes representing historical subjects; and these paintings, partially obliterated by the weather, testify the former wealth of the city, and the vicissitudes to which it has unfortunately been subject. The town is spoken of as having still some influence in money dealing; though, if this be the case, the trade is carried on in anything but that open and liberal manner we are accustomed to in England. The principal banking establishment, which I had occasion to visit, more resembled a prison than a place of business. The money-room was a gloomy vault, in which, within a railing of iron bars, in the midst of dark iron-bound chests, each garnished with a padlock as large as the crown of my hat, ministered the genius of the place with a gravity and importance worthy of Pluto. My business was to relieve him of twenty pounds, which I carried away in the form of a sackful of florins—gold not being obtainable for love or money! After visiting such terror-struck concerns as this, one feels wonderfully pleased with the spectacle of bank interiors in England—a row of affable tellers behind mahogany counters, with great heaps of notes and sovereigns laid fearlessly before them, as if there was no such thing as covetousness in the world.

One of the chief lions of Augsburg is a long white-washed house of no great mark, bounding the extremity of an open space, in which stands the cathedral. This house, once the palace of the bishop, now used for government purposes, is that in which the celebrated Confession of Augsburg was presented to Charles V. Some other spots, interesting from their connection with the Reformation, are pointed out in the neighbourhood. The town is now pretty equally divided into Roman Catholic and Protestant; but I am glad to say, on the faith of our conductor, that exasperation on the subject of religion has long since disappeared. Perhaps the religious wars and other misfortunes of the country had the good effect of inspiring mutual respect and toleration. In a back street near the cathedral, we visited the printing-office of the famous 'Allgemeine Zeitung,' or Augsburg Gazette, and had an interview with one of the editors. The paper, which has a circulation of about fourteen thousand, and is the most popular journal in Germany, is printed by several smart steam presses.

Augsburg will by and by be connected with the principal cities of Germany by railway; but at the time of our visit, the line was completed only to Munich, a distance of rather more than forty miles, across a flatish country. The whole mechanic of the line seemed excellent, and the fares about one half of what they would be in England or Scotland. The price charged for a place in a superb first-class carriage is equal to four shillings—baggage a few pence additional. The fuel employed by the locomotives is peat, of which we saw large quantities preparing in the line of route.

It is hopeless to give an account of Munich, such as it deserves, in a less compass than a volume. I can point only to a few of its leading features and objects of interest. Situated on a plain on the banks of the Isar, it consists partly of an old and little-improved town, and partly of modern erections. The newer part, which stretches away from one side of the old, is mostly the creation of the last thirty years, and has been the work of the present king, Ludwig (Louis) I. The expense lavished on buildings and embellishments has been immense, but a large portion, I was informed, has been defrayed from the private revenues of the king. There can be no doubt whatever that Ludwig is the most munificent patron of art in the world; and his taste equals his munificence. A walk through the newer part of the city overwhelms one with the variety and costliness of the creations which have sprung up at his bidding; and we feel that to his principal architect, Von Klenze, the highest merit of a designer and adapter is due. The streets are mostly arranged in long lines at right angles to each other, and are lined with public and private buildings of a lofty and imposing character. The style of the private houses is chiefly the Italian (families living in floors); while that of the public edifices is more varied; but the Byzantine, modified in many agreeable ways, prevails. There cannot, indeed, be said to be any originality. Greece and Italy have given models for almost everything in Munich; yet it would be unjust to say that this diminishes the pleasure which is derived from seeing so fine an assemblage of works of art. A number of the buildings are of sandstone, but the greater proportion are faced with cement. The centre of attraction is the Ludwig's Strasse—a long street of noble width, in which are many of the finest public buildings—palaces, churches, the Library, Blind Asylum, the University, &c. The interiors of the churches are superbly decorated with gilding and frescoes; the latter exquisitely beautiful, representing Scripture subjects. Cornelius has been the principal painter of these frescoes. In the church of St Lewis is one of his productions, a fresco painting of the Last Judgment, of the enormous height of sixty-four feet. The Basilica of St Bonafacius, a church (red brick, of fanciful arrangement) in the Karl Strasse, was finishing at the time of our visit—its seventy-two marble columns supporting a roof of blue, dotted over with gold stars; its marble floor, its frescoes, and other decorations, transcending in splendour all that had previously been attempted.

This and other churches we took in our way to two edifices which constitute the glory of Munich—the Pinacothec and Glyptothec. The Pinacothec, so called from a Greek word signifying repository of paintings, may be styled the national gallery of Bavaria, for it contains the largest and most select collection of works of pictorial art in the country, and, like everything else, has been given to the nation by the king. It is open to the public without fee or inquiry. The building is a large and beautiful edifice of sandstone, isolated on all sides; and the interior, one floor up, consists of nine magnificent halls, lighted from the roof, with twenty smaller side-apartments for cabinet pictures, lighted by ordinary windows. The pictures in the great halls are arranged according to schools. We have first the hall of the royal founders, with pictures of the present king and his predecessors; then we enter, second, a hall devoted to pictures of the German school; the third, the same; the fourth is devoted to the Dutch school; the fifth, which is about double the size of the others, is the hall of Rubens; the fifth is also the Dutch school; the sixth the French and Spanish schools; and the seventh, eighth, and ninth, the Italian schools. The paintings in the side-cabinets are likewise arranged according to styles and eras, but they do not require to be particularised.

A walk through the Pinacothec cannot fail to have an inspiring effect on all lovers of the fine arts. Large and small, we have presented to us a selection of fifteen

hundred pictures, the productions of the first masters of their craft; while the very taste with which they are accommodated, is in itself a thing commanding our admiration. As is well known, the collection is rich in the works of Rubens; but those which gave us the greatest pleasure were some of the pictures of Murillo, of which there are a few of great value. We visited this magnificent institution several times during our stay in Munich, on each occasion loitering for hours on the seats scattered about for the accommodation of visitors, and discovering new beauties in the collection.

The Glyptothec is a similar establishment for sculpture, ancient and modern. Its elegant Ionic portico of white marble; its highly-finished scagliola walls; the roofs of its halls green, white, and gold; its marble floors—all must be left to the imagination of the reader. It is divided into twelve halls, each devoted to a distinct class of sculptures; as, for example, the halls of Egyptian and Etruscan antiquities, the hall of Grecian sculptures of the era of Phidias, the hall of Heros, the hall of Roman sculptures, and the hall of modern masters. Inferior in extent or in value to the collection in the British Museum, there is nevertheless here much to delight, from the great care and expense lavished in making the exhibition commodious, classic, and therefore unexceptionable, in point of taste. Many of the ancient figures have been restored in part by Thorwaldsen; and after having seen some most objectionable mendings of this kind at Dresden, I cannot but give the greatest praise to the artist who has performed this delicate duty for the Glyptothec. In the hall of modern sculptures are some exquisite pieces by Canova, Thorwaldsen, Schadow, and Rauch—the latter at present the greatest sculptor in Germany, and of whom I shall have occasion to speak on arriving at Berlin.

After paying visits to the foregoing lions, the stranger usually proceeds to the palace of the late Duke of Leuchtenberg (Eugene Beauharnois), where there is a gallery of paintings, and also some sculptures of considerable value, which are shown to the public. On the occasion of our visit, the crowd here was much greater than at any place where we had yet been. Instead, however, of noticing the beautiful works of art in this collection, I shall cross the broad Ludwig's Strasse, and conduct the reader to the precincts of the royal palace. Here, on one side of the king's residence, is the Hofgarten, a large square enclosure, plentifully dotted over with trees, under whose shade, and also in an arcade, which runs along two sides of the ground, is the great daily lounge of the inhabitants. The arcade, in its whole extent, is decorated in the inner side with frescoes illustrative of Bavarian history, and other subjects. This method of telling a nation's history by the pencils of the most eminent artists, is surely one of the best means of cultivating popular feelings: we have, in fact, here a long series of pictures of high art in an open public promenade, but protected from the weather by the roof overhead. The king has been the presiding genius of this novel gallery, and some of the frescoes are adorned with poetical mottoes from his pen. Adjoining the Hofgarten is the entrance to the English Garden, a large park laid out with wood and water. This was one of the useful works of the celebrated Count Rumford during his residence in Munich.

On the opposite side of the Hofgarten is the new royal palace, an edifice of fine sandstone, presenting a Grecian front of eight hundred feet. Behind, and partly in connection with it, is the old palace. We made two several visits to this extensive suite of buildings, in which German art has done its utmost to unite the classic style of Pompeii to that of modern Italy. The state apartments are a succession of superb halls, for the greater part painted in fresco, or with walls of scagliola, and having floors of the finest inlaid wood, of divers colours. The throne-room may be considered the grandest thing which human art can reach—floor of polished marble, from each side of which rises a row of twelve lofty columns with gilded capitals. Between

these columns are placed colossal statues in bronze, but gilded all over, representing the most illustrious ancestors of the reigning monarch, and after models by Schwanthaler. This magnificent saloon, which is in length 112 feet by 75 feet in breadth, and 57 feet high, is further enriched by frescoes picturing incidents in the works of the Grecian poets, surrounded by Romanesque borders. A gorgeous throne, draped with crimson-velvet hangings and gold, occupies the upper extremity of the floor.

Adjoining the new palace stands the chapel-royal, for which likewise marble, gold, frescoes, and scagliola, have done their utmost. The encaustic paintings on the roofs of the different compartments are among the finest things I have ever seen—that of Christ blessing little children leaving an impression on the mind every way becoming the subject. In this, as in all the other places of worship visited by us in Munich, we observed persons of the poorest class in attitudes of devotion—women of the humblest rank in life, with their children about them, being seen kneeling in the midst of splendours such as are reserved exclusively in England for individuals occupying the highest stations. Without drawing the slightest inference unfavourable to the religion of our own country from this circumstance, I feel impelled to remark, after some experience in church-seeing, that the perfectly free entrance, at nearly all hours, to highly-embellished places of worship on the continent, must have in itself, and apart altogether from any question as to devotion, a useful effect in cultivating habits of veneration and respect—respect for works of art, and a love of what is beautiful. The absence of all means, secular or religious, for exciting into activity a similar class of emotions in the humbler orders in England, and most of all in Scotland, has produced fruits which it is unnecessary to particularise.

Magnificent as was this chapel, and the halls of the palace of which it forms a part, we had reason to be more interested in what was still in reserve—a visit to the old, or, as it is called, the *Rich* chapel, which is reached by a gallery from the more ancient part of the royal residence. Apparently unused for any religious service in the present day, this little old chapel, which consists of one apartment, about fourteen feet square, and which could not well hold more than a dozen people, was founded by the Elector Maximilian I. It may be described as one entire gem, consisting of a combination of precious stones, pearls, gold, silver, ebony, ivory, and other costly articles—a treasury to which each successive prince has given a contribution. The roof is of lapis-lazuli, the floor of marble, and the walls Florentine mosaic. At the entrance are a few antique seats, and on the left-hand side a small organ with silver pipes. The objects to which attention is drawn by the exhibitor are six cupboards of ebony, adorned with coloured stones. One by one these are opened; and their contents, consisting chiefly of vessels in gold and silver, and reliquaries, are explained. In one were the skulls of four popes, set in velvet and pearls; also the hands of four saints, dried and brown like shrivelled mummies. Another reliquary contained a bone set with precious stones, and another a circular piece of skull as large as a crown-piece. The contents of five presses having been exhibited, each article involving curious points in personal history, we came at last to the sixth press, adjoining the entrance. The objects brought into view on opening the doors, were described as of the greatest interest, and the spectators, with eager eyes, crowded closely round the exhibitor. Taking from one of the shelves a small article of about four inches long, three inches broad, and half an inch in thickness, resembling a lady's card-case, the general interest became quite impassioned. Removing the exterior case, which was of ebony, we held in our hands the altar-piece used by Mary Queen of Scots at her execution. This great curiosity, which had come into the possession of the Bavarian family, and whose history is of undoubted authenticity, is of

silver gilt, enamelled with green and other colours. Nearly square in form, it opens in leaves, so as to form two side-wings, with a part above the centre, making three leaves in all. Thus expanded, it presents miniature paintings of Scripture subjects in the style of the fifteenth century—the last things on earth, it may be supposed, on which had rested the eyes of the unfortunate Mary Stuart.

W. C.

HANNAH WHITE;

A SKETCH OF IRISH HUMBLE LIFE.

BY THE AUTHOR OF 'MY FATHER THE LAIRD,' &c.

It was an agreeable change to Hannah White, after the scene of discomfort in poor Biddy's desolate cabin—described in our last number—to pay an occasional visit to her foster-father's 'snug little piece of a farm,' which lay all along down the sunny slope of a low hill. It was a narrow strip, descending pretty equally, between well-marked double ditches, from the furzy summit to the meadow by the river side. Old Luke White, or rather Terry* White, old Luke's son, held about three-and-twenty Irish acres of good land, ill cultivated, neither weeded, nor drained, nor rightly fenced, nor properly cropped, yet profitable, even under his untidy management, from the small rent he paid for it, and the light burdens it was taxed with. He would have made more of it had he possessed it unencumbered; but there were several roods, and even half-acres, and an acre each patch, with a ruinous cabin belonging to it, which he had sublet to different paupers, or in a few cases had, more correctly speaking, suffered to remain with the original tenant of a larger proportion, who had been at some fitting opportunity 'bought out of his holding.' In Hannah's time, her foster-father had never owned above six or seven acres, on which he had contrived to bring up a large family very creditably; for he had been an active man, of frugal habits in his working days, and a 'simple' man, busied merely with his own small affairs in all honesty. The English hardly understand the Irish interpretation of this 'simple' word, although Miss Edgeworth has done her best to explain it to them in one of her delightful children's tales. The son, Terry, exemplified the converse of the meaning given to it by his countrymen to perfection. He was a very different character from the father—people said he had 'a strong dash of the mother in him.' Lounging through the world in the most sleepy way, with his eyes apparently half-shut, no one saw more clearly all that was going on around him; no one knew better how to 'bide his time,' and act at the fitting moment for his own advantage. He was greatly admired by his neighbours for his quiet abilities. To be as 'cute an' knowin' a'most as Terry White,' was high praise of any 'endeavouring' young man. He had thus, in his own easy way, nearly tripled the size of his holding, gaining credit all the while for helping the distressed, by coming forward at the critical hour when the wonderfully-enduring powers of his race could bear no more. While he relieved the unfortunate both of land and difficulties by means of his closely-kept purse, he spared himself the odium of removing the family of the outcasts. He had permitted them always to remain in the cabin built by themselves, and given a bit of ground adjoining, charging for the same, however, a rent that nobody talked about, and which was generally taken out in labour.

Terry White's most ardent admirer was his wife; for he had married, though not early, a woman made expressly for himself, young, but not young-looking, quiet, managing, home-keeping, an adept in getting one drop more out of what he imagined he had already squeezed dry. She had brought him money too—money and stock—otherwise it is more than probable she would not have been solicited to come herself. She brought a

* Short for Terence.

cow, a heifer, a sow, a store-pig, two turkey hens, a piece of frieze, a fur-tippet (which she wore on Sundays over a real cloth cloak, all the year round, summer and winter alike), and forty sovereigns wrapped up in the heel of an old stocking. She was quite a mountain heiress, although, in her frequent allusions to her fortune, not an item of which she ever neglected to enumerate, she always modestly summed up its amount as a 'trifle.' This managing couple had, by imperceptible degrees, while accumulating stock and acres, contrived to get rid of all encroachments on either. Sisters and younger brothers had passed out from their childhood's home to struggle with the crowd of necessitous around them, leaving only the old man behind. In their place, a set of fine healthy grandchildren filled the house, recalling by name and features those of a former generation at their age.

Hannah's first visit impressed her favourably with all she found. Terry and Terry's wife vied in their attentions to her. The old man said little, but he looked on her with much affection as he rose from the comfortable settle within the large open chimney, of the kitchen, displacing a baby from each knee, that he might reach to shake hands with her. The place looked very much as it used to do. The entrance was at once into the kitchen; it would have been into the fire, but for a wall that was run out at right angles from the chimney back some feet on along the floor, facing the door, and cutting it off, in fact, from the room, forming a small square lobby, which would have caused nearly total darkness at the fireplace, had it not been avoided by a window of a single pane made in this bit of wall, close above old Luke White's head, as he sat on his usual seat within. The floor was clay, hardened by a slight mixture of lime and sand. The thatched roof was unceiled; but all was tight, and dry, and clean, and the walls were neatly whitewashed. The old plain furniture was there: nothing having, to all appearance, been added to it. A turned-up table leaf was near the fire, let down for every meal, as in long past days. The dresser stood opposite, well filled with crockery of all shapes and sizes. Along its lower shelf was ranged a whole row of wooden bowls and platters; and on the upper shelf still shone, what had been the pride of Hannah's foster-mother's heart, pewter-ware, which had descended to her from a long line of ancestors. A long ironing-table followed, before which Hannah had many a day stood till her strong back ached; bright tin-cans hung on the wall behind it; an eight-day clock faced the small window; a settle bed, a large wheel for spinning wool, some stools, tubs, and a turf basket, bottom upwards, under which a hen was hatching, completed the furniture of this 'small farmer's' comfortable kitchen. At either end of the house was a room, clay-floored, and unceiled like the kitchen, from which one of them, indeed, was only partitioned off by the dresser. In this more open apartment slept the old man, the maid-servant, and the elder children. In the other private retreat, with the chimney-stalk and the lobby to separate it from the rest of the house, slept Terry, his wife, and the babies. The old man's room contained nothing but two bedsteads: his son's not much more—only a cradle, a press, and a very dingy mahogany table, and a chair or two to match; extra with sundry boxes, bags, band-boxes, and bundles, heaped on the top of the bed and the red-painted press. Nothing more in sight, we should have said; for Mrs White, when doing the hours of her house, by showing off to her husband's friend all its treasures, drew out, with no little pride, from underneath the bed a small barrel full of eggs, and a large tub half full of beautiful butter. She was very particular, she said, in her dairy management, butter being in these times as good as gold. She had seven cows, and no right dairy; no dairy with a right lock: she therefore kept her butter where no fingers but her own could reach it. Our Scotch and English readers might suppose the cream to have been in equal

danger; but in the dairy husbandry of the part of Ireland we are describing, they do not deal in cream—the milk is all strained at once into a large churn-shaped vat, warm as it comes from the cow: the operation is repeated at every milking, till the vat is full, when two men relieve each other in churning the ripened milk into butter. The buttermilk sells readily in the neighbourhood; the butter is packed for market. Mrs White's milk-vat stood in a dark corner partitioned off from the barn, which barn being partly open, served occasionally as a cart-shed and general tool-house, when it occurred to Mr White to shelter articles of such value from the weather. The partition was merely brushwood closely wattled, and overhead some yards of calico were nailed across the rafters, to prevent rubbish from falling below. The brick floor, the white walls, the shaded window, the cool shelves, loaded with pans of richly-coated milk, the curd, the cheese, the beauty, the profits of a British dairy, when will they be universal in the sister isle, where, of all farming, dairy-farming should best thrive, from the quality of the pastures, and the short mild winters of the country?

Unknowning of these better things, Mrs White was quite content; vain even of her untidy premises, her pigs ranging over the fields, her fowl laying their eggs under the haystacks, her garden as full of weeds as of vegetables, the bawn* ankle deep on wet days, and miry at the driest of times, from the constant tread of the cattle on the refuse thrown there for the purpose of being thus prepared for the manure heap. She grieved, indeed, over her many troubles—her 'slaving life, her crosses, losses, great expenses, little profits, heavy rent, and heavy cess, and more than all, her difficulties with Terry, who was entirely too good-natured, failed in bargain-making, was for ever giving to this brother and to that sister, Biddy included, and showed himself in many ways too innocent for the world he lived in. These complaints required no redress, scarce even a reply: they were a habit rather than a necessity; not called forth by any real evils, merely adjuncts to the dignity of her station as a prosperous farmer's wife. That there was any merit wanting in herself, had never occurred to her, nor was it in the nature of things that it ever should. Though she admired the character of her husband, she did not by 'any manes consider him her equals.' Her father held forty acres of land, and her mother went to chapel in her jaunting car, and her brother rode his own horse at the steeple-chases. Terry could pretend to no such high doings; but he was 'snug,' and good-looking, and 'cute,' and the best match that offered for her at the time her parents judged it fit she should be disposed of; and 'she had never repented, thanks be to God for that and all his other mercies! She did not fault him (the husband), nor complain of him, nor any one, but Hannah herself must have the sinse to see that he was by no manes her equals.' Terry seemed to see it, and to feel it too, for her word was law to him. He paid her implicit obedience, and readily, as if her commanding thus was an honour to him; and in his private conversations with his foster-sister, he dilated warmly on his wife's perfections: 'The best of creatures!—the finest housekeeping woman!—the hardest† woman in all Ireland!—the nicest‡ hand at a bargain! They would need to be 'cute indeed that offered to have dealings with the like of her!' He was evidently delighted with his prize, lived but to serve her, came and went as she ordered, lounged after his lounging workmen when she sent him, or indolently, at her bidding, set half to rights what they had wholly neglected. He bought and sold only by her directions; and being both of one mind as to spending nothing they could spare, and pocketing all they could contrive to make, they got on very comfortably together; except at an odd time of a fair day, when Terry, not having

* Yard before the door. † A good bargain-maker.

‡ Shaving close.

taken the temperance pledge, had been 'after' refresh-
ing himself too frequently. They were really decent,
well-doing people after their lights; paid priests' dues,
cess, rent, and rent charge—'kept themselves,' as they
said, 'to themselves, and had no call to nobody.'

Subsequent visits hardly kept up these agreeable im-
pressions: a more intimate acquaintance with the ways
of the house revealed a style of management ill calcu-
lated to satisfy the judgment of the active little woman,
who had been disciplined by many years' service, under
conscientious employers, into the most perfect regula-
tion of her time, and the most faithful discharge of her
duties. Terry White cultivated his farm at no great
expense of labour: his cabin tenants did his work 'ac-
cording as he happened to want 'em'; no man had his
particular business, no hour its allotted task; the whole
concern went on at haphazard; the pay, poor as it
was, was very grudgingly given—the work returned
for it was very lazily done: conscience seemed to be
wanting on both sides: the men could hardly be trusted
out of their master's sight a moment: his time, indeed,
was principally occupied in watching their doings, for
suspicion dwelt ever among them all. He gave better
wages than some of his neighbours—a fact on which he
sufficiently prided himself: he gave sixpence a day and
diet; but there was a long per contra account, so long,
that little money passed between them—there was cabin
rent, garden rent, potato rent, and cartage of fuel, for the
husband's share; and the wife and Mrs White had their
separate account for buttermilk. This being, by the
custom of the country, the perquisite of the farmer's
wife—part of her private fund for the purchase of such
luxuries as tea and clothing—she reckoned her quarts
very carefully. They were paid for either by a few
days' work in harvest, or in copper, as they were got—
the copper being earned by the sale of eggs from the
fowl, permitted to pick about over the fields at will,
except when they ventured near the corn. Yet with
all their carefulness, all their hard dealings, Terry and
Mrs White were about this time beginning to feel that
they were not rich. The fund in the stocking heel
had diminished, for they had been obliged to apply to
it once or twice in seasons of difficulty; their children
were increasing in age and numbers, and not being
brought up to help in any industrious way the business
of the family, they were an annually additional charge,
instead of becoming an assistance. Terry scraped and
shaved closer than ever; the parings and pinchings
of Mrs White were felt to the heart's core by every
member of the household; still matters mended little.
That they had themselves to blame, that for want of
outgoings, they could hardly expect incomings, never
crossed the thoughts of this self-satisfied pair: self-
blame never does cross the thoughts of Irishman or
Irishwoman. The times, the seasons, landlord, agent,
master, mistress, friends, neighbours, anybody, any-
thing, everybody, everything, deserves high blame, and
gets it, all but those only who are in fault—the in-
dividuals whose indolence prevents their making the
slightest exertion of mind or body to better their own
condition.

Hannah ventured to suggest that a little more ac-
tivity, a little regularity, some attention to order and
tidiness, some improvements on the methods of farming
pursued by Terry, would be rewarded by increased pro-
ductiveness, and would lessen the necessity for much of
the niggardly proceedings which so exceedingly dimi-
nished the comforts of his family. But she found her
hints far from kindly taken. So far from having ne-
glected a proper outlay on his 'little piece of a farm—
the worst bit of land, take it all out, that he would en-
gage to say would be to be found in the country'—her
foster-brother assured her 'that he had done a power.
Ne'er a man in all Ireland would have done as much,
or could, had he been willing.' He had 'bought three
pounds of powder, and blasted two astonishin' rocks in
one field;' he had 'drawn forty barrels of lime three
miles—'crass the river, up the hill—and put them all out'

on another field; he had 'sowed dales,* fine three-year
oulds, five score o' them'—all along in a row, down the
top of the double ditch he had made betwixt himself and
his next neighbour, 'the contrariest man was ever seen,
for ever poundin' an' annoyin'. What man alive could
do more, or as much? But the times bate him intirely.
He was shuck with 'em, and sure it was no use strivin'
agin' 'em.' Mrs White had been equally distinguished
on her side. She watched, and she worried, and she
scrimped herself and every one. She turned away a
good, strong, active maid-servant, 'an' took up wid jist
a slip of a girl' in her stead, the daughter of one of
their cabin tenants, to whom she gave no wages, and
from whom, in return, she got no work. She withdrew
her two eldest children from the school she had hitherto
sent them to, 'an' striv' to tache them herself on an
evening.' She had no idea of making money but by
sparing it—inflicting really a course of privations on
herself and all belonging to her as her only resource in
these 'stroogling' times. 'My dear life,' said she, ad-
dressing the foster-sister—'my dear jewel, it's little
you know. What with the roads contractin', and them
wars, and one thing and another, it was asieer to make
a guinea in the ould times than a penny now.' The
conclusion to which this unpromising condition of
their affairs had brought this contriving couple was,
that Hannah, with her grand friends, and her fine
place, and her 'hapes of savings,' was to take it upon
herself to provide for all their children. It would
be unnatural to expect otherwise, for who else had
she to look to? Them that 'raired her had a right
to dipind upon her;' and she had equal 'right' to
afford her best assistance to them. Hannah had no
wish indeed to deny it. She had never forgotten the
care taken of her childhood, never omitted to send
many useful remembrances to the only home she could
look back to; nay, she had come now to the country
for the express purpose of seeing what could best be
done to advance the fortunes of her foster-mother's
family; but she did not exactly incline to be their sole
dependence; and she also began to fear that they might
not all perfectly agree as to the means to be adopted.
Her wish was, to educate the children, and by enlighten-
ing the parents, endeavour to elevate the condition of
Terry and his family. Mrs White had no notion that
either she or her husband had anything to learn;
for they were, in fact, in some respects rather in ad-
vance of their neighbours: no intention of making
herself, or encouraging her husband to make, the very
least exertion to further their object; still less did she
purpose to spend a farthing of their hard-won money
on it; neither did she imagine that their children could
require aught but the 'help of a friend' to fit them for
every sort of creditable employment. She therefore
expected Hannah to use her interest to provide them
all with such situations as she had fixed on for them,
'accordin' as they grew to years.' She had 'laid out'
to get places in the police or the Excise for her sons,
and to make ladies-maids and dressmakers of her
daughters, without further trouble to her or their
father. She did not mean them to be 'kilt with work:'
she was come of 'dacent' people—Terry was come of
'dacent' people too; their children had had 'the best of
rairin'—' never let out with the common sort,' &c. &c.;
and when she found that Hannah was sceptical on
their merits, dissatisfied with their idle habits, their
insubordination, and their lack of the most ordinary
instruction, and was resolute not to importune her
master and mistress for their patronage in favour of
connexions not previously fitted to deserve it, her
manner changed entirely to the friend she had up to
that moment made so much of. She did not cool—she
heated; words, actions increased in vehemence as she
worked herself up to resent this unnatural indifference:
all former kindnesses were obliterated. Hannah was
thankful to escape from the house with a whole skin,

and to leave the future welfare of the family to time, and the changes time would bring.

Thus ended Miss White's visit to the scene of her early days. She felt that she could be of as little use to her comfortable foster-brother as to her miserable foster-sister; that were she to continue any close connection with either, she might herself be ruined between them, brought down to Biddy's level, another pauper among the crowd of wretched, without a hope of ever raising them to her own position. She therefore determined on restricting her intercourse with Mr and Mrs White to little occasional civilities, as better in the end for them, and essential to herself for her own respectability. Her heart was hardly as light on her homeward journey as when the hope she brought with her to the hills had filled it; but she was content with the feeling of having done her duty: she had satisfied herself that she had shewn herself not ungrateful for the home given to her childhood; and for the rest, forty years in this struggling world had inured her to disappointment.

THE IPSWICH MUSEUM OF NATURAL HISTORY FOR THE WORKING-CLASSES.

SOME months since,* we abridged from the 'Manchester Guardian' a very interesting memoir of James Crowther of that place, a naturalist in humble life, including notices of some of his companions who had united with him to form a society of about forty weavers and mechanics, who met occasionally to exhibit and compare their acquisitions of plants and insects; and we added some observations as to the great desirableness of similar tastes being more widely imparted to the working-classes by making natural history a branch of their education. A step in this direction has since been made by the adoption of Mr Patterson's 'Introduction to Zoology' in the schools under the National Board of Ireland, and in several public and private seminaries in England and Scotland; and we are now happy to add, that a Museum of Natural History, of handsome architecture, lately erected, of which the professed object is to communicate a knowledge of this science to working-men, was opened at Ipswich on Wednesday, December 15th, by eloquent speeches from the Bishop of Norwich, the Dean of Westminster, Sir J. P. Boileau, Bart., &c. addressed to a large auditory, comprising some of the principal gentry of Suffolk, the members of parliament for Ipswich, and numbers of the inhabitants of the town of all ranks. The president of the Museum, the Rev. W. Kirby, rector of Barham, near Ipswich, now in his eighty-ninth year, was present; but in consequence of his great age, the Bishop of Norwich officiated as president in his stead, and moved, at the conclusion of the meeting, a vote of thanks to him for the valuable services he has rendered to natural history during his long life, to which the venerable father of entomology in this country replied in a brief and most affecting valedictory address, which brought tears into the eyes of most of those present. This Museum, as stated in the 'Suffolk Chronicle,' now before us, owes its origin chiefly to the indefatigable zeal and unwearied exertions of George Ransome, Esq., of Ipswich, proving, as in so many other instances on record, how much may be effected by a single individual; and as the Messrs Ransome of that place, who employ many hundred men in their extensive manufactory of agricultural implements, &c. will use their influence to induce them to attend the lectures meant to be given, there is every prospect that this institution will succeed in its great object of introducing the working-classes of Ipswich to what is yet so great a desideratum in all plans for their advantage—a new description of out-of-door recreation, at once healthy and rationally exciting in a very high degree. For how intense must have been the delight derived from their

pursuits, which, as we learn from the memoir of Crowther above referred to, could lead him and his comrades, after a hard day's work, to walk ten or fifteen miles in search of a rare plant or insect! To many even well-informed minds, the idea of directing the attention of working-men to such pursuits seems absurd and impracticable; and so it would be, if the aim were to make them profound naturalists. But this is not the intention. It is simply to give them such a taste for, and general knowledge of the subject, as may lead them to take an interest in observing and collecting the natural objects which present themselves so profusely in every walk, and comparing them with similar ones deposited in the museum or described in books, and thus ascertaining their names and properties, and being able to explain them to their children. Every one remembers Mrs Barbauld's charming tale of *Eyes and no Eyes* in 'Evenings at Home,' containing the history of two boys taking the same walk, in which one found nothing to observe, while the other was attracted by novelties at every step. And so it is with working-men. The great mass of them never having been taught 'the art of seeing,' find nothing but barrenness and weariness, where instructed men, like Crowther, are in ecstasies of delight. Such is the force of the principle of imitation in man, that let but one or two in a place acquire a taste for any branch of natural history, and numbers will be sure to follow their example; nor will the scientific naturalist quarrel with these humble disciples, if, stopping far short of his knowledge of the subject, they content themselves with merely collecting and admiring the objects with which nature presents them. No botanist, however profound, refuses to smile with complacency at the rapture with which the critical eye of a Norwich weaver hangs over the points of beauty and perfection in the flowers of his auriculas and polyanthus; and no ornithologist would disdain to enter into the feelings of the Spitalfields weaver, who pointed out to him, with exultation, his matchless 'croppers' and carrier-pigeons, which he had reared with such anxious pains and skill. Nor does the entomologist refuse to sympathise with his brethren of the same locality, whose great ambition in collecting insects is to arrange them so as to form a symmetrical 'picture,' in a glazed frame, to hang up in their parlour. These humble collectors of insects often find species not before known; and many of the rarer ones of Mr Haworth's 'Lepidoptera Britannica' were obtained by him from the Spitalfields weavers, to whom he paid frequent visits.

But independently of this consideration, however restricted may be the views of naturalists in humble life, what can be more desirable than to direct their attention to objects which, apart from their beauty and marvellous structure, as the works of a Divine hand—works which, if He thought it worth while to create and adorn, must be worthy of our study and admiration—must even merely, as presenting matter for constant interest, largely promote their happiness? Gray the poet well observed, that the enjoyment of life depends on our 'having always something going forward,' exclaiming, 'Happy they who can create a rose-tree or erect a honeysuckle; that can watch the brood of a hen, or see a fleet of their own ducklings launch into the water!' And it is precisely thus 'having always something going forward,' that constitutes the charm of their pursuits to the humble florist, who fosters with assiduous care the growth of his seedling auriculas, and watches with intense eagerness the first expansion of the hoped-for prize-flower; and to the butterfly and moth collector, who daily feeds his rare caterpillars for weeks with their appropriate food, sees them at length with joy change into their chrysalis state, and then impatiently expects their transformation into the perfect insect. No man knew better than Crabbe (himself, by the way, like Gray, an entomologist) how largely the happiness of the working-classes, with whose wants and feelings he was so well acquainted, can be increased by giving them a taste for even the humbler depart-

* Journal, No. 170, p. 215.

ments of natural history—a conviction strikingly conveyed in the lines in his 'Borough,' which run—

'There is my friend the weaver; strong desires
Reign in his breast; 'his beauty he admires:
See, to the shady grove he wings his way,
And feels in hope the rapture of the day—
Eager he looks, and soon, to glad his eyes,
From the sweet bower by nature formed arise
Bright troops of virgin moths, and fresh-born butterflies.

* * * * *
He fears no balliff's wrath, no baron's blame;
His is untaxed and undisputed game.'

But though the Ipswich Museum will render no small service to the working-classes, if it should merely convert hundreds of them who now saunter in the fields, uninterested and without object, and to relieve the vacuity of their eye and mind, adjourn to the alehouse, into cultivators of flowers, rearers of pigeons, or collectors of insects, it by no means follows that much more important results will not follow from its establishment. Though the bulk of the Messrs Ransome's workmen may go no further, some of them, like Joseph Fox, the Norwich weaver, recorded by Sir J. E. Smith as the first grower of a lycopodium from seed, or Hugh Miller, the stone-mason, author of the excellent geological work on the 'Old Red Sandstone,' may render high services to science: and if this should prove the case in only one instance in a hundred of those to whom the Ipswich Museum gives a taste for natural history, and if the same result should follow from other similar institutions, which it is to be hoped its example will cause to be formed in all our towns, it is scarcely possible to estimate too highly the large accession of enjoyment which will be conferred on the working-classes, and of advantage to natural history from enlisting them among its cultivators.*

THE NIGHT SIDE OF NATURE.

THIS is the somewhat poetical name of a book† published for the purpose of rationalising the ancient, though of late exploded belief in prophetic dreams, spiritual appearances, and other mysterious things. What first strikes the 'candid reader,' is the amazing moral courage of the author: she, a novelist of some reputation, and a woman of the world, to come boldly out with the profession of a belief in what the intelligent public has long condemned as only fit matter for vulgar wonderment—even though she profess a philosophical object and a wish to fortify the conviction of the spirituality of our nature, and to elevate thereby our moral life—it must be acknowledged to be no common phenomenon in literature. A second feeling, on dipping into the book, will be surprise at the ripeness of such matters in these cool, unpondering days—so contrary to the common notion that they have disappeared along with the disposition to believe in them. It appears as if, while scepticism is the general profession, a vast number of persons had yet experiences which they could not resolve into accordance with the admitted course of nature, and which they are willing to disclose in certain circumstances, but always with an injunction as to concealment of names, lest they be suspected of a secret leaning to an unfashionable belief. These Mrs Crowe has determined to collect and arrange, with the view of endeavouring to bring them within the domain of science. 'Because, in the seventeenth century,' she re-

* When in our concluding remarks on Crowther's memoir, we observed, 'The common soldier, if acquainted in even a small measure with botany or entomology, would have at command a means of enjoyment which would make the dreariest of hours in foreign stations to him a paradise' (p. 217), we little thought how soon, and on how large and fearful a scale, our position would be verified by the fatal consequences of the want of some such recreation in the case of our troops in India, whose late general insubordination, and the consequent sad execution of several of them, is attributed by the editor of the 'Times' newspaper (Dec. 27, 1847), solely to the insupportable wearisomeness and ennui of being obliged to live in remote quarters, without any object to interest or occupy their attention.

† By Catherine Crowe. 2 vols. London: Newby. 1848.

marks, 'credulity outran reason and discretion, the eighteenth century, by a natural reaction, threw itself into an opposite extreme. Whoever closely observes the signs of the times, will be aware that another change is approaching. The contemptuous scepticism of the last age is yielding to a more humble spirit of inquiry; and there is a large class of persons amongst the most enlightened of the present, who are beginning to believe that much which they had been taught to reject as fable, has been, in reality, ill-understood truth.' If such a reaction be actually in progress, it is a fact of obvious importance. Perhaps the reception of the 'Night Side of Nature' will in some degree be a test how far it is a fact.

Our author starts with a chapter of speculation on the ideas which have been entertained regarding the inner spiritual nature of man. Adopting the doctrine of there being a spiritual as well as a fleshly body, she seeks to show how some faint gleams of its attributes may at times shoot up through the clay in which it has taken up its temporary abode; through this medium, she thinks, we may, under certain perhaps abnormal conditions, have communication with the spiritual world, so as to become cognisant of things above the apprehension of the bodily senses. Disease often supplies these conditions; mesmerism supplies them to some extent; so does common sleep; often, however, the communication takes place without any extraordinary conditions being observable.

Revelations by dreaming she takes up first, as being the simplest class of phenomena; and of these she presents a number of curious examples. Take as a specimen the following:—'Mr S—— was the son of an Irish bishop, who set somewhat more value on the things of this world than became his function. He had always told his son that there was but one thing he could not forgive, and that was a bad marriage—meaning by a bad marriage, a poor one. As cautions of this sort do not always prevent young people falling in love, Mr S—— fixed his affections on Lady O——, a fair young widow, without any fortune; and, aware that it would be useless to apply for his father's consent, he married her without asking it. They were consequently exceedingly poor; and indeed nearly all they had to live on was a small sinecure of forty pounds per annum, which Dean Swift procured for him. Whilst in this situation, Mr S—— dreamt one night that he was in the cathedral in which he had formerly been accustomed to attend service; that he saw a stranger, habited as a bishop, occupying his father's throne; and that, on applying to the verger for an explanation, the man said that the bishop was dead, and that he had expired just as he was adding a codicil to his will in his son's favour. The impression made by the dream was so strong, that Mr S—— felt that he should have no repose till he had obtained news from home; and as the most speedy way of doing so was to go there himself, he started on horseback, much against the advice of his wife, who attached no importance whatever to the circumstance. He had scarcely accomplished half his journey, when he met a courier, bearing the intelligence of his father's death; and when he reached home, he found that there was a codicil attached to the will, of the greatest importance to his own future prospects; but the old gentleman had expired with the pen in his hand, just as he was about to sign it.

'In this unhappy position, reduced to hopeless indigence, the friends of the young man proposed that he should present himself at the vice-regal palace on the next levee day, in hopes that some interest might be excited in his favour; to which, with reluctance, he consented. As he was ascending the stairs, he was met by a gentleman whose dress indicated that he belonged to the church.

"Good heavens!" said he to the friend who accompanied him, "who is that?"

"That is Mr ——, of so and so."

"Then he will be Bishop of L——," returned Mr

S—; "for that is the man I saw occupying my father's throne."

"Impossible!" replied the other. "He has no interest whatever, and has no more chance of being a bishop than I have."

"You will see," replied Mr S—. "I am certain he will."

They had made their obeisance above, and were returning, when there was a great cry without, and everybody rushed to the doors and windows to inquire what had happened. The horses attached to the carriage of a young nobleman had become restive, and were endangering the life of their master, when Mr — rushed forward, and, at the peril of his own, seized their heads, and afforded Lord C— time to descend before they broke through all restraint and dashed away. Through the interest of this nobleman and his friends, to whom Mr — had been previously quite unknown, he obtained the see of L—. These circumstances were related to me by a member of the family.

Akin to such cases are presentiments, a class of phenomena exemplified also in the lower animals. Many of these prove to be warnings against danger, and an instruction as to the means of avoiding it. For example—A few years ago, Dr W—, now residing in Glasgow, dreamt that he received a summons to attend a patient at a place some miles from where he was living; that he started on horseback; and that, as he was crossing a moor, he saw a bull making furiously at him, whose horns he only escaped by taking refuge on a spot inaccessible to the animal, where he waited a long time, till some people, observing his situation, came to his assistance, and released him. Whilst at breakfast on the following morning, the summons came; and, smiling at the odd coincidence, he started on horseback. He was quite ignorant of the road he had to go; but by and by he arrived at the moor, which he recognised, and presently the bull appeared, coming full tilt towards him. But his dream had shown him the place of refuge, for which he instantly made; and there he spent three or four hours, besieged by the animal, till the country people set him free. Dr W— declares that, but for the dream, he should not have known in what direction to run for safety. Mrs Crowe thinks that there is no need to suppose supernatural intervention in such cases. It may be only from some cause connected with the condition of the individual that the apprehension takes place—"an accident in the sense that an illness is an accident; that is, not without a cause, but without a cause that we can penetrate."

Mesmerism has some pretensions to throw light upon these mysteries, as will appear from the following anecdote in connection with one ensuing upon it. Two ladies, a mother and daughter, are asleep at Cheltenham, occupying the same bed. The mother, Mrs C—, dreamt "that her brother-in-law, then in Ireland, had sent for her; that she entered his room, and saw him in bed, apparently dying. He requested her to kiss him; but, owing to his livid appearance, she shrunk from doing so, and awoke with the horror of the scene upon her. The daughter awoke at the same moment, saying, "Oh, I have had such a frightful dream!" "Oh, so have I!" returned the mother: "I have been dreaming of my brother-in-law." "My dream was about him too," added Miss C—. "I thought I was sitting in the drawing-room, and that he came in, wearing a shroud trimmed with black ribbons, and approaching me, he said, 'My dear niece, your mother has refused to kiss me, but I am sure you will not be so unkind.'"

As these ladies were not in habits of regular correspondence with their relative, they knew that the earliest intelligence likely to reach them, if he were actually dead, would be by means of the Irish papers; and they waited anxiously for the following Wednesday, which was the day these journals were received in Cheltenham. When that morning arrived, Miss C— hastened at an early hour to the reading-room, and

there she learnt what the dreams had led them to expect: their friend was dead, and they afterwards ascertained that his decease had taken place on that night.

The magnetic illustration was related to the author by Mr W. W—, a gentleman well known in the north of England. This gentleman 'had been cured by mesmerism of a very distressing malady. During part of the process of cure, after the *rapport* had been well established, the operations were carried on whilst he was at Malvern and his magnetiser at Cheltenham, under which circumstances the existence of this extraordinary dependence was frequently exhibited in a manner that left no possibility of doubt. On one occasion, I remember, that Mr W. W— being in the magnetic sleep, he suddenly started from his seat, clasping his hands as if startled, and presently afterwards burst into a violent fit of laughter. As, on waking, he could give no account of these impulses, his family wrote to the magnetiser, to inquire if he had sought to excite any particular manifestations in his patient, as the sleep had been somewhat disturbed. The answer was, that no such intention had been entertained, but that the disturbance might possibly have arisen from one to which he had himself been subjected. "Whilst my mind was concentrated on you," said he, "I was suddenly so much startled by a violent knock at the door, that I actually jumped off my seat, clasping my hands with affright. I had a hearty laugh at my own folly, but am sorry if you were made uncomfortable by it."

The question will of course arise—What is this *rapport* or relation between the parties, and how is it established? Even admitting the facts, who can answer this question?

We are told, in ensuing chapters, of persons who had the power of entrancing themselves, in which state their spirits were free to roam abroad to any determinate place, and for determinate purposes. 'One of the most remarkable cases of this kind is that recorded by Jung Stilling, of a man who, about the year 1740, resided in the neighbourhood of Philadelphia, in the United States. His habits were retired, and he spoke little: he was grave, benevolent, and pious; and nothing was known against his character, except that he had the reputation of possessing some secrets that were not altogether lawful. Many extraordinary stories were told of him, and amongst the rest the following:—The wife of a ship captain, whose husband was on a voyage to Europe and Africa, and from whom she had been long without tidings, overwhelmed with anxiety for his safety, was induced to address herself to this person. Having listened to her story, he begged her to excuse him for a while, when he would bring her the intelligence she required. He then passed into an inner room, and she sat herself down to wait; but his absence continuing longer than she expected, she became impatient, thinking he had forgotten her; and so, softly approaching the door, she peeped through some aperture, and to her surprise, beheld him lying on a sofa, as motionless as if he were dead. She of course did not think it advisable to disturb him, but waited his return, when he told her that her husband had not been able to write to her for such and such reasons, but that he was then in a coffee-house in London, and would very shortly be home again. Accordingly he arrived; and as the lady learnt from him that the causes of his unusual silence had been precisely those alleged by the man, she felt extremely desirous of ascertaining the truth of the rest of the information; and in this she was gratified; for he no sooner set his eyes on the magician, than he said that he had seen him before, on a certain day, in a coffee-house in London; and that he had told him that his wife was extremely uneasy about him; and that he, the captain, had thereon mentioned how he had been prevented writing; adding, that he was on the eve of embarking for America. He had then lost sight of the stranger amongst the throng, and knew nothing more about him.

'I have no authority for this story,' says Mrs Crowe,

'but that of Jung Stilling; and if it stood alone, it might appear very incredible; but it is supported by so many parallel examples of information given by people in somnambulist states, that we are not entitled to reject it on the score of impossibility.'

This leads to the class of phenomena called in Scotland *wraiths*—that is, appearances of persons whose bodily they were not. This, says our author, sometimes occurs at the time of death, but often at an indefinite period before it, and sometimes where no such calamity is impending. 'In some of these cases, an earnest desire seems to be the cause of the phenomenon.' Maria Goffe of Rochester, dying at a distance from home, said she could not die happy till she had seen her children. 'By and by, she fell into a state of coma, which left them uncertain whether she was dead or alive. Her eyes were open and fixed, her jaw fallen, and there was no perceptible respiration. When she revived, she told her mother, who attended her, that she had been home and seen her children; which the other said was impossible, since she had been lying there in the bed the whole time. "Yes," replied the dying woman, "but I was there in my sleep." A widow woman, called Alexander, who had the care of these children, declared herself ready to take oath upon the sacrament, that during this period she had seen the form of Maria Goffe come out of the room, where the eldest child slept, and approach the bed where she herself lay with the younger beside her. The figure had stood there nearly a quarter of an hour, as far as she could judge; and she remarked that the eyes and the mouth moved, though she heard no sound.'

There is nothing remarkable in the following wraith anecdote; but it recommends itself, because of the parties being well known in Scotland. 'Mrs K——, the sister of Provost B—— of Aberdeen, was sitting one day with her husband, Dr K——, in the parlour of the manse, when she suddenly said, "Oh, there's my brother come; he has just passed the window!" and, followed by her husband, she hastened to the door to meet the visitor. He was, however, not there. "He is gone round to the back door," said she; and thither they went; but neither was he there, nor had the servants seen anything of him. Dr K—— said she must be mistaken; but she laughed at the idea: her brother had passed the window and looked in; he must have gone somewhere, and would doubtless be back directly. But he came not; and the intelligence shortly arrived from Aberdeen, that at that precise time, as nearly as they could compare circumstances, he had died quite suddenly at his own place of residence. I have heard this story from connexions of the family, and also from an eminent professor of Glasgow, who told me that he had once asked Dr K—— whether he believed in these appearances. "I cannot choose but believe," returned Dr K——; and then he accounted for his conviction by narrating the above particulars.

'I have met with three instances,' says Mrs Crowe, 'of persons who are so much the subjects of this phenomenon, that they see the wraith of most persons that die belonging to them, and frequently of those who are merely acquaintance. They see the person as if he were alive; and unless they know him positively to be elsewhere, they have no suspicion but that it is himself, in the flesh, that is before them, till the sudden disappearance of the figure brings the conviction.' We happen to know that one of these persons is an eminent man of science in Scotland. So familiar are his family with the circumstance, that one of them has been known to express apprehensions as to the early death of a distant friend, 'because — has seen him.'

One curious circumstance in many such narratives, is the irrelativeness of many of them to a useful or dignified object. 'Some few years ago, a Mrs H——, residing in Limerick, had a servant whom she much esteemed, called Nelly Hanlon. Nelly was a very steady person, who seldom asked for a holiday, and

consequently Mrs H—— was the less disposed to refuse her when she requested a day's leave of absence, for the purpose of attending a fair that was to take place a few miles off. The petition was therefore favourably heard; but when Mr H—— came home, and was informed of Nelly's proposed excursion, he said she could not be spared, as he had invited some people to dinner for that day, and he had nobody he could trust with the keys of the cellar except Nelly; adding, that it was not likely his business would allow him to get home time enough to bring up the wine himself.

'Unwilling, however, after giving her consent, to disappoint the girl, Mrs H—— said that she would herself undertake the cellar department on the day in question; so, when the wished-for morning arrived, Nelly departed in great spirits, having faithfully promised to return that night, if possible, or, at the latest, the following morning.

'The day passed as usual, and nothing was thought about Nelly till the time arrived for fetching up the wine, when Mrs H—— proceeded to the cellar stairs with the key, followed by a servant carrying a bottle-basket. She had, however, scarcely begun to descend, when she uttered a loud scream, and dropped down in a state of insensibility. She was carried up stairs and laid upon the bed, whilst, to the amazement of the other servants, the girl who had accompanied her said that they had seen Nelly Hanlon, dripping with water, standing at the bottom of the stairs. Mr H—— being sent for, or coming home at the moment, this story was repeated to him, whereupon he reproved the woman for her folly; and proper restoratives being applied, Mrs H—— at length began to revive. As she opened her eyes, she heaved a deep sigh, saying, "Oh, Nelly Hanlon!" and as soon as she was sufficiently recovered to speak, she corroborated what the girl had said—she had seen Nelly at the foot of the cellar stairs, dripping as if she had just come out of the water. Mr H—— used his utmost efforts to persuade his wife out of what he looked upon to be an illusion; but in vain. "Nelly, said he, "will come home by and by, and laugh at you;" whilst she, on the contrary, felt sure that Nelly was dead.

'The night came, and the morning came, but there was no Nelly. When two or three days had passed, inquiries were made; and it was ascertained that she had been seen at the fair, and had started to return home in the evening; but from that moment all traces of her were lost, till her body was ultimately found in the river. How she came by her death was never known.' Here, it will be observed, there is an element of triviality. To appear at a cellar door seems below the dignity of a spiritual existence. Yet, it may be said, what is it inconsistent with, but only our sense of taste—that sense under which we select incidents for fiction? We are not necessarily to expect that there is any such law presiding over these phenomena. On the theory, moreover, of an earnest desire being concerned in the case, it was natural for Nelly, at the moment of danger or death, to think of the duty which she would have been performing if she had not that day left her home.

Nearly akin to wraiths are what the Germans call *doppel-gangers* (double-goers), or self-seers—that is, appearances of a second self, sometimes seen by the individual as if it were a reflection of his own person, and sometimes only by others, either in his presence or at a distance. Catherine of Russia saw a figure of herself sitting on her throne, and ordered her guards to fire at it. Dr Kerner states the case of a Madame Dillenius, who was lying in bed when her sister saw her also walking about the room. No particular incident followed this event. 'Becker, professor of mathematics at Rostock, having fallen into an argument with some friends regarding a disputed point of theology, on going to his library to fetch a book which he wished to refer to, saw himself sitting at the table in the seat he usually occupied. He approached the figure, which appeared to be reading, and looking over its shoulder,

dow are as white as snow, and the staircase, an unusual thing in the damp atmosphere of this dirty quarter, is always dry and shining.

'The traveller who from curiosity visits this street—a true specimen of the times when the Jews of Frankfort, subjected to almost intolerable oppression—'

MEMOIR OF THE HOUSE OF ROTHSCHILD.

It is usual to trace the origin of great families to some gallant exploit, or some lucky accident, which suddenly raised the ancestor of the house from obscurity, and provided him at the same time with a legend to his coat of arms. The representatives of such families are born personages of history; their name, title, and estate—their position in the country—descending to them by inheritance, and so continuing from generation to generation, till war or revolution damages or removes the old landmarks of society. But there are other origins which it would be vain to endeavour to arrive at by a similar process: the origins of houses that rise steadily, not suddenly, in their peculiar career, and the success of which is not secured by a single incident, but distributed evenly over the lifetime of one or more generations. In such cases, the germ of prosperity must be sought for in the family mind—in the idiosyncrasy of the race—in the theory by which their conduct in the world is governed; and the first accident, which attracts the attention of the vulgar as the origin of their fortune, is merely a *point d'appui* selected by forethought and resolution. The rise of the house of ROTHSCHILD presents a very remarkable illustration of this view of a question which will never cease to be interesting, and affords a striking instance of the natural and simple means by which those vast results are obtained which it is customary to ascribe to chance or miracle.

In the middle of the last century there lived, in the town of Frankfort-on-the-Maine, a husband and wife of the Hebrew persuasion, who lavished all their cares upon a son, whom they destined for the profession of a schoolmaster. The boy, whose name was Meyer Anselm Rothschild, and who was born at Frankfort in the year 1743, exhibited such tokens of capacity, that his parents made every effort in their power to give him the advantage of a good education; and with this view he spent some years at Fürth, going through such a curriculum of study as appeared to be proper. The youth, however, had a natural bent towards the study of antiquities; and this led him more especially to the examination of ancient coins, in the knowledge of which he attained to considerable proficiency. Here was one step onwards in the world; for, in after years, his antiquarian researches proved the means of extending and ramifying his connections in society, as well as of opening out to him a source of immediate support. His parents, however, who were noted as pious and upright characters, died when he was yet a boy, in his eleventh year; and on his return to Frankfort, he set himself to learn practically the routine of the counting-house.

After this we find him in Hanover, in the employment of a wealthy banking-house, whose affairs he conducted for several years with care and fidelity; and then we see opening out under his auspices, in his native city, the germ of that mighty business which was destined to act so powerfully upon the governments of Europe. Before establishing his little banking-house, Meyer Anselm Rothschild prepared himself for the adventure by marrying; and his prudent choice, there is no doubt, contributed greatly to his eventual success in the world.

About this time a circumstance is said to have occurred, to which the rise of the Rothschilds from obscurity is ascribed by those who find it necessary to trace such brilliant effects to romantic and wonderful causes. The Prince of Hesse-Cassel, it seems, in flying from the approach of the republican armies, desired, as he passed through Frankfort, to get rid of a large amount in gold and jewels, in such a way as might leave him a chance of its recovery after the storm had passed by. With this view he sought out the humble money-

changer, who consented reluctantly to take charge of the treasure, burying it in a corner of his garden just at the moment when the republican troops entered the gates of the city. His *own* property he did not conceal, for this would have occasioned a search; and cheerfully sacrificing the less for the preservation of the greater, he reopened his office as soon as the town was quiet again, and recommenced his daily routine of calm and steady industry. But he knew too well the value of money to allow the gold to lie idle in his garden. He dug it forth from time to time as he could use it to advantage; and, in fine, made such handsome profits upon his capital, that on the duke's return in 1802, he offered to refund the whole, with five per cent. interest. This of course was not accepted. The money was left to fructify for twenty years longer, at the almost nominal interest of two per cent.; and the duke's influence was used, besides, with the allied sovereigns in 1814 to obtain business for 'the honest Jew' in the way of raising public loans.

The 'honest Jew,' unfortunately, died two years before this date, in 1812; but the whole story would appear to be either entirely a romance, or greatly exaggerated. Rothschild must have already been eminent as a banker, or he would hardly have been selected by the Prince of Hesse-Cassel as the depository of a sum amounting, it is said, to L.50,000, exclusively of the jewels. At anyrate, it was in the year 1801 he was appointed agent to the landgrave, afterwards Elector of Hesse; and in the next year (indicated in the story as that of the prince's return), a loan of ten millions was contracted with the Danish court through the House of Rothschild. Before this—and necessarily so no doubt—his knowledge, and the tried rectitude of his conduct, had gained him general confidence; his wealth had increased, and an enormous extension of the field of his operations had taken place. The fact appears to be, that by this time the banker of Frankfort was more in the habit of rendering assistance than of requiring it; and the Grand Duke of the day, to whom the Israelites owed their civic and political rights, nominated him a member of the electoral college, expressly as a reward for his generous services to his fellow-citizens.

The personal character of Meyer Anselm Rothschild is not of small consequence in the history of the house—for their dead father may be said to direct to this hour the operations of his children! In every important crisis he is called into their counsels; in every difficult question his judgment is invoked; and when the brothers meet in consultation, the paternal spirit seems to act as president. The explanation of this well-known and most remarkable trait in the family, is not difficult to those who are in the habit of penetrating through the veil of the romantic, in order to arrive at the simple realities of life. The elder Rothschild was obviously a man of comprehensive intellect, who did not act on the spur of chance or necessity, but after mature reflection, and on rules distinctly laid down; and he must have brought up his children in a certain theory, which survived his mortal part, and became identified with his memory. This is the only *idolum* conjured by the piety of his descendants. His bearing, we are told, was tranquil and unassuming; and although a devout man, according to his views of religion, his devotion was so completely untinged with bigotry, that in his charities he made no distinction between the Jew and the Christian.

In 1812, Rothschild left to the mighty fortunes, of which his wisdom had laid the foundation, ten children—five sons and five daughters; laying upon them, with his last breath, the injunction of an inviolable union. This is one of the grand principles to which the success of the family may be traced. The command was kept by the sons with religious fidelity. The copartnership in which they were left, remained uninterrupted; and from the moment of their father's death, every proposal of moment was submitted to their joint discussion, and carried out upon an agreed plan, each of the brothers

sharing equally in the results. The other great principle of their conduct is one which actuates all prudent men, and is only deserving of special remark in them, from the almost mechanical regularity with which it was acted upon—this was the determination never to run the slightest risk in pursuit of great profits. Their grand object was to see clearly each transaction to its termination, to secure themselves from all accidents that human forethought could avert, and to be satisfied with a reasonable and ordinary reward. The plan acted in a twofold manner. By husbanding their capital, they were enabled to take advantage of a thousand recurring commissions, so as to extend their connection day by day; while their habitual caution earned for them a reputation of solidity, which, united with their real wealth, carried their credit to a pitch which would have been dangerous, if not fatal, to less steady intellects. Credit, however, was no snare to them. They affected no master-strokes—no *coups d'état*. They would have used the lamp of Aladdin, not to summon genii, but to light their steps as they toiled on in the path of genii. The only secrets by which they obtained their choice of innumerable offers of business, were the moderation of their demands—the punctual fulfilment of their engagements—and the simplicity and clearness of their system. In short, the House of Rothschild became great, because its affairs were conducted upon the most perfect system of mercantile tactics, and because the character of its members, partaking largely of that of the original banker of Frankfort, combined many of those amiable qualities which secure popularity without forfeiting respect. They sought to make money by skill and industry, not parsimony; they gave a liberal share of their profits to all whose services were of use in attaining them; and their hand—

'Open as day to melting charity'—

doubled the value of the gift by the grace with which it was presented—the grace impressed upon the external manner by a simple and kindly heart.

We may now mention another circumstance which, on various occasions, must have contributed largely to the mercantile success of the family. Although their real union continued indissoluble, their places of residence were far asunder, each member of the house domiciling himself in a different country. At this moment, for instance, Anselm, born in 1773, resides at Frankfort; Solomon, born in 1774, chiefly at Vienna; Charles, born in 1778, at Naples; and James, born in 1792, at Paris. The fifth brother, Nathan, born in 1777, resided in London, and died at Frankfort in 1837. The house was thus ubiquitous. It was spread like a network over the nations; and it is no wonder that, with all other things considered, its operations upon the money market should at length have been felt tremblingly by every cabinet in Europe. Its wealth in the meantime enabled it to enjoy those advantages of separation without the difficulties of distance. Couriers travelled, and still travel, from brother to brother at the highest speed of the time; and these private envoys of commerce very frequently outstripped, and still outstrip, the public expresses of government.

We have no means of giving anything like the statistics of this remarkable business; but it is stated in the 'Conversations Lexicon,' that in the space of twelve years from 1813—the period, we may remark, when war had ruined all Europe, and when governments were only able to keep themselves afloat by flinging the financial burden upon posterity—between eleven and twelve hundred million florins (£110,000,000 to £120,000,000) were raised for the sovereigns of Europe through the agency of this house, partly as loans, and partly as subsidies. Of these, 500,000,000 florins were for England; 120,000,000 for Austria; 100,000,000 for Prussia; 200,000,000 for France; 120,000,000 for Naples; 60,000,000 for Russia; 10,000,000 for some of the German courts; and 30,000,000 for Brazil. And this, it is added, is exclusive 'of those sums for the

consequently Mrs H— was the less disposed to refuse her when she requested a day's leave of absence, for the purpose of attending a fair that was to take place a few miles off. The petition was therefore favourably received, but Mr H— came home, and was informed, to the total astonishment of which last circumstance, however, may already be considered an antiquated authority; for, in reality, the vast business of the firm can hardly be said to have commenced till after the dozen years referred to had expired. Since the year 1826, the House of Rothschild has been the general government bankers of Europe; and if it were possible to compare the two circles of transactions, the former would seem to dwindle into insignificance.

In 1815, the brothers were appointed counsellors of finance to the then Elector of Hesse; and in 1826, by the present Elector, privy counsellors of finance. In 1818, they were elected to the royal Prussian privy council of commerce. In Austria, they received, in 1815, the privilege of being hereditary landholders; and in 1822, were ennobled in the same country with the title of baron. The brother established in London was appointed imperial consul, and afterwards consul-general; and in the same year (1822), the same honour was conferred upon the brother resident in Paris. The latter, the Baron James, has the reputation of being the most able financier in France; and it is mainly through his assistance and influence with the other capitalists that railways are now intersecting the length and breadth of the land.

Nathan, the brother who resided in England, left four sons, three of whom rank among the most distinguished aristocracy of the British capital; the fourth, Nathan, residing in Paris. The eldest, Lionel de Rothschild, is privileged, as a British subject, to bear the title of an Austrian baron; his brothers being barons only by courtesy. The second has been recently created a baronet of England, as Sir Anthony de Rothschild; and the third, Baron Meyor, is now high sheriff of Buckinghamshire. Baron Lionel de Rothschild was invited by the Reform Association to stand as a candidate with Lord John Russell for the representation of London in the present parliament, and was returned third on the list. It will have been observed that a consultation was held by the Chancellor of the Exchequer with this hereditary financier, before ministers ventured upon their late celebrated letter, authorising the Bank of England to extend its issues.

Most of the members of this family have married, and live in great splendour here or on the continent; and it must be observed, as something characteristic of the race, that their choice of wives has usually been a good one. In London, where we know them best, the widow of Baron Nathan is held in great esteem for her inexhaustible charity, in the course of which, we observe by the newspapers, she has contributed largely towards the formation of an educational institution for children of the Christian faith. Her sister, the lady of Sir Moses Montefiore, is popularly known as a suitable helpmate for her philanthropic partner. The sister of Baron Nathan, widow of the brother of Sir Moses Montefiore, is likewise well known for her liberality, and more especially for the large funds she has bestowed on the establishment of schools for all religious denominations.

But there is another female of this remarkable family whom we must mention in a special manner, and with her name we conclude. She is the widow of the banker of Frankfort, the mother of the five brothers, and grandmother of those flourishing men who are now rising proudly among the aristocracy of Europe. The following notice of this venerable and venerated lady we take from 'Les Matinées du Samedi' of G. Ben Levi. 'In the Jews' street at Frankfort-on-the-Maine, in the midst of Gothic façades, black copings, and sombre alleys, there is a house of small exterior, distinguished from others by its luxurious neatness, which gives it an appearance of singular cheerfulness and freshness. The brass on the door is polished, the curtains on the win-

dow are as white as snow, and the staircase, an unusual thing in the damp atmosphere of this dirty quarter, is always dry and shining.

'The traveller who from curiosity visits this street—a true specimen of the times when the Jews of Frankfort, subjected to the most intolerable vexations, were restricted to this infected quarter—will be induced to stop before the neat and simple house, and perhaps ask, "Who is that venerable old lady seated in a large arm-chair behind the little shining squares of the window on the first storey?" This is the reply every citizen of Frankfort will make:—"In that house dwelt an Israelite merchant, named Meyer Anselm Rothschild. He there acquired a good name, a great fortune, and a numerous offspring; and when he died, the widow declared she would never quit, except for the tomb, the unpretending dwelling which had served as a cradle to that name, that fortune, and those children."

'Continued prosperity has attended the sons of the pious and modest widow. Their name is become European, their wealth proverbial. They inhabit sumptuous palaces in the most beautiful quarters of Paris, London, Vienna, Naples, and Frankfort; but their mother, persevering in her admirable modesty, has not quitted her comparatively humble house, where those sons come to visit her with respect and reverence, and discharge their duties in memory of their estimable father, thus presenting bright examples for the present time.'

A FEW PLEASANTRIES.

[Borrowed from 'The Family Jo Miller, a Drawing-Room Jest-Book.' This is a much improved form of a well-known kind of book, cleared of trash and indelicacy, enriched with new good things, and presented in elegant typography, and with capital characteristic embellishments. A life of Jo Miller at the beginning—the biography of a man of whom nothing is known—forms a tolerably successful, though good-natured burlesque of some of the recent lives of Shakespeare.]

The Modesty of Goldsmith.—Colonel O'Moore, of Cloghan Castle in Ireland, told me an amusing instance of the mingled vanity and simplicity of Goldsmith, which (though perhaps coloured a little, as anecdotes too often are) is characteristic at least of the opinion which his best friends entertained of Goldsmith. One afternoon, as Colonel O'Moore and Mr Burke were going to dine with Sir Joshua Reynolds, they observed Goldsmith (also on the way to Sir Joshua's) standing near a crowd of people, who were staring and shouting at some foreign women in the windows of one of the houses in Leicester Square. 'Observe Goldsmith,' said Mr Burke to O'Moore, 'and mark what passes between him and me by and by at Sir Joshua's.' They passed on, and arrived before Goldsmith, who came soon after, and Mr Burke affected to receive him very coolly. This seemed to vex poor Goldsmith, who begged Mr Burke would tell him how he had had the misfortune to offend him. Burke appeared very reluctant to speak, but after a good deal of preming, said 'that he was really ashamed to keep up an intimacy with one who could be guilty of such monstrous indiscretions as Goldsmith had just exhibited in the square.' Goldsmith, with great earnestness, protested he was unconscious of what was meant. 'Why,' said Burke, 'did you not exclaim, as you were looking up at those women, what stupid beasts the crowd must be for staring with such admiration at those painted Jezebels, while a man of your talents passed by unnoticed!' Goldsmith was horror-struck, and said, 'Surely, surely, my dear friend, I did not say so?' 'Nay,' replied Burke, 'if you had not said so, how should I have known it?' 'That's true,' answered Goldsmith with great humility: 'I am very sorry—it was very foolish. I do recollect that something of the kind passed through my mind, but I did not think I had uttered it.'—*Notes in Croker's edition of Boswell's Johnson.*

A Gentleman Groom.—'Why did you leave your last place?' said a gentleman to his groom, who presented himself for the service of his cab: 'did Captain R. discharge you?' 'No.' 'Was he a bad master?' 'On the contrary, a very good one—gave good wages, plenty of liveries, and as much help in the stable as one could want.' 'Then why leave his service?' 'To say the truth, sir, I found it very disagreeable in winter-time at Melton. Captain R. did not

belong to the right club, or live in the first set: and then he was so very dull in the tilbury, I really could not stand it.'—*Darham's Memoirs.*

An Ale Charm.—During the period when James I. studied the sciences at St Andrews, under the tuition of the celebrated George Buchanan, every sort of superior learning and knowledge was considered by the illiterate and superstitious vulgar as proceeding from magic, or, as it was usually termed, the black art. On this principle, George Buchanan, on account of his superior attainments in literature, was esteemed a wizard. A poor woman, who kept an alehouse in St Andrews, and who, by some means or other, had lost all her custom, applied to George for his witchcraft assistance. After some serious conversation, George told her that if she strictly adhered to his instructions, she would soon become very rich. To remove all his doubts, she gave him the strongest assurances of her punctual compliance with his orders. 'Then, Maggie,' said the learned wizard, 'the next time you brew, throw out of the vat six ladles full of water in the devil's name, turning between each ladle full round on the left; this done, put six ladles full of malt in the vat in God's name, turning round by the right between each time. And in addition to this, be sure to wear this bandage about your neck, and never open it till the day of your death.' Maggie strictly obeyed, and in the course of a few years, accumulated great riches. At her death, the bandage was opened in a solemn manner, when it was found to contain a label of paper, on which were written these words—

'Gin Maggie brew good ale,
She will get good sale.'

UNDERWRITING.

To render the process of underwriting as intelligible as possible, we may suppose a case, for the purpose of illustration:—Suppose a vessel of the class A 1, registered for seven or ten years, be valued at L.20,000 or L.30,000, a policy is effected upon her, and the owners or their brokers go among their friends at Lloyd's, and see at what rate she can be insured. If the voyage be a distant one, or the season of the year be considered dangerous, the rate will most materially vary. Thus, at one time, a premium of L.1, 1s. or L.2, 2s. per cent. might be taken, and at another time the underwriter would perhaps not be inclined to do business under L.3, 3s. or L.4, 4s. per cent., it not only depending on the class of the ship, but the cargo she is likely to carry, and the port for which she is bound. These are all considerations which the underwriter most carefully weighs in his mind before he takes a part or risk in an adventure of the sort. On a vessel of L.20,000 or L.30,000 value, the policy of insurance might be divided among as many as a dozen underwriters, including some at Liverpool and Glasgow. And it very often happens that the Liverpool and Glasgow people will insure their ships at London, and *vice versa*. This will account for the statement occasionally to be seen in the papers, that 'notwithstanding the vessel was a London trader, the greater part of the loss will fall upon the underwriters of Liverpool and Glasgow.' When a vessel continues absent after the expected date of arrival, and no news has been received of her, the premium of insurance will advance considerably, and then the business resolves itself into a mere speculative transaction. Some of the members of the room snap at this business, but it does not often prove profitable. The ill-fated President was 'done' at a very high premium in the room, and, up to the latest moment of hope, persons were found willing enough 'to take a few thousands of her at a long price.' When bad weather has occurred, either on the coast or abroad, the underwriters at Lloyd's make the most anxious investigation of the books and the lists received, to trace, by every possible means, the result of their risks. The remark of 'a good book' or 'a bad book' among the subscribers is a sure index to the prospects of the day, the one being indicative of premium to be received, the other of losses to be paid. The life of the underwriter, like the stock speculator, is one of vast anxiety, the events of the day often raising his expectations to the highest, or depressing them to the lowest pitch; and years are often spent in the hoped-for acquisition of that which he never obtains. Among the old stagers of the room, there is strong antipathy expressed against the insurance of certain ships; but we never recollect it being followed out to such an extent as in the case of one vessel. She was a steady

trader, named after one of the most venerable members of the room; and it was a most curious coincidence, that he invariably refused to 'write her' for 'a single line.' Often he was joked upon the subject, and pressed 'to do a little' on his namesake; but he has frequently declined, shaking his head in a doubtful manner. One morning the subscribers were reading the 'double lines,' or the losses, and among them was the identical ship, which had gone to pieces, and become a total wreck.—*The City.*

THE OUTSIDE PASSENGER.

Some years ago, a young lady, who was going into a northern county, took a seat in the stage-coach. For many miles she rode alone; but there was enough to amuse her in the scenery through which she passed, and in the pleasing anticipations that occupied her mind: she had been engaged as governess for the grandchildren of an earl, and was now travelling to his seat. At mid-day the coach stopped at an inn, at which dinner was provided, and she alighted and sat down at the table. An elderly man followed, and sat down also. The young lady rose, rang the bell, and addressing the waiter, said, 'Here is an outside passenger: I cannot dine with an outside passenger.' The stranger bowed, saying, 'I beg your pardon, madam, I can go into another room,' and immediately retired. The coach soon afterwards resumed its course, and the passengers their places. At length the coach stopped at the gate leading to the castle to which the young lady was going; but there was not such prompt attention as she expected. All eyes seemed directed to the outside passenger, who was preparing to dismount. She beckoned, and was answered, 'As soon as we have attended to his lordship, we will come to you.' A few words of explanation ensued, and, to her dismay, she found that the outside passenger, with whom she had thought it beneath her to dine, was not only a nobleman, but that very nobleman in whose family she hoped to be an inmate. What could she do? How could she bear the interview? She felt really ill, and the apology she sent for her non-appearing that evening was more than pretence. The venerable peer was a considerate man, and one who knew the way in which the Scripture often speaks of the going down of the sun. 'We must not allow the night to pass thus,' said he to the countess; 'you must send for her, and we must talk to her before bedtime.' He reasoned with the foolish girl respecting her conduct, insisted on the impropriety of the state of mind that it evinced, assured her that nothing could induce him to allow his grandchildren to be taught such notions, refused to accept any apology that did not go the length of acknowledging that the thought was wrong, and, when the right impression appeared to be produced, gave her his hand.—*Newspaper paragraph.*

A HINT TO AMUSEMENT DENOUNCERS.

There are people who would say, 'Labour is not all; we do not object to the cessation of labour—a mere provision for bodily ends; but we fear the lightness and vanity of what you call recreation.' Do these people take heed of the swiftness of thought—of the impatience of thought? What will the great mass of men be thinking of, if they are taught to shun amusements and the thoughts of amusement? If any sensuality is left open to them, they will think of that; if not sensuality, then avarice or ferocity for 'the cause of God,' as they would call it. People who have had nothing else to amuse them, have been very apt to indulge themselves in the excitement of persecuting their fellow-creatures. Our nation, the northern part of it especially, is given to believe in the sovereign efficacy of dulness. To be sure, dulness and solid vice are apt to go hand in hand; but then, according to our notions, dulness is in itself so good a thing—almost a religion. Now, if ever a people require to be amused, it is we sad-hearted Anglo-Saxons. Heavy eaters, hard thinkers, often given up to a peculiar melancholy of our own, with a climate that for months together would frown away mirth if it could—many of us with very gloomy thoughts about our hereafter—if ever there were a people who should avoid increasing their dulness by all work and no play, we are that people. 'They took their pleasures sadly,' says Froissart, 'after their fashion.' We need not ask of what nation Froissart was speaking.—*Friends in Council.*

CHEAP ENTERTAINMENT.

No entertainment is so cheap as reading, nor any pleasure so lasting.—*Lady M. W. Montagu.*

BALLADS OF THE RHINE.

BY ANDREW B. PICKEN.

DUSSELDORF.

'Vergin mein nicht.'

Out on the waves, far out, my sea-bird! thou and I
Will rock ourselves in dreams of faithful Germany.
I framed thee of the sandal-tree, my alight and silvery boat,
That thou might'st shine amid the green, like lily-leaves afloat.
I spread a sail of finest woof, scarce fit to hold the breeze,
That thou might'st be, my lone canoe, the darling of the seas!
There are no lookers on, my friend, but the free clouds of the sky—
So out upon the far blue waves, my sea-bird! thou and I!

Come, all ye fair and yellow-locked, ye children of the Goth,
Ye restless and disdained of sleep, yet more abhorred of sloth;
Come with your iron sinews, and your broad and dauntless brows,
Like argosies that quell the waves 'neath their imperial prow;
Down the good old German highway, whence our hosts went forth
to Rome,
Come with your harvest burden, and be welcome where ye come.

At Dusseldorf is many a *Hau'*, where the golden bush hangs out—
But ye, the wine-pressers, know well the wily bait to scout;
The 'good wine needs no bush,' as your old 'mortaires' wont to say;
'Let the juicy monks smack first, I trow the nuns wont turn away.'
Oh merry market crowds, as in a picture, still I see
Your looks like mellow waving corn, smiles dipping like the sea.

Old Father Teniers fondly loved your summer greenerie,
The low and dozing homestead, and the bourging threshold tree;
With the labyrinth of roses, and the dark and dreamy well,
And the *jodin* of the vineyard, and the merry curfew bell,
And the babes a-sporting round his knee—oh! Bawlers of Oberland,
The old man was a child again amid your mountain band.

And Luther, the uncanonised, the blessed then as now,
That pored upon the Holy Writ with a sunbeam on his brow;
For you he wrenched the tare up, and made clear the truthful
wells,

'Mid the crashing of the graven things, and the howling of the cello
The echo of his fearless voice still haunts your crowned hills,
And the blessings of his gentle heart around ye play like rills.

There's a music in your homely speech, a music of the heart,
That keepeth green the memory of golden-lyred Mozart;
Whether, like falling water, 'mid the brown vine leaves it sings,
Or floats 'neath the cathedral arch on soft angelic wings!
The holiest of your household gods, while hoary Hartz shall stand,
The 'rare old minesinger' shall abide within the land.

The sword is now a ploughshare, but the storied Rhine can tell
When the serried Schwartz-reiters came down, the work went brave
and well.

When the lances of Bavaria flashed, like lightning from the cloud,
And Almaine from her outraged heart pronounced her curse aloud,
Where then stood ye, oh stalwart and broad-breasted men of
Rhine?

In the first dread line of battle with the boldest of the line.

THE PIETY THE WORLD HATES.

It is not true that the world hates piety. The modest and unobtrusive piety which fills the heart with all human charities, and makes a man gentle to others and severe to himself, is an object of universal love and veneration. But mankind hate the lust of power, when it is veiled under the garb of piety; they hate canting and hypocrisy; they hate advertisers and quacks in piety; they do not choose to be insulted; they love to tear folly and impudence from the altar, which should only be a sanctuary for the wretched and the good.—*Sidney Smith.*

ZEAL OF PARTY.

Doctor, afterwards Dean Maxwell, sitting in company with Dr Johnson, they, talking of the violence of parties, and to what unwarrantable length party men will sometimes run, 'Why, yes, sir,' says Johnson, 'they'll do anything, no matter how odd or desperate, to gain their point; they'll catch hold of the red-hot end of a poker sooner than not get possession of it.'

PRINCIPLE AND CIRCUMSTANCES.

It is the distinguishing characteristic of man to appreciate moral truth, and to follow its dictates from an inward principle, which is not a mere casual impulse, or current opinion of the day, but the calm deduction of the highest reason, harmonising with the declared will of God, and acting through the medium of an enlightened conscience.

A high authority teaches us to combat circumstances, and promises high rewards to those who 'overcome.' It urges us to be pure amongst the impure—not to go out of the world, but to overcome the evil which is in it. Thus we are taught that 'life is a warfare, in which we must side with the good or evil; and just in proportion as we show indecision, we shall invariably suffer as moral beings.' This opposing of 'circumstances' by force of an inward principle, is the great moral warfare in which all good and true men have to bear a part, and the weapons of their warfare are not carnal, but spiritual; that is, they consist of 'principles.' What numerous things there are in every-day life which might yield a momentary gratification, but from the commission of which a man of principle is continually deterred! He might take some step which would make him suddenly rich, but he is deterred from doing so if it should cause injury or suffering to his fellow-creatures; he might invade the liberties and enjoyments of his fellow-men with impunity; in fact there is no limit to the mischief which every man might commit, if not under the restraint we have indicated. Virtuous conduct, therefore, is but the amount of resistance to circumstances, and the amount of sacrifice we may have submitted to for the sake of principle. We know, from experience, that there is no eminence of any kind without effort, resistance, discipline; and the excellence of the attainment is generally in proportion to the severity of the discipline. Exercise and effort tend to improve all our faculties, mental and moral, as well as physical. Providence seems to have interposed the obstacles of 'circumstances,' in order to strengthen character, and to develop virtue. Virtuous conduct, therefore, is not a mere conventionality or convenience of action. That is not virtue which is never tested by trial and temptation. Virtuous conduct cometh out of the furnace, and shines with increasing lustre. Everything that is lovely in character, every act of moral bravery and virtue, derives its lustre from this battling with circumstances, and overcoming them. The virtuous conduct which is the mere result of circumstances, is not virtue at all. It may wear its garb; it may receive even the homage of the world; but, as we understand virtue, this is not it. The opposite view of the subject, which would give to circumstances a greater influence over the virtues of men than principle, would

deadens all our faculties. We should be always calling on Jupiter for help, instead of putting our shoulder to the wheel, and vigorously trying what strength we have in ourselves. If circumstance is to mould us, and to limit our virtues, we have nothing to hope for, no moral or spiritual good to aspire after. We may, in that case, lie down in despair.

'Circumstance' is anything or nothing, according to the weakness or strength of character and principle to resist. It exists, at the best, only in some *tangible* shape, some physical obstruction, some caprice of fortune, or some bugbear of the mind. Virtue, conscience, duty!—the power of moral appreciation exists independently of all these. Though the whole world in arms is against the man of principle, he remains unmoved, self-controlled, and self-rewarded. You may imprison his body, or take away his life, but you cannot deprive him of his principles. When the body dies, he believes that these principles of truth and duty will still survive. If not, why this feeling after immortality? why this discrepancy between what we are, and what we would aspire to be? If circumstances make virtue, what becomes of virtue when circumstances vanish away? All sublunary things are merely 'circumstances,' and will one day vanish to us all; but virtue, and the rewards of virtuous conduct, emanating from a spirit and principle within, will still survive. As 'men's outward fortunes do draw the inward quality after them,' so it is natural to believe that, in a future state, this 'inward quality' will still 'draw after it' the superior blessings of immortality.

Even in the outward circumstances of life, why do we choose certain individuals for places of trust and responsibility, but because we think their principles are proof against the temptations of circumstances. It is the same with public men—the self-denying spirit which makes the patriot and martyr to principle, and to duty, this is their only passport to confidence and true fame, as it is the only passport to our confidence on behalf of the poorest man we may employ. The same applies to all moral reformers, and to every individual man: you will find that the virtue is the amount of resistance which they have shown to circumstance. We teach this lesson to our children, as the only solid basis of all moral training: 'when wicked men entice thee, consent thou not;' when allured by the blandishments of transitory pleasure, look forward to futurity; when the days are dark, and the storms of trouble are threatening to overwhelm thee, still hold on to principle—be above 'circumstances!'

Even in temporal affairs, the advantages of being self-sustained by a fixed principle are most apparent. Men go into the wildernesses of the world surrounded with the most adverse circumstances; but the true man never despairs, so long as he has confidence in his prin-

ciples and in himself. He proceeds to do battle with them all: he fells the forests, he ploughs the fields, he sows his seeds, and in due time he reaps his reward.

This subject might be illustrated by the experience of every-day life. How notorious is the fact, that those children who have had the most done for them by circumstances, frequently turn out the least serviceable members of society! Pamper your offspring by circumstances, protect them and smother them with kindness, and you cannot take a more direct means of enfeebling their characters, and of robbing them of all genuine principle. On the other hand, who have always been the really influential and strong men of the day? Who are the men who have 'learned to endure hardness,' who can buffet most successfully against the frowns of fortune? Are they not generally those who are self-formed, who have done everything for themselves, who have had nothing to trust to but their own inward energies?

The same principle holds good in science, in literature, and in artistic eminence. It is not chartered universities, nor royal societies, nor the patronage of the great, which have produced the most splendid results. No: the fostering of circumstances *alone* never produced genius, nor virtue, nor eminence of any kind, and never will. It never produced a Watt or an Arkwright, a Stephenson or a Dalton. It never produced a poet like him

'Who walked in glory and in joy,
Following his plough upon the mountain side.'

The same may be said of religion, or rather of the fostering and patronising influence of religious professions.

If circumstances without effort produced virtue, then those countries should be the most virtuous which are the most favourably situated as to natural advantages. The orange-groves and vineyards of Spain and Italy, one would think, should be abodes of virtue and of patriotism, if easy circumstances, and the absence of obstacles, could produce it. But what is the fact? As Goldsmith says, 'Whilst—

In florid beauty groves and fields appear,
Man is the only growth that dwindles here.'

The high rewards of virtue, it would appear, are not offered to the merely acquiescent and passive spectator of the scene. The most amiable dispositions even degenerate when not called into active exertion. 'The strength to suffer, and the will to serve,' are not acquired by sitting down contentedly with things as we find them. It is not by living a butterfly or caterpillar existence, and merely taking the colour of surrounding circumstances, that eminence or virtue of any kind can be attained.

But besides all this, the advocates of the supremacy of 'circumstances' destroy every vestige of human responsibility! You must then passively submit to a worse than Asiatic apathy or Turkish fatalism. Duty is no more! You have merely to consult your convenience, your pride, your covetousness, or your lust; and these will find ready instruments of gratification in the circumstances around you. Every fiend that could minister to the evil passions of man would then be let loose, and the world would become one great pandemonium of villany and corruption. 'Man, so noble in reason, so infinite in faculties, in action so like an angel, and in apprehension so like a god,' is then, after all, the mere sport of circumstances! Why, this is the most degrading and injurious view of human nature you could possibly take. For what are these high faculties, these godlike instincts given to us, but that we may vindicate the supremacy of our moral being, and make the world and ourselves better by a continual warfare with circumstances. The man of principle has a talisman in his own breast which makes circumstance his slave. In mere worldly affairs, by the force of principle, we may, as Shakespeare says, 'pluck out of the

nettle danger, the flower safety.' 'We may extract a soul of good out of things' apparently 'evil.'

We would freely admit the enormous power of circumstances in moulding men's *manners*, and in reconciling them to the customs around them. No person who has observed the monotony, the sameness, and the commonplace character of the mass of mankind, but must be struck with the enormous influence of circumstances in producing these results. Even men's opinions may appear to be the result of circumstances; but these are merely the floating hearsay opinions of the day, and are of no use to their possessors, or to the world. It is 'because the world is too much with us, because we have given our hearts away,' that we are so miserably dependent on external opinions and circumstances. When we ascend to the regions of moral truth, to principles, we are altogether in a higher sphere—we no longer passively submit to be thought *for*, and moulded *by* others: we begin to think for ourselves; to appropriate principles as our own; and as individuals, and though alone, can confidently fall back upon them in the day of need. A man like this is self-guided, and he becomes strong; and prevails so long as the motto of his shield is to 'bide-by the right.' There is no *right* and no *wrong* in human conduct, if you are the sport of 'circumstances;' no satisfactions of conscience for having stood by the right, no moral or spiritual progress for man, if he once embraces this degrading creed. No man can then be trusted in the common affairs of life: you give up the great principle of integrity between man and man: honour, faith, truth, and adherence to them, regardless of consequences, are then no more: you are then to wander forth into an unknown wilderness without a guide, and to sail on a trackless ocean without a compass, a rudder, or a chart, and with no haven of rest in prospect before you.

In these unbelieving times, it is difficult to make people perceive the mighty efforts which may spring from simple adherence to principle, even by a single individual. The world seems not to believe it, until some *one man* puts them all to the blush by adhering *to*, and suffering *for*, his principles. It is melancholy, in looking over the dreary waste of history, to find so few individuals, out of the vast mass, who have acted from principle such as we have attempted to describe. This may be truly described as 'the great tragedy of the world.' Still *there are a few*, and these few comprise the moral history and progress of mankind. By these the waverer is confirmed and called back to duty—the apathetic, and morally dead, are resuscitated to life and activity. It was one act of 'moral principle,' one act of resistance to circumstances, which made Joseph the saviour of his adopted country, and the deliverer of his people. There are a few kindred names in our modern history, and they are the turning-points of freedom, of reformation, and of religion. When the world stood aghast with fear, and was ready to give up the cause, these men of principle stepped into the breach, and turned the battle to the gate. Luther was made of materials like this; so were Ridley and Latimer, and a host of the early martyrs. By adhering to principle, Pym, and Hampden, and Cromwell wrested the sceptre from one of the proudest monarchies of the world, and saved their country from despotism; by adhering to principle, Greek and Roman sages, and patriots, and philosophers, have covered all future ages with traces of their classic glory. Even the deities in their pantheons are representatives of moral heroism, symbolising often in the rudest forms the triumphs of circumstance-defying principle. By principle, Washington saved his country from a foreign yoke, and founded that vast republic which is now the ark of refuge for the miseries and destitution of the world; by principle, Tell kindled in the mountains and valleys of Switzerland a love of freedom which will never die; by principle, more than by her armies and navies, our own beloved country remains to this

day the arbiter of Europe, and amidst all her troubles and perplexities, still possesses the undiminished confidence of the world. It is by the high principle of individuals, exhibited under trying circumstances, that any nation ever became truly great; and it is by the want of it that so many have decayed away. In the language of Scripture, 'the time would fail to tell' of those deathless names who, through faith in principle, and in opposition to circumstances, 'have wrought righteousness, and waxed valiant in fight' in the moral warfare of the world. The time would fail also to tell of those still more interesting triumphs of principle which are every day exhibited in the quiet recesses of private life—the integrity of dependents, the mutual assistance of the poor, the kindness shown to the aged and infirm, the tenderness which hovers over the couch of sickness, and which seeks out the prisoner in his cell, the beneficence of neighbours, and the faithfulness of friends—these, bad as the world is, are sufficient to cast a halo of moral greatness over the destinies of man, which *circumstances* can neither give nor take away.

THE WEST INDIA VOYAGER.

Atlantic Ocean, Nov. 7, 18—. After three days' grave deliberation, I have resolved to keep a brief journal of a part of our voyage. The formation of this resolution was on this wise. On Thursday morning, my fellow-voyager loudly declaimed against some of our passengers for speaking of that day as sacred to the memory of Guy Faux—a gross error (as he deemed it) in chronology. Now, Guy Faux's day it was, and it appeared to me plain that, unless we kept our reckoning better, we should lose a couple of days at least before reaching Jamaica. So I keep a journal to save time, and to spend it.

More than this, sea thoughts and sea sensations are to a landsman so various, that unless you describe them as they come, you lose them. No great loss perhaps; and yet there are some I have been conscious of during the last few days, the recollection of which I much wish, if only for the sake of contrast, to retain. Hence this my chronicle.

If I were an old Roman, and marked favourite days in my pocket-book with white chalk, Tuesday, Wednesday, and, I must add, Thursday of this week, would be marked with B. B. crayons, if such there are; if not, with coal black. Three mortal days, to say nothing of nights, we rolled, and creaked, and pitched, struggling with wind and waves without and within—but the tragedy is too recent to become the subject of dramatic description. The simple fact is, we had all the time a 'nasty cross sea,' with a head wind and a rolling vessel, and we adapted ourselves to our circumstances.

Two things in those three days are note-worthy. We discussed, with illustrations, the question, What is the disease of sea sickness—is it physical or mental? I thought it an affection of the brain, and argued pathetically enough—an idea confirmed by an ancient theory—that a man's thinking faculty is in his stomach. Beyond the weight of this coincidence, however, I am not inclined to attach much importance to this explanation.

The other note-worthy event remains. I had proof of the incorrectness of Bonaparte's celebrated dictum—'that there is but one step between the sublime and the ridiculous'; a dictum which, I am aware, that some speeches of his illustrate. Here the sublime was on deck, in the raging sea and roaring wind; and the ridiculous below, in the countenances and groans of our passengers. Between them, we found not one step, but thirty! The great sayings of the greatest men are evidently not meant to be pushed too far.

Having started on Monday, on Thursday evening we rallied a little; on Friday, breakfasted on beefsteaks at one o'clock; and to-day we have had three regular meals—in the cabin—among a hundred and twenty fellow-travellers, and without a qualm. The weather is

already balmy and summer-like; the sea, an invisible green, nearly black; the wind fair; the company agreeable; and Madeira within *three days' sail*. Yes, three days' sail, for our progress is slow, and it will take eight days from Southampton to reach Madeira. 'But never mind,' says our steward; 'she took twelve days last voyage.' 'Rolling, sir?' 'Why, pretty well, but nothing to what I have known. The fact is, our steamer had last voyage a gale the whole way.'

Was ever seen such a ship's company? Our crew are in all about eighty persons. Our passengers 120—Germans, Spaniards, Frenchmen, omnipresent Scotchmen and English, besides Americans and West Indians. You will remember among our passengers the Dutch family. Their fore-elders certainly sat to Teniers: grandmother, mother, children, father, and all. There is also a laughing Spanish face (with body to match of course) whom Murillo might have painted. I speak of her with less confidence, however. Spanish archness is so imitable, and so likely to be imitated, that one can never be sure that it is genuine. The Dutch face and the Dutch figure are both safe from counterfeits. No one can copy them if they will, and nobody will copy them if they can. Might not this hint be sold to Messrs Freshfield? Only make bank-notes like Dutch young ladies, and who would forge them? The Dutch children come upon deck every day: they find few friends, however. Their faces are pleasing, and when lighted up with a smile, are even pretty; but their dress is sadly against them. One little fellow was before me to-day, with a large slit from his neck to his legs—in front and behind too. I did not dare to touch him, though strongly disposed. I should have expected to have seen him drop out of his covering, and so leave us both in an awkward plight: I with his clothes, *minus* the boy; and near me the boy, *minus* the clothes. On second thoughts, and after further examination, I fancy this dress is adopted for economy's sake. The little fellow has his trousers on, but no coat; or rather he wears as coat a wrapping of tropical air, a material confessedly light and inexpensive. Tell this hint to any six-boiled mothers you know. It may be worth something.

I wish I could give you an idea of one of our dinners: only one indeed have I attended; but before familiarity breeds contempt, I will chronicle it, though but briefly. Fancy, then, one hundred and twenty passengers, of all hues, shapes, beards, and head-dresses, airing themselves, and seeking appetites, and shunning nausea from ten o'clock till three. At four they rush below, take their seats to the sound of trumpet, and fill the cabin. First comes soup, then fish, then roast, boiled, grilled-fried flesh, fowl, and game of all sorts, some richly odorous, all obviously welcome. You look at your watch: it is five o'clock; for this is the business of the day. Then comes pastry; then cheese and celery; then dessert, and such wine as you please to order. By this time it is past six, and the dinner is done. Done? No—hardly: it is followed by cigars and walks on deck till eight o'clock, when eight bells ring, and summon us to tea. Our morning meal is at nine, and is equally hearty—chops, steaks, eggs, and fowl, with tea and coffee. The whole one hundred and twenty at once: for all defaulters show themselves now, and seem proud of their strength.

It is impossible to conceive a better half-way house to the tropics than Madeira. We arrived here early this morning, and have most of us been on shore for a few hours, admiring flowers, and fruits, and hanging-gardens on all sides—everything, in fact, of nature's workmanship, though but little of man's. Our vessel was surrounded, as soon as we dropped anchor, by Portuguese traders, who offered flowers, baskets, oranges, and tropical fruits in rich abundance. The noise and gestures of the salesmen would have bespoken in Ireland bloodshed at least; here they bespeak only the activity of the commercial spirit. After a ramble through the streets of the town—the thermometer at 75

degrees in the shade, and during the early morning—we mounted our horses, and ascended the steeps on which the town stands. The gardens abound with orange-trees, savannas, figs, and vines, and are often bordered with hedges of bamboo. The geranium and heliotrope, and double-white jasmine and the rose-tree (literally a tree), are still in full bloom, and hung over the roads and streets in luxuriant festoons. In our peregrinations we visited the cathedral, a gaudily-ornamented building. We afterwards went to the nunnery, where we were tempted to buy artificial flowers curiously beautiful, being made entirely of feathers. The sisters also showed us a collection of preserved fruits—pumpkins, figs, lemons, &c. Some of us yielded to the temptation, and brought off a pound of each, intending to bring part to England. C—fears our report will be—'It would not keep.'

We sail this afternoon for Barbadoes.

Nov. 14.—A sea voyage is, after all, a monotonous business. Our one hundred and twelve passengers—for we left eight at Madeira—breakfast, lunch, dine, and take tea as usual. The only novelties are dancing in the evening on deck, and most determined card-playing below. Our weather is glorious, very much like an English summer, and as yet not warmer. We must not boast, however, for we are still some distance from the tropical line: we expect to pass it to-morrow. The chief peculiarities in external objects are the sky and stars, the flying fish, and the phosphorescent appearances on the water. The stars shine out in much stronger relief than in England: at home they are too like candle ends, set in wet blankets; here they seem literally 'eye-holes to let glory through.' The position of the constellations, too, is entirely changed: earth there is none: but we are often tempted to believe that we are under a 'new heavens.' The flying fish have shown themselves repeatedly during the last few days: they are of the size of a herring, and fly along the surface of the water for a very considerable distance. Dolphins and sharks we have no hope of seeing: the noise of our paddles frightens them away.

Nov. 16.—Contrary to the usual practice on board steamers, we are to have a visit to-morrow from Neptune. He came on deck to-night, and announced to the captain his intention to visit us to-morrow. I saw Neptune—I ought to have said his messenger. He brought recent newspapers and despatches from his sea majesty—the despatches signed 'Neptune,' and witnessed by 'Amphitrite x her mark.' I must send an account to one of the youngsters.

We have been sadly baffled by the trade winds. They wafted us along for a day or two, and then left us. Their place is now supplied by a head wind. The only serious effect, however, is, that we shall have at Barbadoes but six hours instead of twenty-four. 'Never mind,' says our Admiralty agent, 'it's a filthy, broiling place.' Decisive indeed!

Carlisle Bay, Barbadoes, Nov. 24.—There are few things more amusing to one who visits the tropics for the first time than the heat—amusing, for heat is really a friend to good temper; more so, at all events, than cold. You wake in the morning before sunrise. You begin to wash, and by the time you have dried your face and hands, they need drying again! You put on your stockings, and though they be (as they ought to be) quite clean, you are obliged to have recourse to the towel again, or fall back on your pillow exhausted—and so on, till, at the end of an hour, your toil and toilet are ended. Then the heat of walking on deck begins. You sit under the awning, stretch out your neck to catch the breeze, and absolutely perspire with the effort. Your walking done, such as it is, you descend to breakfast—chops, rice, beefsteaks, eggs, tea. All eat and perspire, and perspire and eat again: the only interruption, 'Oblige me with that chop! 'How warm it is!' and such-like interesting communications. The walking on deck is resumed; and all is done to remind you that it is not winter. The sailors

are at their work, clothed in at most three garments, including a hat, and all scanty. The Dutch children—who turn out to be little Spaniards—have but one garment to cover them, Fernandian fashion. Our captain and many of our passengers are all in white, from head to heel (their very boots are white); and ladies and gentlemen all huddle together on the shady side of the deck, creating artificial gales enough to waft the ship out of her course did they all blow in one direction, instead of blowing in the fair faces (so called by courtesy) of the sufferers. On shore, the sailors' garments are not quite so complete; the children's dress is somewhat shorter; and ladies and gentlemen—not indeed of the highest class—dress (as to their arms, necks, and legs) in white or black, according to the countries where their parents were born. The heat of the tropics is really amusing!

We have to-day spent our first day on shore in the tropics—a very agreeable one indeed. Last night we saw land the first time for nearly a fortnight, and at eight o'clock dropt our anchor in Carlisle Bay, off Bridgetown, the capital of Barbadoes. How joyous is the sound of the chain-cable rattling out of the port-hole, as the anchor is seeking the bottom! It is really poetical, conveying to the mind, and to the heart too, the same ideas as 'home.' After breakfast this morning, some friends came on board for us, and invited us to their house. On reaching the shore, we all went to bathe, and after a quarter of an hour's drive, we found a bathing-house, built on piles in the sea, and protected from the sharks by a long coral reef, about a quarter of a mile from the land. Here we had a kind of tepid bath, which we greatly enjoyed. We afterwards dined on turkey, mutton, yams, sweet potato and rice, and sorrel puddings. . . . I ought to have said that before bathing we went to the market, and ate a couple of most delicious oranges and a piece of sugar-cane. After bathing, we had a short drive into the country among 'Barbadoes' pride,' tulip-trees, cocoa-nut-trees, plantains, papaws, negro huts, guinea-grass, sugar-cane, and naked black children, the whole very becoming and picturesque. The children here are real ornaments to the landscape, with their white teeth and occasional white shirts, their strong limbs and laughing faces. They are more precocious than with us; often walking at nine months, and looking quite observant and judicial at fifteen. The children painted by Spanish and Italian painters are quite natural, though so sedate and thoughtful. The laughing Saxon face contradicts this statement, but not so the southern and Indian.

The island of Barbadoes is for all the world like the Isle of Wight, and of the same size; most richly cultivated, but appearing somewhat bare and flat. It was a natural and pleasant fancy, as we neared the island, to imagine that we were sailing towards Cowes, having passed the Needles a couple of hours before. The cocoa-nut-trees and plantains, and the aforesaid amusing heat, soon dissipated this delusion, and said plainly enough—'Cowes! 'tis four thousand miles away!'

Bridgetown stretches along the sea-side, in a beautiful bay, for about two miles, and contains a population of some twenty thousand.

The blacks who own the boats that took us on shore are a sad set, but good-tempered and amusing. The first sound I heard from them in the morning was 'Poor Lucy Neal!' whistled in quite touching style. One fellow had called his boat 'John Weslen,' meaning John the Wesleyan; and cried out, 'John Weslen waits for you, ladies and gentlemen!' Another had called his 'The Friends,' and his cry was, 'The Friends, at your service: have the honour to take you on shore, sir?' The whole band showing their teeth and looking inordinately waggish. 'What's your charge?' 'A dollar a-piece, sir—it being notorious that a shilling had been the price all the morning—'No, no; we'll give a shilling for each of us.' 'Yes, sar, that will do.' Then sotto-voce, 'Make way there; the gentlemen are coming.'

Port of Spain, Nov. 28.—After a few hours' stay at

Grenada—one of the most beautiful harbours one can imagine—and a pleasant night sail, we reached Port of Spain about eleven o'clock on Thursday morning. The passage through the Bocas (between the Spanish main and Trinidad) is very fine, and the appearance of the hills, covered with tropical trees and vegetation to the very top, striking and grand. It often reminded me of the quieter order of Swiss scenery, and especially of the Lake of Lucerne, *minus* the Alps. Of course it is more luxuriant, and much less sublime. Seen on shore, however, the country is incomparably superior in beauty and richness to Switzerland. No language can give any adequate idea of it. The profuseness, the beauty, is absolutely extravagant. The streets of Port of Spain are all at right angles, and all end in bush or luxuriant savannas. In nearly every street you find the palm, the cocoa-nut, the bread-fruit, the plantain, and the orange or lemon-tree. In all, too, are beautiful flowering shrubs and plants. The very weeds of the street attract your eye, and prompt you to ask their name and quality. Viewed from the hills, the town has a very fine appearance, and you hardly know whether to call it a wood with residences interspersed, or a town in trees.

Yesterday I visited various country districts; and this morning—the thermometer at 90 degrees—we took a ride up one of the hills near the town. I shall never forget the impression of profusion which I received. The road passed, after leaving the end of the street, through a most graceful avenue of bamboo, each plant of great height and elegant form, the whole gradually closing at the top, a Gothic arch of nature's own making. We then caught a view of the town, the Gulf of Paria, gemmed with numerous islands, and the vast hills of the Spanish main on one side, and the steep wooded hills and dells of Trinidad on the other. As we went on, our road became narrower, till, about half a mile from the town, we reached the bush or woods. And what are they like? The very question I have been asking myself ever since I saw them. They are all round me at this moment, now bathed in light, 'dark through excessive brightness,' and now thrown into shade by some passing cloud; and yet I cannot liken them to anything in heaven or earth, or describe them in any terms more likely to give an idea of them, than if I were to describe one of Claude's paintings as made up of sea, marble columns, masts, glimpses of light, and a rich setting sun. Look at that stybiscus, with large scarlet flowers and leaf of dark green; and at that creeper that covers it, with most gigantic leaves, and flower of most delicate yellow; and again at that wild-pea, the colour of our flax-plant, but brighter, and with small leaves shaped like those of the acacia. Beneath the whole is the wild aloe: and behind and above, forming a fitting background, a group of trees of nearly every colour and shape; the feathery palm, with its clean graceful stem; the silk-cotton, with its light-coloured naked branches; the light-green plantain, and the bay-leaf-coloured orange; the whole covered with the bell-rope creeper, so strong and close, as to form an impenetrable wall of vegetation. He must be a very wayward, courageous donkey that can wander far in these thickets! He need not indeed wander at all; for without leaving the road (a narrow bridle path), he can feast on plants and leaves so rich and delicate, as to cast into the shade that most welcome of dainties—the flower and tender sprouts of the Scotch thistle.

Such objects as these scattered over hill and valley, diversified every here and there with small savannas and cane pieces, negro huts and naked children, are the *matériel* of our landscape. But, as above, 'sea, columns, masts, light, and sunset,' is but a poor description of Claude; nor is mine a better description of the scenery of the tropics.

The governor, a very intelligent and liberal man, has ascertained that one in twenty-three of the population attend schools. Estimating the population at 60,000 (the last census), the number of scholars at all the

schools is about 2600. The great body of the people are unable to read, and are lamentably ignorant. The island might supply all Europe with sugar: it produces but 25,000 hogsheads, a quantity which may be raised under circumstances less favourable than those of Trinidad by 5000 labourers.

The great misfortune of this island, as well as of all other islands in the West Indies, is, that the proprietary is over head and ears in debt, and are therefore unable to work their estates with advantage. Nearly all the sugar estates are mortgaged. The mortgagee receives six, eight, ten, or twelve per cent. All the sugar is sent home—not sold on the spot for money—to the mortgagee in his ships, and sold by him on commission, the proceeds being invested, also on commission, in whatever is wanted for the estate. The mortgagee often receives for interest and commission one-fourth of the whole produce; labour and plants nearly all the rest. Estates which are free from mortgage, and are in the hands of owners, everywhere answer well.

The labourer generally receives four bits a day (1s. 8d.), and lives rent-free. Each, too, has a garden as large as he can cultivate. This mixture of wages and rent is a vicious system, and the evils of it are aggravated by the continuance of practices which in slavery were bad enough, but which ought not to be allowed among free men.

Trinidad, December.—One of the 'lions' of the West Indies is a negro quarrel. They never fight or strike, but scream and gabber, and shout like . . . None, however, but themselves, can be their parallel! I never heard such laughter, nor saw such gesticulations! Two ladies were quarrelling to-day near our vessel. Their eyes shot fire; their nostrils were distended; every muscle and ribbon took part in the fray; and at length the bolder of the two (both being as black and as glossy as jet), having reserved her heaviest shot for the last, paused a moment, retired a few steps, and said—'You he! you he!' Then with the emphasis of a cannon ball—'Who are you, you African nigger!' and walked away. Half an hour after, the defeated combatant was pacing the quay, 'discoursing most eloquent music'—to the air. The storm had not yet subsided; and though no one was within hearing, and she was perfectly sober, she was still spending her strength in abuse. I have frequently come in for the tail of such a storm, and supposed that the declaimant was drunk or lunatic, but now find that this is their favourite mode of obtaining relief.

Out of the towns, the roads in Trinidad are made of the natural soil, which is rich, very deep and loamy, and entirely free from stones. The rainy season, which usually begins in June, did not begin this year till July, and has not yet ended. The rain of five months is now, therefore, on the roads, which are entirely undrained, and often not wider than an ordinary footpath. When they are wider, they resemble nothing so much as an Irish bog. Deeming it important to visit various parts of the island, we started on Monday in the steamer for San Fernando, some twenty miles down the coast. There we were joined by another friend; and after hiring horses, started about two o'clock for a station about twelve miles in the interior. Our way lay through brush and sugar-pieces. In the former, the road was covered in on all sides with bell-rope creepers, plantains, and other trees, and was but wide enough for one horse at a time; in the latter, horse and rider were overtopped by the luxuriant sugar-cane, which was seen, when you reached a little rising ground, to cover the whole view. The rain fell heavily, and our horses sunk at nearly every step up to their knees, and often up to the girth. By the time we reached our destination we were completely mudded through. There we found one room, one hammock, one chair, one cup, one knife and fork—no two—the whole on the top of a hill, on a spot which had been recently cleared; while all round it, and within a few yards, was dense forest. Unhappily, our servant, one of the poor outcasts from

Madeira, was ill of fever, so that we had to wait upon ourselves. We first changed our clothes, had a thorough ablution, and a vigorous dry-rubbing; then lighted our wood fire, and had a cup of coffee, with a little sweet cassada-root, the only bread of that district; gave the poor Portuguese some medicine, and composed ourselves to sleep—I in the sole hammock: my companions on the cedar floor. By sunrise we rose—two of us thankful, like Wesley, when in Cornwall, that the skin of one side was left; and all thankful that we were none the worse for our ride. The morning was wet, and the rain came down in true tropical style. We started, however, for another station, distant about twelve miles. The roads were even worse than on the previous day. We had a long ride through brush and cane-pieces, and by seven o'clock, reached the hut of a friend, a black man, who is employed as a teacher. He has also built a neat wooden chapel and schoolhouse: the whole is of cedar, and would have cost us more than L.100. We again changed; and after giving our horses a good feed of Indian corn, and ourselves taking a supper of rice and salt fish, retired to our hammocks (of Indian manufacture), and slept as soundly as the pattering rain would allow. The next morning we had a long chat on business; and about one o'clock, two of us started for San Fernando, distant some fifteen miles. Mr C—— strongly dissuaded us from proceeding, and urged us to return with him to his residence, and thence to San Fernando. But our dry clothes were all used up, and we could not well get them dried again: my companion began to feel chilly and feverish; nor was there any prospect of the weather improving: we had seen all we came to see, and did not feel it right to continue exposing ourselves to the effects of quietness and inaction. We therefore started alone; and after three hours' hard riding up hill and down hill, through rivers and bogs, reached San Fernando by four o'clock: the only accident was, that my companion's horse fell with him, and threw him into the mud literally over head and ears. He was previously 'muddled through,' so that the accident was not serious. At San Fernando we obtained a third change, a dinner, and a passage by the steamer, reaching Port of Spain about half-past ten. Such roads for mud and vegetation I never conceived of; and such is their state for four or five months in every twelve! For conveying sugar and other produce they are wanted only in the dry season, when all is dried, and the soil is burnt nearly to the hardness of brick. The only travellers who use them now are Europeans and others who ride, and the labourers who travel, without encumbrance. All provisions, except yams, sweet potatoes, cassada, Indian corn, and the common fruits, are brought upon the heads of carriers from San Fernando.

During the ride I made the acquaintance of several large lizards, and a couple of scorpions, one of which Mr C—— had caught in the roof of his little hut a few weeks before. It was also my first introduction to large sugar estates, swampy bush, missionary tours in their worst form, Indian houses (of bamboo), Trinidad mud and roads. We are, however, and in spite of all, none the worse. This I ascribe to the free use, internally and externally, of cold water.

As the evening draws on in this island, there are some of the oddest sounds and sights imaginable. They are introduced by the buzzing of an insect, which reminds you of the hum of a room of spinning-jennies. By and by a shrill strong whistle startles you. It might be the railway train leaving Southampton: but no; it is only the rain beetle. Now you hear the frogs; one set howl and snap, like the baying of a pack of fox-hounds a mile or two off; and that cry, so like that of a drowning man, the water gurgling in his throat, is from this gentleman here, whose mouth you see just above the water. He will continue his pleasant melody till the morning; and if the mosquito wake you—or worse still, the prickly heat, a burning, pricking, itching sensation, which attacks your feet and arms—you

can exercise your benevolence in throwing imaginary ropes to imaginary drowning men. In Port of Spain you can hear them all night. These lights fitting up and down—now here, now there—and which lead you to believe that the whole insect world has a ball to-night, and that these are the servants carrying lights for their mistresses, are the fire-flies. The cane-piece and the wood are quite lighted up by them. At Savanna, they startled me into the fear that the roof of our hut was in flames. The humming-birds of the island are known all the world over—very gay and beautiful they are.

Grenada, December.—Friday and Saturday we spent in visiting the governor, the chief-justice, and others. Early in the week we went on board our steamer, and had a glorious parting view of the hills and city of Port of Spain. All the hills throughout the island are in bush, as is most of the land. Out of 1,000,000 acres, only 25,000 are under cultivation; and these yield L.400,000 worth of produce!

We reached Grenada this morning (Monday), and here we stay till Thursday. Not a book-shop in the place! The steamer taking in coals, and the stewards scrubbing the decks. The weather is most unusually wet, so that I am confined on board, and almost entirely below. The sun burns intensely one moment, and the next the sky is overcast, and the rain comes down wholesale (till everything floats) in torrents. Now you see a rainbow on the sea and in the sky, and the shower is gone—to be followed with quite Irish profusion by another, and yet another still. They make the air quite oppressive. Happily, as this letter starts for England, I also go on to Jamaica.

THE BAD FIVE-SHILLING PIECE.

In the farthest house, in a dark, damp, and dreary court of St Giles's in London, two black-looking men and a poor emaciated woman were busy over a charcoal fire, in the back room of the third floor of that rotten and dingy tenement. Moulds and implements of coining lay on the floor and on an old table; and the strong smell of bad gin, from a broken-necked and uncorked bottle, diffused itself around the room. The presence of poverty, vice, crime, and misery characterised the tenement and its tenants. In this place, and under these agencies, our bad five-shilling piece was smelted, and moulded, and stamped into its sorry existence. How it was put into circulation among the sterling current coin of the realm we shall not stop to inquire. From pickpockets to their victims, from them to the shopkeepers, it somehow passed on, until at length it came into the hands of Mrs Hoardlings of the Commercial Road.

Mrs Hoardlings of the Commercial Road was the wife of a tradesman well to do in the general grocery line. Together they had papered up no little amount of cash, on which to retire one day to suburban quietness. They had indeed well picked their plums. Those two or three neat new little cottages in Limehouse-Fields were old Hoardlings's. Cayenne pepper is not stronger than that fact. Then there were several gas shares: tallow candles had opened the way for gas lights: tea, too, was the first letter in tenements: young Hyson, the dashing young Chinese man, had helped his old English friend: full-flavoured Mocha also had often filled his cup. Moreover, his butter had ever worn a rich golden hue, and he had fortunately never buttered his fingers. His starch and his money-till were therefore not far apart. Whether the Hoardlings would ever retire, however, was a matter of considerable doubt to their acquaintances. They had already talked of it for at least the last twelve years. It was true they had no family, but still love of gold was a growing child. Retire, indeed!—not they.

How it ever should have happened that Mrs Hoardlings should have taken a bad five-shilling piece was far beyond her own comprehension. She could scarcely

conceive it possible. Who could have passed it to her? It was certain, however, that she herself had taken it, as her husband had been out during the day on the evening of which she had discovered it in the till. She was not suspicious, but she had some slight misgivings as to a thin lad with a ragged yellow article loosely tied round his neck. He had come in for a pound of candles—fourteen. She had never seen him before, and perhaps never should again. However, she would keep the matter snug—her husband should not know she had been such a stupid. Stand the loss she would not: somebody must be the loser, but that was no reason why she should. Such was the philosophy of the Commercial Road.

It was on a Saturday evening, at a late hour, that the shop was still full of customers. Mrs Hoardlings, with her sleeves tucked high up the arm, was up to her eyes in business, and also up to something else. 'Half-a-pound of twelves,' threepence; 'bacon,' fippence; 'pepper,' ha'penny; 'pound of moist,' fourpence; 'half-a-pound of butter, salt,' sixpence; 'ounce and half of tea,' fourpence—ha'penny: 'threepence—eightpence—ha'penny—one and a ha'penny—one and six and a ha'penny—one and elevenpence, ma'am.' Just as this was settling, in came Bill Simmons the omnibus conductor, puffing and blowing, and not a little intoxicated. 'Ounce of best shag, and change for this here,' said Bill, ringing a half-sovereign on the counter. 'As quick as you please, missis, for I am in a hurry,' he added. Mrs Hoardlings was very quick. The tobacco was soon weighed and placed in Bill's black bone box, and the change given from her pocket—a five-shilling piece, and some odd silver and coppers. With this Bill was off. Need we say what five-shilling piece went with him?

In the depths of her mind, Mrs Hoardlings had before determined that somebody must be the loser by that bad five-shilling piece, but that that was no reason why she should be so. Noble determination!—generous resolution!—honest philosophy of the Commercial Road! Was Bill Simmons, the poor 'busman, then to be the loser, and that, too, when omnibus fares were being reduced on all sides, and omnibus servants having their wages in consequence curtailed? Just so—this was the practical point in Mrs Hoardlings's Commercial Road ethics. Somebody must be the loser—not she. Why then not Bill Simmons as well any one else? Why then not Bill Simmons more than any one else? Bill Simmons was a stranger to Mrs Hoardlings: Mrs Hoardlings was a stranger to Bill Simmons. All the better this. Bill Simmons drove a Clapton omnibus. He only happened to be out in the Commercial Road that night on what he called a jolly spree. Mrs Hoardlings, it is true, never knew all this. She knew that he was a stranger to the shop, and speculated accordingly. As it was, her speculation succeeded. Bill Simmons took no note of the shop or the money. Mrs Hoardlings was safe. What mattered it that Bill Simmons was poor; somebody must lose—not she. It was true the Hoardlingses had gas shares, and those neat new little cottages in Limehouse-Fields. It was true that they thought of retiring, and that the loss of five shillings would not have been much. Was it honest?—that thought never occurred to Mrs Hoardlings—never entered into the ethics of the Commercial Road. Somebody must lose—not she. With his bad luck, poor Bill Simmons! With all her savings, still poorer Mrs Hoardlings! Fortunate was it for the former that he had closed up his day's account with the clerk of the company before taking her bad five-shilling piece.

It was Sunday evening. Bill was about starting with his omnibus from Clapton on its return to town. Eleven insides and three outs had already taken their places. Up came a gentleman and lady out of breath, for it was past ten o'clock, and they were afraid of losing the ride.

'Town, sir?' said Bill.

'Room inside?' said the gentleman.

'Just room for two,' was the answer; and the poet and his wife—for such they were—took their seats in the vehicle. The omnibus rattled off along the Clapton Road, through Hackney, past the Eastern Counties Railway terminus, to the Flower-Pot in Bishopsgate Street, where it stopped. Out went a white-headed old gentleman very carefully. Out rolled a fat lady, equal to any two other fares in size and weight. Out popped a dapper young clerk, paid his fare, and was off with a twirl of his cane. Out came the poet and his wife, the former fumbling in his trousers pocket.

'Ellen, my dear,' said the poet, 'I thought I had change. Did I give it you?'

'No,' answered the wife; 'you put it in your pocket.'

'It is not here now, then,' said he. 'It was six or seven shillings, and I recollect I put it in loosely.'

'Feel in the other pockets, my dear,' said the wife. The poet did so. Meanwhile the other passengers had paid their fares, and Bill Simmons stood waiting for his. In vain the pockets were each examined. There was the poet's purse, but no loose silver was there.

'Turn the one out, sir, where you thought it was!' exclaimed Bill. The poet did so. There was a hole in it; the purse had remained safe, but the loose silver had worked its way out.

'Thank God,' said the poet, 'there is no thief in the matter; that sin is in no one's heart.'

'Let's look in the 'bus,' said Bill. A lantern was procured, and a search made among the straw; but no money was found. The loss must have taken place at Clapton, when they were hastening after the omnibus.

'It cannot be helped,' said the poet, taking out his purse; 'you must give me change.'

The purse was a green silk one, on which was a three-stringed lyre, worked in gilded beads by the poet's wife. It contained one sovereign. The poet handed it to Bill Simmons, and received the change, among which was the bad five-shilling piece, which had rested undisturbed in Bill's pocket since it had passed from the honourable hands of Mrs Hoardlings. Bill was innocent, but he had not been tempted.

The poet and his wife wended their way to their lodgings. 'It is a sad loss seven shillings,' said the poet sorrowfully.

'Never mind,' said the wife, struggling to keep up her spirits, 'the "Sixpenny Magazine" owes five pounds.'

'When will it pay it?' said the poet despairingly.

Thus hoping and fearing, they walked on, until they reached the Commercial Road. They stopped at the house where they lodged. What name is that over the shop front?—surely it is HOARDLINGS! Yes, the poet lodged in the first floor of Mrs Hoardlings—the identical Mrs Hoardlings. How strange!—the bad five-shilling piece, which had gone out on Saturday night, had come back on Sunday night to the same house.

On rising the next morning after a restless night, the poet's wife reminded her husband that that day their week's rent was due. He had not forgotten it.

'What shall we do, love?' said she.

'Pay, by all means,' answered he. 'I have not forgotten the woman's insolence when we owed her a week before.'

Poor poet!—on his purse, indeed, was worked a lyre with golden strings, but the sovereign he had changed the preceding night was the only one that he possessed. Thus, then, arose the immediate consideration of ways and means. By contributions to the magazines, and articles for the newspapers, he seldom made more than thirty shillings per week, and sometimes not twenty. Then the editors were not always punctual in their payments; and some of his literary debtors sinned more than by want of punctuality. At the present crisis he had just nineteen shillings in hand. Of this, twelve shillings were owing Mrs Hoardlings as rent for her two furnished first-floor rooms, and five-and-sixpence for sundry items procured at her shop during the past week, which, when paid, would reduce their capital to exactly eighteenpence. However, the poor, proud poet

determined to pay it, and to trust to his week's exertions, and the recovery of his back debts, for the necessary supplies.

Accordingly, as usual, Mrs Hoardlings was called up. She came, looking most graciously. A bland smirk displayed her yellow teeth.

'We would pay our rent, Mrs Hoardlings,' said the poet's wife.

'Thank ye, ma'am,' replied that excellent dame.

The purse with the lyre of gilded strings was produced; the money was counted out—a five-shilling piece, two half-crowns, and seven-and-sixpence in small change. Mrs Hoardlings re-counted it hesitatingly.

'It is right, I believe,' said the poet's wife.

'Seventeen-and-sixpence certainly; but then this five-shillinger,' said Mrs Hoardlings, inspecting that coin rather curiously, which, whether known or unknown, was an old acquaintance.

'What do you mean, Mrs Hoardlings?' said the poet, rising from his seat, and approaching the table.

'That this here five-shillinger is a bad un—that's all,' said Mrs Hoardlings, bridling up. 'In coorse,' added she, 'I do not say as how you knowed it.'

'A bad one!' repeated the poet, turning red—a sign much more frequently of nervousness than of guilt. 'Let me see it, Mrs Hoardlings!' He felt the five-shilling piece—it felt soft and greasy; he tried it upon the table—it emitted a dead leaden sound; he examined its rim—it was irregular. 'You are right, Mrs Hoardlings,' said he, his face changing to white; 'it is a bad one. I took it from an omnibus man last night.'

'Oh the rascal!' exclaimed Mrs Hoardlings, almost bursting with righteous indignation.

'Who would have thought he would have cheated us under such circumstances?' murmured the poet's wife.

'Let us not judge, my dear,' said the poet, turning to his wife; 'perhaps the man was no more aware of its being a bad coin than ourselves. Mrs Hoardlings,' he continued, looking rather sheepishly at that lady, 'I am very sorry; but as this has occurred, I have not the means to settle your bill. We had the misfortune to lose some cash last night, in running after the omnibus whose conductor passed us this bad five-shilling piece. You can take enough for the rent, and we will settle the bill for the articles furnished when we pay next week.'

Mrs Hoardlings hesitated a moment, and then replied, 'What must be, must, I suppose. Haven't got, can't pay anyhow. But it's best as I speak to the master; and with these words, and a most mysterious air, she departed with the good twelve-and-sixpence, leaving the bad five-shilling piece on the table.

An age of suspense was crowded in a minute for the poet and his wife. Presently in bounced Mrs Hoardlings again, without the usual ceremony of rapping at the door.

'Master says that he can't understand trusting!' she exclaimed. 'Our business has always been a ready-money one. Howsumever, as you are here, we'll try another week; but as we can't afford losing, master says as how you'll please to take a week's warning to leave. Litterary people is so unsartin, as you knows as well as we,' concluded Mrs Hoardlings in a justificatory tone.

'Very well, Mrs Hoardlings,' replied the poet. 'I understand what you mean, and take your notice; but I have no doubt of being able to pay you next week.'

'Hope so, sir,' said Mrs Hoardlings retiring.

Oh the poor poet! Oh the poorer Mrs Hoardlings! Gas shares! Neat new little cottages at Limehouse-Fields! Bad five-shilling piece!

A sad week was it to the poet. He wrote to the editors who owed him money; he called at their offices: it was in vain. Some were out of town; others, more honestly, declared that they would only settle at their own convenience, and those contributors who were dissatisfied, might suit themselves elsewhere. A sad week also was it for the poet's wife. She was a comfortable little

body, and liked to prepare tit-bits to surprise her husband. They fed badly that week, however; although, unknown to the poet, she had pawned her earrings to furnish a rump-steak for the Sunday dinner. Meanwhile the bad five-shilling piece had rested untouched on the mantelpiece. There it lay, the unconscious instrument which had accelerated, if not produced, the present misfortune of the poet. On the Sunday evening the poet noticed it; and saying, 'Poor thing! thou shalt do no one more injury,' threw it into the fire. It was soon a formless lump of lead.

The morning of pay-day arrived. A sad seriousness sat on the faces of both the poet and his wife. He had determined to pay, and to leave. He had given up all hopes of receiving any money to meet the emergency; and he therefore took the watch his father had left him to the pawnbroker's, and returned with the sum advanced upon it, which was more than was requisite to pay Mrs Hoardlings's claims. She accordingly was summoned up, and appeared in sullen state. The money was counted out to her, and the poet then stated that, in agreement with her notice, they were about departing.

'Going, sir!' said Mrs Hoardlings; 'I only meant you to go if you could not pay!'

'Probably so,' said the poet; 'but we received formal notice, Mrs Hoardlings, and we intend to abide by it.'

Just at this moment the postman rapped at the street-door, and the girl ran up with a letter for the poet. He opened it, and found enclosed a cheque for £5 from the 'Sixpenny Magazine.' The poet's wife smiled. Mrs Hoardlings also having caught a glimpse of the cheque, and probably magnified its amount, was the more urgent for them to stop. She was sure she did not wish them to part—not she. Only her master and she were hard-working people, and couldn't afford to lose. She begged their pardon if she had been too quick—that she did. However, the poet was determined to leave; and he did so. His wife and he soon found some neat little lodgings farther towards the country at a cheaper rent. There he struggled on with a good conscience. Three months afterwards he passed Mrs Hoardlings, and her first floor was yet unlet. Moreover, the poet made a song, and the poet's wife sung it:—

'Owls and bats come home to roost,
Larks soar upward to the sky;
Evil deeds are birds of night,
Holy thoughts to Heaven fly.
Pass a wrong, and it will back;
Do the right, and never fear;
For evil deeds there is an eye,
For evil words there is an ear.
Evil deeds, like money bad,
Will come back to the giver;
But innocence, like gold in fire,
Is purified for ever.'

LAND AND FRESH-WATER SHELLS.

ALMOST every one who has resided at any period of his life near the seashore, more especially if it has been at that joyous age when all natural objects possess a charm which too often becomes blunted in after years, knows something of marine shells. Their beautiful forms and colours, or shining pearly whiteness, as we picked them out of the yellow sand, or searched for them among the drifted pebbles and sea-weeds, are frequently among our earliest and most pleasing recollections. But how few people have any idea that there are such things as land and fresh-water shells! With the exception of the common garden snail (*Helix aspersa*), which is familiar to most people, this class of animals is but little known except to the scientific. Yet under almost every stone, and in every pond, ditch, and streamlet, are beautiful little molluscs, with forms as

perfect as any of their marine congeners, silently yet certainly fulfilling their appointed offices in the wondrous scheme of the Creator, by affording food to numerous birds, fishes, and small quadrupeds.

Land shells may be found almost everywhere. Moss, dead leaves, decayed wood, and beneath stones, are their favourite haunts, where they remain during the winter months, and in dry weather, in summer, coming out after rain to feed upon the adjacent herbage. Although very voracious, as their ravages among our fruit, flowers, and vegetables amply testify, yet they can remain for lengthened periods without food, and frequently retain their vitality long after they have been placed as specimens in the cabinet of the conchologist. This is easily explained by the faculty they possess of closing the mouth of the shell by a film of mucus; which in long-protracted drought, and on the approach of winter, is in some species thickened by deposits of shelly matter, until it becomes a calcareous plate, which effectually protects the inmate till the return of more genial weather. This lid, or *epiphragma*, as it is termed, is easily observed at any time during the winter months in the common snail, in which, however, it is only membranous. In a similar manner, the shell is formed by successive deposits of mucous and calcareous secretions, and is, in fact, moulded on its body, as it grows, by the animal, which likewise has the faculty of repairing in the same way all fractures which are not of sufficient extent to derange the natural functions. In the summer months, snails may often be found with the edge of the shell thin and soft. This is the first or mucous deposit, and forms the outer coat, or *epidermis*, of the shell, within which the calcareous matter is subsequently deposited; the beautiful spots and bands on the outer surface being placed between by glands adapted for the purpose.

In this, as in many other departments of nature, different species frequent different soils and geological formations. Thus some are peculiar to heaths and sandy maritime pastures, where they are sometimes so abundant, when roused from their retreats by summer showers, as to have given rise to the notion that they fall from the clouds with the rain; others frequent chalky districts; many are found in woods and damp shady places; and a few in elevated and rocky situations. The British species are upwards of seventy in number, and have been divided into various genera, characterised by the form of the shells and structure of the animals. The most important of these, as containing the greatest number of species, and the largest in size, is that of the snails (*Helix*). This genus contains some of our most beautiful land shells, and comprises every gradation in size, from the handsome *Helix pomatia*, nearly two inches in diameter, to the minute *H. lamellata*, not larger than a mignonette seed. Their colours are often disposed with great elegance in spots, and bands of dark brown or black, upon a light-brown, yellow, or pink ground; and nothing can surpass the delicacy of tinting and pencilling in such species as the banded snail (*Helix pisana*). Although rather repulsive from their slimy nature, several of them have been used as food. The edible snail (*Helix pomatia*), in particular, has been employed in this way by the continental nations since the time of the Romans, who fattened them on purpose. At one time it seems to have been even admitted at our own tables, as Martinus Lister, in his 'Historia Animalium Angliæ, Lond. 1678,' mentions the manner of cooking them in his time: 'Coquantur ex aqua fluviatili, et, adjectis oleo, sale, et pipere, lautum ferculum præparant.' Ben Jonson also mentions this dish as a delicacy—

— 'Neither have I
Dressed snails or mushrooms curiously before him.'

In Provence, the *Helix aperta*, or tapada snail, a much smaller species, is eaten, and considered the most delicate kind. The common snail 'is sold,' according to Mr Gray, 'in Covent-Garden market, as a cure for diseases

of the chest, boiled in milk; and quantities are collected, and packed in old casks, and sent to the United States of America as delicacies.' The edible snail, if more abundant in this country than it is, might also be made use of in another way, as Dr Turton observes—'After the animal has been extracted, there remains at the bottom of the shell a glairy transparent matter, which affords one of the best and most durable cements in nature, resisting every degree of heat and moisture.'

The animals of this genus afford an acceptable food in severe weather to those delightful songsters of our woods and gardens, the blackbird and song thrush, whose efforts to fracture the protecting shell are sometimes most interesting. One species, the *Helix nemoralis*, or girdled snail, is frequently infested by a parasitic insect, the larva of a small yellowish beetle, the *Drilus flavescens* of entomologists; and it is perhaps not generally known that the chief food of the glow-worm (*Lampyrus noctiluca*) in the larva state consists of young snails, which it seizes, kills, and finally devours. The empty shells of several species are likewise appropriated by the mason-bees of the genus *Osmia*; and in these rather singular receptacles they build their cells, and store up a supply of food for their progeny. This curious fact seems to have been first recorded by Huber, and has since been frequently observed by our English entomologists.

The twist-shells (*Bulimus*) are another interesting genus, and are remarkable, along with the close-shells (*Clausilia*), for their elegant spiral forms. The latter have also the peculiarity of a reversed aperture, the mouth of the shell opening to the left hand instead of the right—a peculiarity of structure which is also observable in one or two other genera and species. But perhaps the most singular of all are the little chrysalis and whorl-shells (*Pupa* and *Vertigo*), found sticking to the under sides of stones in woods and dry pastures. They are of almost equal width throughout their whole extent, resembling mummies or the transition state in insects, and generally have the inside of the mouth set round with small shining points or teeth, the use of which does not seem satisfactorily ascertained, though it is probable that they serve in some degree to prevent the intrusion of enemies, like the singular elastic valve which closes the mouth of the *Clausilia*, or the winter *epiphragma* of many species.

Fresh-water shells are even more varied and beautiful in their forms than the terrestrial species, which they much resemble in many points of their economy. They are generally distributed over the fresh waters of our island, some species being found in rivers and running streams, others in ditches and stagnant pools, and many in lakes and ponds. They may be divided into univalves and bivalves: the former consisting, like the land shells, of one piece; the latter of two, connected by a hinge. Most of the univalves, although living in a different element, respire free air, like the land shells, and come to the surface occasionally for this purpose. At such times they crawl up the stems and leaves of water plants, or the sides of stones, sometimes coming entirely out of the water. They have also the faculty, in common with the bivalves, of floating with their backs downwards, and with their fleshy foot extended on the surface, which they thus traverse as on a solid plane. The bivalves, and one or two genera of the univalves, respire water by means of gills or branchiæ, and are therefore strictly aquatic.

These shelly denizens of our ponds and ditches are not so numerous in species as those of the land, but generally exceed them in individual numbers. Altogether, there are about fifty-two species indigenous to Britain, of which thirty-five are univalves, and the remaining seventeen bivalves. Among the univalves we may notice the pond snails (*Limnæida*), comprising several genera of great elegance, the principal of which are the mud-shells (*Limnæa*) and the coil-shells (*Planorbis*). The former may be frequently seen sticking, like small muddy excrescences, on the sides of submerged stones,

or the smooth surface of the mud, where they are easily overlooked by the unpractised eye; but when brought to the surface, and freed from the mossy incrustation with which they are covered, we have elegant, spirally-twisted shells, transparent, and nearly colourless, or tinted with various shades of brown, according to the species or the nature of the soil. The coil-shells are well described by their name. Instead of being twisted in a spiral form, they are evenly coiled in a gradually-increasing circle, like the fossil *Ammonites*. In habits they resemble the *Limnæa*, with this exception, that they are seldom found among mud. Then we have the little fresh-water limpets (*Ancylus*), which adhere to the stones in brooks, and sometimes in lakes, where the water is clear. One species adheres firmly to aquatic plants.

Turning to the bivalves, we have the gigantic swan mussel (*Anodon cygneus*), which lives deep in the mud of lakes and ponds, and grows upwards of half a foot in width. This shell occasionally contains pearls, though not so frequently as the fresh-water pearl mussel (*Unio margaritifera*), which, from the nature of its habitat in rocky mountain streams and rivers, is more liable to those incidental injuries and irritations to which the formation of these much-prized productions may generally be traced. The pretty little shells of the genera *Cyclas* and *Psidium* present a marked contrast to their congeners just mentioned, in their small and frequently diminutive size. They are very compact and neat in form, somewhat resembling miniature cockles, and are found abundantly both in stagnant and running waters, generally lying at the bottom among the mud and sand.

In concluding this hasty sketch of our land and fluviatile shells, we would earnestly recommend all lovers of nature to investigate them for themselves. They are within the reach of every one who has time and inclination for a country walk, and will well repay the trouble of searching for them in their respective haunts, by the gratification and instruction they are so well fitted to afford.

MOIRA HOUSE AT TWO EPOCHS.

CHANGE and decay are such unfailing attendants on humanity, that their ravages do not surprise, however they may afflict us; so that, after a long separation from the friends of our early years, we are quite prepared, on meeting them again, to find that the freshness and buoyancy of youth have been succeeded by the infirmities of age. But when decay affixes its stamp prematurely on objects of a more enduring character, a feeling of disappointment arises within us, and we are almost surprised to find how deeply we may be moved by the crumbling of stone, or the dilapidation of some well-remembered edifice.

In no other place, perhaps, are such emotions more frequently awakened than in Dublin, where the fine buildings which, about fifty years ago, were the abode of rank and wealth, are now neglected and decayed. One of her former palaces has in recent times been the receptacle of misery, singular both in its character and its amount; and the contrast between its earlier and its later condition has fixed itself too vividly in my memory ever to be forgotten.

Upwards of sixty years ago, I was, during my early youth, a frequent guest at Moira House, a princely dwelling, situated on Usher's Island, which at that time was a more fashionable quarter of Dublin than it is in the present day. It was then inhabited by the Earl and Countess of Moira and their family. Lady Moira (daughter of the celebrated Countess of Huntingdon) was a woman of superior intellect and acquirements, so that she delighted to gather around her all who had any pretension to literary or professional celebrity. The family party was a large and distinguished one, comprising the late Marquis of Hastings (then General Lord Rawdon), Lord and Lady Granard, and Lord and Lady Mount-

cashel; in addition to whom there were two younger sons and one unmarried daughter, all in the prime of life. My companions were among the grandsons of the earl; and while we were busy at one end of the saloon playing at a round game, or devising some boyish frolic, the elder ones of the party were pursuing, in the same apartment, occupations or amusements more suitable to their years. But the aged countess was never too much engaged with her brilliant circle to omit attending to the enjoyment of her younger guests, in whose recreations she always took a kind and lively interest.

A few years later I joined my regiment, and left Ireland, to which my visits were necessarily brief during the ensuing half century, which was a stirring and busy period of my life—part of it being devoted to the service of my country in the four quarters of the globe.

About ten or twelve years ago, I was passing a few months in Dublin, and being desirous to revisit the scenes of my early and happy days, I bent my course to Moira House, when, to my astonishment, I found it the receptacle of all the most miserable beggars in Dublin, who were congregated there to the amount of 2400 men, women, and children, who were daily fed and employed in that house. The reader may judge of my feelings on entering the drawing-room, which I remembered as having been once filled with all that was noble and distinguished in the land, now crammed with poor ragged women, who were employed in spinning and other occupations. If this apartment had been the scene of healthy, cheerful industry, the change would have been less painful to me; but the squalid poverty of its crowded inmates, and their dispirited looks, made the scene a lamentable one indeed. The atmosphere was stifling; and among the compressed ranks of spinners there was perfect stillness, interrupted only by the dull, ceaseless murmur of the spinning-wheels. This unbroken silence among a mass of Irishwomen was so remarkable, that we were almost startled at the sound of a voice, which began in low sweet tones to sing one of the most mournful of our national melodies. We gave a glance towards the quarter from whence the sound proceeded, and saw, in a corner of the apartment, a young, sad-looking woman, wrapped up in a gray cloak, whose hood partially concealed her features. On leaving the room, we passed close to her side, but she did not even raise her head to look at the strangers. Her song was the song of despair; and it was only too well suited to a position, than which none can be conceived more degrading to humanity—where our fellow-beings were driven in to share the offals of the rich man's table, and then sent abroad at the approach of night to seek a wretched shelter during the hours of darkness.*

I went to the great dining-parlour, which I found occupied by a school of 200 boys, under the National Board, but where I grieved to find their regulations not attended to. On inquiring whether the boys were in the habit of reading the Scripture Extracts provided by the Board, the volume was slowly and reluctantly taken down out of a bookcase, when it became evident, from its state of perfect cleanliness, that no enemy except dust had hitherto invaded its peaceful privacy. We next visited the room which, in former days, had been appropriated to the housekeeper's use—a well-remembered place, where my young companions and I had often disturbed the ancient dame by our mischievous pranks. It was now converted into an Infant School, whose pupils seemed as unruly as they were ragged; for they were scattered in groups around the room, while their teacher, an uncouth-looking young woman, flourished unceasingly a stout wand (her badge of office) over the infants' heads, with little effect apparently besides that of eliciting a few lusty roars from her pupils. For aught we could see, the whole mystery of education was comprised in this wholesome exercise of authority; for on inquiring whether they were not supplied with pictures and large-lettered sentences, such as are used in other Infant Schools, we were coldly answered in the negative. We pursued

* We were informed that they received a penny each to pay for their night's lodging.

our way to the kitchen, where we were shown huge boilers in which potatoes and meal were being prepared for the mid-day repast. These messes were made more savoury by the addition of bones, which had been received from the wealthier parts of the city; and it was a humiliating spectacle to see men and women dragging along small covered dog-carts, filled with bones and scraps which had been given them out of the areas of their richer brethren. Such was the food apportioned to the miserable thousands assembled daily within the walls of Moira House, or, as it was then called, the Mendicity House.

A few minutes after having quitted its precincts, we found ourselves in Grafton Street, pressed by a throng of the gayest equipages in Dublin, many of them crowding around shops whose windows displayed every variety of brilliant texture or of costly jewellery. At any other time we might have enjoyed the life and animation of the scene, but at that moment it presented so painful a contrast to the place we had just left, that we hastened our steps, and were not sorry to find ourselves in a more sober and tranquil part of the city.

Since that day I have not felt a wish to revisit Moira House.

THE NIGHT SIDE OF NATURE.

SECOND AND CONCLUDING ARTICLE.

THE subjects in the former paper are those in which the living are concerned. We now come to those which regard the dead. Here incredulity is disposed to make its most determined stand. Very well; but our object is to display the kind of matter this book is composed of. Mrs Crowe remarks with justice, that our efforts to extinguish the almost instinctive belief in the young are seldom very effectual; and she adds, 'Suppose the subject were duly investigated, and it were ascertained that the views I and many others are disposed to entertain with regard to it are correct; and suppose, then, children were calmly told that it is not impossible but that on some occasion they may see a departed friend again; that the laws of nature, established by an All-wise Providence, admit of the dead sometimes revisiting the earth, doubtless for the benevolent purpose of keeping alive in us our faith in a future state; that death is merely a transition to another life, which it depends on ourselves to make happy or otherwise; and that whilst those spirits which appear bright and blessed, may well be objects of our envy, the others should excite only our intense compassion'—in that case terror might be more thoroughly banished.

The examples adduced by Mrs Crowe are so numerous, as to justify her in saying that the day of these things has never been, and is not now truly past. The number might become tedious, were they not classed in groups according to certain leading features, and mixed up with speculations, or attempts to rationalise the facts under natural laws—all of which are ingenious, while some, with any matter less opposed to common tendencies of belief, could not fail to be successful. The following story is described by Mrs Crowe as well authenticated:—

In the year 1785, some cadets were ordered to proceed from Madras to join their regiments up the country. A considerable part of the journey was to be made in a barge, and they were under the conduct of a senior officer, Major R—. In order to relieve the monotony of the voyage, this gentleman proposed one day that they should make a shooting excursion inland, and walk round to meet the boat at a point agreed on, which, owing to the windings of the river, it would not reach till evening. They accordingly took their guns, and as they had to cross a swamp, Major R—, who was well acquainted with the country, put on a heavy pair of top-boots, which, together with an odd limp he had in his gait, rendered him distinguishable from the rest of

the party at a considerable distance. When they reached the jungle, they found there was a wide ditch to leap, which all succeeded in doing except the major, who, being less young and active, jumped short of the requisite distance; and although he scrambled up unhurt, he found his gun so crammed full of wet sand, that it would be useless till thoroughly cleansed. He therefore bade them walk on, saying he would follow; and taking off his hat, he sat down in the shade, where they left him. When they had been beating about for game some time, they began to wonder the major did not come on, and they shouted to let him know whereabouts they were; but there was no answer; and hour after hour passed without his appearance, till at length they began to feel somewhat uneasy. Thus the day wore away, and they found themselves approaching the rendezvous: the boat was in sight, and they were walking down to it, wondering how their friend could have missed them, when suddenly, to their great joy, they saw him before them making towards the barge. He was without his hat or gun, limping hastily along, in his top-boots, and did not appear to observe them. They shouted after him, but as he did not look round, they began to run, in order to overtake him; and indeed fast as he went, they did gain considerably upon him. Still he reached the boat first, crossing the plank which the boatmen had placed ready for the gentlemen they saw approaching. He ran down the companion stairs, and they after him; but inexpressible was their surprise when they could not find him below. They ascended again, and inquired of the boatmen what had become of him; but they declared he had not come on board, and that nobody had crossed the plank till the young men themselves had done so. The body of Major R— was found by them in a neighbouring well, into which he was supposed to have accidentally fallen.

In a case like this, the common theory of spectral illusion must be allowed to have little force, since five persons saw the object at once.

There is a large class of cases where a trouble about some secular matter seems to be the cause of the return to common haunts; often it is trouble about what appears comparatively a trifle—as the return of a borrowed article of furniture, or the imparting of information about something that has been lost. As formerly mentioned, when a natural law is supposed, the triviality of the object is nothing in point. A more perplexing circumstance is, the communication being sometimes made, not to the person chiefly interested in the matter, but to some other person. This, however, our author overcomes by the suggestion, that susceptibility in the seer is also concerned. The chief person may be too much wrapped up in the sensuous envelope to be sensible of such appearances, and it may therefore be necessary to try another. She joins the German philosophers in their ideas about the destinies of spirits after they leave the body; some being too much clogged with the impressions and tendencies of the material world, to be able to pass at once forward into another sphere, though such may be by and by attained. In this intermediate stage they cling to the earth, hovering about the scenes where they have passed their mortal days: in some instances, from particular causes—as from great guilt or great suffering—this haunting of earthly localities lasts a long time, even centuries. This brings us to the section on haunted houses.

We might suppose that this was a thing known only to our ancestors. It appears, however, that there are still many haunted houses in this civilised land. There is one at Willington, between Newcastle and North Shields, belonging to a very respectable member of the Society of Friends, which has attracted much local attention. So lately as 1840, a gentleman named Drury, a determined sceptic, undertook to pass a night in this house with a friend; and, very unexpectedly to himself, saw 'the figure of a female attired in grayish garments, with the head inclining downwards, and one hand pressed upon the chest as in pain.' He rushed upon it, but fell

in a swoon, from which he did not recover for three hours.

Amongst the various stories related under this head, a clear superiority in all respects is to be awarded to one reported to our author by a member of a distinguished English family, who was herself concerned in the series of transactions. The narration is as follows:—

‘Sir James, my mother, with myself and my brother Charles, went abroad towards the end of the year 1786. After trying several different places, we determined to settle at Lille, where we found the masters particularly good, and where we had also letters of introduction to several of the best French families. There Sir James left us; and after passing a few days in an uncomfortable lodging, we engaged a nice large family-house, which we liked much, and which we obtained at a very low rent, even for that part of the world.

‘About three weeks after we were established in our new residence, I walked one day with my mother to the banker’s, for the purpose of delivering our letter of credit from Sir Robert Herries, and drawing some money, which being paid in heavy five-franc pieces, we found we could not carry, and therefore requested the banker to send, saying, “We live in the Place Du Lion D’or.” Whereupon he looked surprised, and observed that he knew of no house there fit for us, “Except, indeed,” he added, “the one that has been long uninhabited, on account of the *revenant* that walks about it.” He said this quite seriously, and in a natural tone of voice; in spite of which we laughed, and were quite entertained at the idea of a ghost; but at the same time we begged him not to mention the thing to our servants, lest they should take any fancies into their heads; and my mother and I resolved to say nothing about the matter to any one. “I suppose it is the ghost,” said my mother laughing, “that wakes us so often by walking over our heads.” We had, in fact, been awakened several nights by a heavy foot, which we supposed to be that of one of the men-servants, of whom we had three English and four French; of women servants, we had five English, and all the rest were French. The English ones, men and women, every one of them, returned ultimately to England with us.

‘A night or two afterwards, being again awakened by the step, my mother asked Creswell, “who slept in the room above us?” “No one, my lady,” she replied; “it is a large empty garret.”

‘About a week or ten days after this, Creswell came to my mother one morning, and told her that all the French servants talked of going away, because there was a *revenant* in the house; adding, that there seemed to be a strange story attached to the place, which was said, together with some other property, to have belonged to a young man, whose guardian, who was also his uncle, had treated him cruelly, and confined him in an iron cage; and as he had subsequently disappeared, it was conjectured he had been murdered. This uncle, after inheriting the property, had suddenly quitted the house, and sold it to the father of the man of whom we had hired it. Since that period, though it had been several times let, nobody had ever stayed in it above a week or two; and for a considerable time past it had had no tenant at all.

“And do you really believe all this nonsense, Creswell?” said my mother.

“Well, I don’t know, my lady,” answered she; “but there’s the iron cage in the garret over your bedroom, where you may see it if you please.”

‘Of course we rose to go; and as just at that moment an old officer, with his Croix de St Louis, called on us, we invited him to accompany us, and we ascended together. We found, as Creswell had said, a large empty garret, with bare brick walls, and in the farther corner of it stood an iron cage, such as wild beasts are kept in, only higher: it was about four feet square, and eight in height, and there was an iron ring

in the wall at the back, to which was attached an old rusty chain, with a collar fixed to the end of it. I confess it made my blood creep when I thought of the possibility of any human being having inhabited it! And our old friend expressed as much horror as ourselves, assuring us that it must certainly have been constructed for some such dreadful purpose. As, however, we were no believers in ghosts, we all agreed that the noises must proceed from somebody who had an interest in keeping the house empty; and since it was very disagreeable to imagine that there were secret means of entering it by night, we resolved, as soon as possible, to look out for another residence, and in the meantime to say nothing about the matter to anybody. About ten days after this determination, my mother, observing one morning that Creswell, when she came to dress her, looked exceedingly pale and ill, inquired if anything was the matter with her?

“Indeed, my lady,” answered she, “we have been frightened to death; and neither I nor Mrs Marsh can sleep again in the room we are now in.”

“Well,” returned my mother, “you shall both come and sleep in the little spare room next us. But what has alarmed you?”

“Some one, my lady, went through our room in the night: we both saw the figure, but we covered our heads with the bedclothes, and lay in a dreadful fright till morning.”

‘On hearing this, I could not help laughing, upon which Creswell burst into tears; and seeing how nervous she was, we comforted her by saying we had heard of a good house, and that we should very soon abandon our present habitation.

‘A few nights afterwards, my mother requested me and Charles to go to her bedroom and fetch her frame, that she might prepare her work for the next day. It was after supper; and we were ascending the stairs by the light of a lamp which was always kept burning, when we saw going up before us a tall, thin figure, with hair flowing down his back, and wearing a loose powdering-gown. We both at once concluded it was my sister Hannah, and called out, “It won’t do, Hannah! You cannot frighten us!”—upon which the figure turned into a recess in the wall; but as there was nobody there when we passed, we concluded that Hannah had contrived somehow or other to slip away and make her escape by the back-stairs. On telling this to my mother, however, she said, “It is very odd! for Hannah went to bed with a headache before you came in from your walk;” and sure enough, on going to her room, there we found her fast asleep; and Alice, who was at work there, assured us that she had been so for more than an hour. On mentioning this circumstance to Creswell, she turned quite pale, and exclaimed that that was precisely the figure she and Marsh had seen in their bedroom.

‘About this time my brother Harry came to spend a few days with us, and we gave him a room up another pair of stairs, at the opposite end of the house. A morning or two after his arrival, when he came down to breakfast, he asked my mother angrily, whether she thought he went to bed drunk, and could not put out his own candle, that she sent those French rascals to watch him. My mother assured him that she had never thought of doing such a thing; but he persisted in the accusation, adding, “Last night I jumped up and opened the door, and by the light of the moon, through the skylight, I saw the fellow in his loose gown at the bottom of the stairs. If I had not been in my shirt, I would have gone after him, and made him remember coming to watch me.”

‘We were now preparing to quit the house, having secured another, belonging to a gentleman who was going to spend some time in Italy; but a few days before our removal, it happened that a Mr and Mrs Atkins, some English friends of ours, called, to whom we mentioned these strange circumstances, observing how extremely unpleasant it was to live in a house that

somebody found means of getting into, though how they contrived it we could not discover, nor what their motive could be, except it was to frighten us; observing, that nobody could sleep in the room Marsh and Creswell had been obliged to give up. Upon this Mrs Atkins laughed heartily, and said that she should like, of all things, to sleep there, if my mother would allow her; adding, that, with her little terrier, she should not be afraid of any ghost that ever appeared. As my mother had of course no objection to this fancy of hers, she requested Mr Atkins to ride home with the groom, in order that the latter might bring her night-things before the gates of the town were shut, as they were then residing a little way in the country. Mr Atkins smiled, and said she was very bold; but he made no difficulties, and sent the things, and his wife retired with her dog to her room when we retired to ours, apparently without the least apprehension.

'When she came down in the morning, we were immediately struck at seeing her look very ill; and on inquiring if she too had been frightened, she said she had been awakened in the night by something moving in her room, and that, by the light of the night-lamp, she saw most distinctly a figure; and that the dog, which was very spirited, and flew at everything, never stirred, although she had endeavoured to make him. We saw clearly that she had been very much alarmed; and when Mr Atkins came, and endeavoured to dissipate the feeling, by persuading her that she might have dreamt it, she got quite angry. We could not help thinking that she had actually seen something; and my mother said, after she was gone, that though she could not bring herself to believe it was really a ghost, still she earnestly hoped that she might get out of the house without seeing this figure, which frightened people so much.

'We were now within three days of the one fixed for our removal; I had been taking a long ride, and being tired, had fallen asleep the moment I lay down; but in the middle of the night I was suddenly awakened—I cannot tell by what; for the step over our heads we had become so used to, that it no longer disturbed us. Well, I awoke. I had been lying with my face towards my mother, who was asleep beside me; and, as one usually does on awaking, I turned to the other side, where, the weather being warm, the curtain of the bed was undrawn, as it was also at the foot, and I saw, standing by a chest of drawers, which were betwixt me and the window, a thin, tall figure, in a loose powdering-gown, one arm resting on the drawers, and the face turned towards me. I saw it quite distinctly by the night-light, which burnt clearly: it was a long, thin, pale, young face, with, oh, such a melancholy expression as can never be effaced from my memory! I was certainly very much frightened; but my great horror was, lest my mother should awake and see the figure. I turned my head gently towards her, and heard her breathing high in a sound sleep. Just then the clock on the stairs struck four. I daresay it was nearly an hour before I ventured to look again; and when I did take courage to turn my eyes towards the drawers, there was nothing, yet I had not heard the slightest sound, though I had been listening with the greatest intensity.

'As you may suppose, I never closed my eyes again; and glad I was when Creswell knocked at the door, as she did every morning, for we always locked it, and it was my business to get out of bed and let her in. But on this occasion, instead of doing so, I called out, "Come in; the door is not fastened;" upon which she answered that it was, and I was obliged to get out of bed and admit her as usual.

'When I told my mother what had happened, she was very grateful to me for not wakening her, and commended me much for my resolution; but as she was always my first object, that was not to be wondered at. She, however, resolved not to risk another night in the house; and we got out of it that very day, after insti-

tuting, with the aid of the servants, a thorough search, with a view to ascertain if there was any possible means of getting into the rooms except by the usual modes of ingress; but our search was vain: none could be discovered.'

Mrs Crowe adds the remark—'Considering the number of people that were in the house, the fearlessness of the family, and their disinclination to believe in what is called the *supernatural*, together with the great interest the owner of this large and handsome residence must have had in discovering the trick, if there had been one, I think it is difficult to find any other explanation of this strange story, than that the sad and disappointed spirit of this poor, injured, and probably murdered boy, had never been disengaged from its earthly relations, to which regret for its frustrated hopes and violated rights still held it attached.'

The Germans have, like us, the mischievous racketing spirit, which they call *Pöllergeist*. Its peculiarity is, to make noises about the house, to cause crockery to fall from shelves and break, to throw stones through rooms, but only to fall at people's feet, and so forth. England furnished a noted case in the Stockwell ghost in the year 1772. Lately, the newspapers announced one in a house at Bayswater, near London. The best detailed, and, shall we say, best authenticated case on record, appears to be one which occurred at the castle of Prince Hohenloe, in Silesia, in 1806, when two gentlemen named Hahn and Kern were confined there. Here noises amounting to detonations were heard from neighbouring apartments; pieces of plaster were thrown at the two gentlemen; all the loose articles in the apartment flew wildly about; and lights darted during the night from every corner. M. Kern, looking in a mirror, saw a white female figure, with the face of an old person, bearing an aspect, not gloomy or morose, but rather of indifference. Hahn, who became a councillor, testified to these inexplicable events so lately as 1828. A curious appearance of verification is given to such things, when we learn that, in 1835, a case came before the sheriff of Edinburghshire, in which a gentleman who had leased a house at Trinity was prosecuted for damages he had done to it, by shooting pistols and knocking down pieces of wall, in order to detect the source of such a series of annoyances. The landlord considered the tenant's daughter, a sickly girl, who usually kept her bed, as the cause of the mischief; but all efforts at detection proved vain; and the girl did not long survive, 'hastened out of the world,' it is said, 'by the severe measures used while she was under suspicion.'

But we must now bring this subject to a close. We regret that want of space has forbidden us to enter so largely into the speculative part of the book as we could have wished. It contains many ingenious reasonings, which, if we could only admit the premises on which they proceed, seem as if they would lead us to some interesting knowledge respecting the ultimate destiny of man. The great question is as to these premises. 'Give us facts,' cry the Baconians; 'and when we have enough, we shall proceed to generalise.' 'Well, here are facts.' 'Oh, but these are false facts, for they do not accord with anything we have already ascertained.' It being undoubted that things may be thought to be facts which are none, most persons rest here satisfied. Others, who, like Mrs Crowe, bring forward new doctrines, resting on what they believe to be facts, complain, with some show of truth, that the modern philosophy lands them in a vicious circle, which puts a stop to all progress. It does not quite do this; but it certainly affords encouragement only to sciences strictly experimental, where probation is readily attainable. Where that is not the case, progress is undoubtedly much obstructed. Hence that ultra-physical character which our age has assumed, while all the speculative sciences are in a manner starved and dwarfed. It would be difficult to estimate in how great a degree this tells upon the moral tendencies of our time—how unspiritual

it makes us all. Studies like those in the 'Night Side of Nature' are in these circumstances welcome, if it were only as a means of making head against the materialism to which we are tending.

THE BASS ROCK.

THE Firth of Forth, as well as the Firth of Clyde, is signalised by an extraordinary rock, rising abruptly from the water's edge to a height of several hundred feet. Both have the appearance of a natural fortress guarding the gorge of the river, and both being unfit for the abiding-place of human beings, are tenanted by myriads of water-fowl, belonging in a special manner neither to the land nor the sea. The two, however, are different in their history and their fate—Ailsa being a mere adjunct of the grandly-beautiful picture presented by the Clyde, while the Bass is linked with the annals of Scotland, as well as associated with the dreams of her poets, and has now the honour to be the theme of a work produced by the united labours of five of her literati.*

In the preface to the work, Mr M'Crie, who acts as the editor, rallies good-naturedly himself and his colleagues on the limited dimensions of the ground selected for their operations; but we all know how much may be said—and well said too—about a very small matter. A tolerable enough little work has been produced by a French author descriptive of a tour round his room; and why should we not have this goodly volume, the achievement of five united intellects, touching a rock in the sea, fully a mile in circumference, and four hundred and twenty feet high?

The arrangement of the volume, however, is clearly wrong. It begins with the end of the sixth century of the vulgar era, then goes back to the pre-Adamite ages to tell in what manner the Bass came to be, then flies madly down to the epoch of the Solemn League and Covenant, then dallies with the solan geese on the summit, and finally tries to put nature out of countenance by cataloguing her parsimonious gifts in the way of lichens and weeds. In this paper we shall take the liberty of correcting so ill-considered a sequence of subjects, and begin with Mr Hugh Miller's account of the part played by the Bass in that grand spectacle—the creation of the present world.

'The ponderous column of the Bass,' says he, 'to sum up my theory in a few words, is composed, as has been shown, of one of the harder and more solid of the igneous rocks. Rising near the centre of the disturbed district in which it occurs, it indicates, I am inclined to hold, the place of a great crater, at one time filled to the top with molten matter, which, when the fires beneath burnt low, gradually and slowly consolidated into crystalline as it cooled, until it became the unyielding rock which we now find it. The tuffaceous matrix in which it had been moulded, exposed to the denuding agencies, wore piecemeal away; much even of the upper portion of the column itself may have disappeared; and what remains, rising from the level of the sea-bottom below to the height of six hundred feet, may be regarded as the capital-divested top of some pillar of the desert, that, buried by the drifting sand, exhibits but a comparatively small portion of its entire length over the surface, but descends deep into the interior, communicating with the very basement of the edifice to which it belongs.'

Wildly sweeps the great gulf stream round this remarkable eminence, and the ceaseless roll of the waves of the Atlantic, till, in the course of ages, the appointed rise or submergence of the neighbouring land is complete, and the Bass stands erect in the sea, a monument of an earlier world. What is its aspect now? 'The sun,' says

our author, standing on the ruins of Tantallon Castle, 'glanced bright on the deep green of the sea immediately beneath; and the reflection went dancing in the calm, in wavelets of light, athwart the shaded faces of the precipices; while a short mile beyond, the noble Bass loomed tall in the offing, half in light, half in shadow; and, dimly discerned through the slowly dissipating haze, in the background rose the rampart-like crags of the Isle of May. Nor was the framing of the picture, as surveyed through one of the shattered openings of the edifice, without its share of picturesque beauty; it consisted of fantastically-piled stone, moulded of old by the chisel, and now partially o'reshadowed by tufts of withered grass and half-faded wallflower.'

The Bass, it will be felt, was just the place for a hermit; and accordingly the first notice we have of the rock in modern times is its becoming the retirement of St Baldred, a Culdee presbyter, as Mr M'Crie opines, and no bishop, as others will have it. Thence the holy man sallied forth occasionally to teach the rude natives on the mainland the doctrines of Christianity; for 'in those days,' says Bede, 'people never came into a church but only for hearing the word and prayer. All the care of these doctors was to serve God, not the world—to feed souls, not their own bodies. Wherefore a religious habit was then much revered; and if any priest entered a village, incontinently all the people would assemble, being desirous to hear the word of life; for the priests did not go into villages upon any other occasion, except to preach, or visit the sick, or, in a word—to feed souls.' The earliest proprietors were the ancient family of the Lauders, a charter in favour of one of them dating as far back as 1316. In 1405, the Bass is first heard of as a 'strength,' or fortified place, when it afforded a temporary retreat to James, the son of Robert III., before embarking on that expedition which cost him nineteen years' captivity in England. The first prisoner received by the Bass was Walter Stewart, eldest son of Murdo, Duke of Albany, who was confined in its castle in 1424, while his father was sent to Caerlaverock Castle, and his mother to Tantallon. 'A lively fancy might draw an affecting picture of the old duchess, as she gazed from the opposite towers of Tantallon on the ocean prison that held her wayward son, and describe her feelings as she saw him conveyed away to suffer an ignominious death. But our Scottish ladies of that period were made of sterner stuff than we are apt to imagine. "There is a report current," says Buchanan, "although I do not find it mentioned by any historian, that the king sent the heads of her father, husband, and children to Isabella, on purpose to try whether so violent a woman, in a paroxysm of grief, as sometimes happens, might not betray the secrets of her soul; but she, though affected at the unexpected sight, used no intemperate expressions." I have an old manuscript, which records this piece of savage brutality, and adds that the old lady "said nothing, but that they worthwhile died, *gif that whilk wes laid against them were trew!*"'

The Bass remained a strength during the sixteenth century, and was visited in 1581 by James VI.; but here we must give a strange, wild theory of Hugh Miller, by way of an introduction to the sequel of its history. 'In passing the ancient castle of Dirleton, which, like the castles of Dunbar, Edinburgh, Stirling, and Dumbarton, owed its degree of impregnability as a stronghold mainly to its abrupt trap-rock, and which stood siege against the English in the days of Edward I., it occurred to me as not a little curious, that the early geological history of a district should so often seem typical of its subsequent civil history. If a country's geological history was very disturbed—if the trap-rocks broke out from below, and tilted up its strata in a thousand abrupt angles, steep precipices, and yawning chasms—the chance is as ten to one that there succeeded, when man came upon the scene, a history scarce less disturbed of fierce wars, protracted sieges, and desperate battles. The stormy morning,

* The Bass Rock: its Civil and Ecclesiastical History, by the Rev. James M'Crie; Geology, by Hugh Miller; Martyrology, by the Rev. James Anderson; Zoology, by Professor Fleming of the New College, Edinburgh; and Botany, by Professor Balfour of the University of Edinburgh. Edinburgh: Kennedy. 1848.

during which merely the angry elements contend, is succeeded in almost every instance by a stormy day, maddened by the turmoil of human passion. A moment's farther cogitation, while it greatly dissipated the mystery, served to show through what immense periods mere physical causes may continue to operate with moral effect; and how, in the purposes of Him who saw the end from the beginning, a scene of fiery confusion—of roaring waves and heaving earthquakes—of ascending hills and deepening valleys—may have been closely associated with the right development and ultimate dignity and happiness of the yet unborn moral agent of creation—responsible man. It is amid these centres of geologic disturbance—the natural strongholds of the earth—that the true battles of the race—the battles of civilisation and civil liberty—have been successfully maintained by handfuls of hardy men against the despot-led myriads of the plains. The reader, in glancing over a map of Europe and the countries adjacent, on which the mountain-groups are marked, will at once perceive that Greece and the Holy Land, Scotland and the Swiss cantons, formed centres of great Plutonic disturbance of this character. They had each their geologic tremors and perturbations—their protracted periods of eruption and earthquake—long ere their analogous civil history, with its ages of convulsion and revolution, in which man was the agent, had yet commenced its course. And, indirectly at least, the disturbed civil history was, in each instance, a consequence of the disturbed geologic one. What does our author make of the struggles of the Dutch and Flemings on land scarcely raised out of the sea? The whole matter comes to this, that trap-rocks, surviving denudation, and standing up as abrupt eminences, afford a place of defence to a handful of people against aggressive neighbours. Mr Miller's besetting fault is to make too much of simple ideas.

The Bass surrendered to Cromwell in 1651, and then changed hands more than once, till it was bought twenty years afterwards by government from Sir Andrew Ramsay, provost of Edinburgh, for £4000; 'and a dear bargain it was,' as Kirkton justly observes. This bargain was effected by Lauderdale, who so managed, that the command and profits of the rock, amounting to more than £100 sterling, were bestowed upon himself, together with the title of 'Captain of the Bass.' But,' adds Kirkton, 'the use the king made of it was, to make it a prison for the Presbyterian ministers; and some of them thought, when they died in the prison (as Mr John Blackadder did), they glorified God in the islands. But it became a rule of practice among that sort of people, whenever any of them was called before the council, that either they behaved to satisfy the bishop, which never one of them did, or else goe to the Bass; so all of them refused to appear; and our governors expected no more respect or obedience to their summonds.'

Forty of these godly men were confined in the Bass during periods varying from a few months to upwards of six years; and by far the greater part of the volume is occupied with their histories, generally obscure, and rarely interesting in the details. 'A slight survey,' says Mr Mc-Crie, 'of the ruins of the fortress, as they now stand in naked desolation, is sufficient to corroborate the testimonies of the prisoners, and to show that they had little reason to congratulate themselves on the selection of their marine prison-house. Placed near the base of the overhanging precipice, it must have formed a sort of tank or reservoir for the perpetual drippings from above, while it was washed by the spray from the ocean below, and entitled by exposure to the full benefit of the eastern blasts. What is still pointed out by some as "Blackadder's cell," is a dormitory about seven feet by eight, situated on the ramparts, with a small window facing the south. If so, he was better appointed than his brethren in the inner prison, the remains of which, though unroofed and unfloored, may be still traced. On a late visit to the ruins, I was struck by observing that

in the western gable of this room is one small window which had served for light, but which is placed at such a height above the floor, that the prisoners could see neither earth nor sky from it; while in the eastern gable there is another window placed at a lower elevation, but so contrived, that it had looked only into a narrow passage, formed by a wall built up against it, and enlightened by a higher aperture in that wall. By this piece of ingenious cruelty, the poor prisoners within would be furnished with a dim and borrowed light, and at the same time prevented from beguiling their captivity by gazing "on mountain, tower, or town," or even on that heaven to which all their hopes were turned, and the straggling beams of which were so scantily afforded them. At the same time the sentries or keepers might at any time, by creeping along this passage, manage, through the inner grating, to observe the movements, and hear the conversations, of their prisoners. There can be no question regarding "the lowest cell in the dungeon," to which Thomas Hog of Kiltarn was consigned, through the tender mercies of Archbishop Sharp. An arched staircase, part of which still remains, leads down under ground from the east end of the castle, to what was anciently called the Bastion, on arriving at which the visitor finds himself in a hideous cavern, arched overhead, dank and dripping, with an opening towards the sea, which dashes within a few feet below. It was in this "horrible pit," then—obviously the "dungeon-keep" of the old castle in the days of its glory—that the good man was deposited; and no wonder that, when his enfeebled frame was dragged down that subterranean passage, and stretched in this dismal den, he should have concluded that his enemies had done their worst—had reached the end of their chain—and that the deepening darkness of the night betokened the near approach of the dawn.' This passage is well coloured; but the impression laid by the plainer and more prosaic narrative of Mr Anderson is not quite so painful. Indeed in one instance, an air approaching to the ridiculous is thrown over the complaints of the prisoners, by their including the grievance of being obliged to drink the governor's twopenny ale, which was in reality worth no more than a halfpenny! Their brethren of the present day would have liked the ale the better in proportion to its scarcity of malt. In the case of a fine, high-hearted minister, Thomas Hog, the hardships of the rock appear to have acted with medicinal virtue. His rule was the self-denunciation of Scripture—'Wo unto me if I preach not the gospel!' And because he would come under no promise to refrain from what he conceived to be a sacred duty, he was sent to the Bass. 'When the act of council was communicated to the good man, he raised himself up with some difficulty in his bed to read it; and on learning its import, feeling that to subject him to the hardships of such a confinement, in his present state of health, was almost equivalent to signing his death-warrant, he said it was as severe as if Satan himself had penned it. In execution of the sentence, he was carried down to a low filthy dungeon; and to all appearance his speedy death was inevitable. But when he found no mercy at the hands of man, he looked by faith and prayer to Him "who hears the groaning of the prisoner;" and to the wonder of all, he in a short time completely recovered. Hog never afterwards showed any resentment at Sharp for this savage treatment, but when speaking of him, used to say merrily, "Commend him to me for a good physician!"'

The zoological department of the work is of course chiefly devoted to the solan goose, which has other breeding places as well as our own coasts—namely, the most westerly of the Faroe group, some rocky islands in the bay of St Lawrence, and the coast of Labrador. Boece ridicules the theory of the birth of these birds current in his time, that they grew upon trees like apples, and supplies its place with another of his own, that they were produced by the corruption of the fruit or branch. 'Furthermore, because the rude and igno-

rant people saw oftentimes the fruits that fell from *trées*, which stood neuer in the sea, conuerted within short time into *gêese*, they belêued that these *gêese* grew vpon *trées*, hanging by their nebs, as apples and other fruit doo by their stalks, but their opinion is vtterlie to be reiected. For so soone as these apples or fruit fall from the *trée* into the sea, they grow first to be worm-eaten, and in process of time to be conuerted into *gêese*! All this the intelligent reader will perceive refers to the absurd but once prevalent notion, that the common barnacle of our coasts possessed the wonderful faculty of changing into a goose. The fruit-like aspect of the shell, its flexible foot-stalk, and the long feathery filaments (*cirri*) of the animal, gave rise, no doubt, to this extravagant hypothesis. The barnacle's habit of attaching itself to pieces of timber, decayed and pierced by marine borers, is that to which Boeetius alludes in the conclusion of his explanation.

The botanical chapter, although necessarily meagre, has a few readable paragraphs, for which we have no room.

In conclusion, the result of this quintuple alliance, although a little too sectarian to suit our feelings, is, upon the whole, a pleasant and readable book, which we recommend to all who have hitherto looked upon the Bass as a mere rock in the sea—a point of scenic effect in the panorama of the Firth of Forth.

POPULAR EDUCATION.

On the occasion of lately laying the foundation-stone of a training college near Caermarthen, the bishop of the diocese made the following eloquent observations on the necessity for popular education:—'It is mortifying for every one who has a proper feeling for the honour of his country, to consider that the surrounding nations of Europe are in advance of England in the matter of popular education. The necessity and importance of popular education has been practically recognised and acted on by them before it has been acknowledged by us. This is an acknowledgment that no Englishman, who has a proper sense of the honour of his country, can make without a feeling of degradation and shame. It would be well, however, if nothing else was affected but the honour of his country. The very safety of the nation is dependent upon popular education. We may try to mask the fact from ourselves, but it has been found from experience and the common information of intelligent judges—in fact all persons are agreed that the present state of things is full of danger to the community at large. I will not rely on any argument as to the mere consideration of the expediency of educating the children of the poor, but I consider it a solemn duty which we owe to the people of this country, and if that duty remains unperformed, there cannot but be danger which ought not to be overlooked. We cannot shut our eyes to the fact, that every neglect of a plain duty must be attended with danger, and the signs and symptoms of this danger are every day more and more apparent. The statistics of population, education, and crime sufficiently attest it. We have sufficient evidence of an immense population growing up, with no sense of duty, no restraint upon their passions, with their intellectual qualities not cultivated, and with no rational and religious sense of their duty towards each other or their Maker. What, therefore, are we doing? We are collecting the materials for a dreadful explosion which will shake society to its foundations. Those who are living in opulence and ease are not aware of this. They may be forming plans for future enjoyment, and revelling in the prospects of national prosperity; but they ought to know that, while they are planting vineyards on their hills, they are, in fact, standing on the sides of a volcano, which is heaving and trembling, and may at any moment open and let out a flood which will overwhelm all our social and national institutions. The symptoms of the laborious throes of society cannot but be perceptible to every thoughtful observer. Let us look nearer home, and see if the scenes which surround us are of a more encouraging character. I fear that it will be entirely the reverse. In speaking of the condition of our own population, every inquiry leads to this conclusion—that the deficiency of education in Wales is even greater than in the rest of the country. I am afraid our moral condition is just such as we might expect from the deficiency in popular education.'

I will not make a catalogue of the vices prevalent in the principality, but I cannot omit noticing one, which is a fruitful parent of all crime, and bears every description of evil in its train. I mean the vice of drunkenness; and it does appear from authentic information, that in this country that vice is rapidly on the increase. It thereby appears that whatever improvement is required elsewhere, it will be doubly necessary here. What is the remedy? What the safeguard from this danger? I will answer, Education—popular education.'

SONNET.

[BY CALDER CAMPBELL.]

It doth surpass belief how some—accounted
Wise in their generation—with strange skill
Prove there's more merit in concealing ill
Than in discovering good. The ape, tree-mounted,
Is an apt teacher of such lore; and still
Seeketh to hide his stolen trash, and fill
His secret stores with plunder. Oh could we
Use our intelligence Truth to discover,
Rather than fashion mantles to fling over
Our errors! 'twere an exercise to be
Rewarded in the future plentifully;
And in the present, making nature's lover
Acquainted with such joys as ne'er can rest
In the dark mazes of an artful breast!

LONDON, 1848.

NATURAL USES OF HAIR.

That hair effects an important purpose in the animal economy, we have evidence in its almost universal distribution among the mammiferous class of animals; and if we admit the analogy between the feather and the hair among all warm-blooded animals, additional evidence is obtained in the perfection of its structure, and again in its early appearance in the progress of development of the young. As a bad conductor of heat, it tends to preserve the warmth of the body; and in man it would have that effect upon the head, and serve to equalise the temperature of the brain. It is also a medium of defence against external irritants, as the heat of the sun's rays and the bites of insects, and against injuries inflicted with violence. Of special purposes fulfilled by the hairs, we have instances in the eyebrows and eyelids, which are beautifully adapted for the defence of the organs of vision; in the small hairs which grow in the apertures of the nostrils, and serve as guardians to the delicate membrane of the nose; and in similar hairs in the ear-tubes, which defend those cavities from the intrusion of insects.—*Wilson on the Skin*.

TIMBER MINING IN AMERICA.

On the north side of Maurice Creek, New Jersey, the meadows and cedar swamps, as far up as the fast land, are filled with buried cedars to an unknown depth. In 1814 or 1815, an attempt was made to sink a well curb near Dennis Creek landing; but after encountering much difficulty in cutting through a number of logs, the workmen were at last compelled to give up the attempt, by finding, at the depth of twenty feet, a compact mass of cedar logs. It is a constant business near Dennis Creek to 'mine cedar shingles.' This is done by probing the soft mud of the swamps with poles, for the purpose of discovering buried cedar timber; and when a log is found, the mud is cleared off, the log cut up into proper lengths with a long one-handed saw, and these lengths split up into shingles, and carried out of the swamp ready for sale. This kind of work gives constant employment to a large number of hands. The trees found are from four to five feet in diameter—they lie in every possible position, and some of them seem to have been buried for centuries. Thus stumps of trees which have grown to a greater age, and have been decaying a century, are found standing in the place in which they grew, while the trunks of very aged cedars are lying horizontally under their roots.—*Scientific American*.

PRICE 1½d.

THE HIGHWAY OF THOUGHT.

THIS establishment, situated in the very focus of metropolitan business, promises to become of national importance. In the immediate vicinity of the Bank of England, Royal Exchange, and other great centres of city affairs, it affords facilities for the acquisition and transmission of commercial and other intelligence, of which but a feeble estimate can as yet be formed. By means of it a merchant may learn the arrival of a cargo at one of the outports in time for an advantageous sale, or he may send down orders to sell goods or detain a vessel as circumstances require, while brokers and bankers may become acquainted with the fluctuations in the value of stocks all over the kingdom at the very instant of their occurrence, without waiting for the next day's post.

After what has already appeared on the subject in the Journal, we presume our readers sufficiently acquainted with its scientific details. In the present paper, we shall therefore confine ourselves to a few points connected with the economy and management of this new element of progress, which has been not inappropriately called 'the highway of thought.' The establishment in question is a new building expressly erected at the end of a narrow court running out of Lobbury, and in this situation affords but little external evidence of the important operations carried on within. Entering from the court, the visitor finds himself in an elegant and moderately-sized hall open to the roof, which consists of an ornamental skylight in compartments. Ranges of columns, supporting open galleries running round each side of the interior, rise one above another to the upper storey. The east and west galleries contain the 'instrument rooms' and printing department, the others are merely passages of communication. There is an air of business about the place—messengers arrive and depart—clerks are on the alert—from time to time the sudden *kling* of a bell announces that a message is on its way to one of the attendants above, for transmission to the locality under his charge. Behind the rows of columns on the ground-floor is a counter, with clerks in attendance: the eastern side is reserved for the telegraphs communicating with all parts south and east of London, and the western side for those to the north and west: this distinction, which presents many advantages, is kept up throughout. On the glazed partition behind each counter is a list of the names of places with which that side is in connection, so that a person on business can at once address himself to the proper quarter.

The wires from the various stations are brought into the building in the basement floor, where they may be seen terminating in a horizontal row of eighty-one small brass knobs. These wires are laid in tubes under

the surface of the streets, in the same way as gas and water pipes. There are nine of these tubes, with nine wires in each, making a total of eighty-one, corresponding to the number of knobs in which they terminate. The whole of these are not employed at once, but are provided as a reserve in case of accident to those actually in use, the number of which is twenty-six. Three of the tubes are connected with the North-Western or Birmingham station; one each with the South-Western, and South and North-Eastern, and the Company's office in the Strand; two others, which are spare tubes, communicate with the first two lines above enumerated. The wires, as they come in from each station, are numbered 1 to 9, 1 to 18, &c. according to the quantity; and about nine inches below the knobs in which they terminate is a similar row of knobs, to which are attached the wires from all the instruments in the building. These are numbered consecutively from 1 to 81, for facility of reference, and are termed the 'house wires,' the upper row being the 'line wires;' and wherever the wires terminate, in any part of the house, a corresponding number is affixed. Thus, supposing a clerk up stairs finds a difficulty in transmitting a message, he sends down to say that wires 30 and 31 are at fault somewhere. On looking at these numbers in the basement, they are found connected with numbers 7 and 8 of the Southampton line; and as it is of importance to avoid delay, and the continual digging up of the streets to find the defect, the connections may immediately be shifted to numbers 3 and 4, or 5 and 6, of the same line. The two battery-rooms are also on the basement floor, one for each side of the house, presenting the same arrangement of numbers, with the addition of a distinct number to each battery. If, on searching for defective wires, they are not found within the tubes carried through the streets, another portion of the apparatus is then brought into play, which at once points out the line of railway in which the fault will be found. A most perfect system of checks, in fact, is kept up throughout the establishment.

On mounting to the 'instrument galleries,' the 'house wires,' which are brought up from below through a shaft in the wall, are seen stretched in parallel lines immediately under the ceilings. They are all made to range east and west, to distinguish them from the 'line wires,' which are placed north and south. Each one shows a number at its termination, thus affording, as before explained, the readiest means of detecting defects. Two dials or instruments are generally placed at each desk; one of these may probably communicate only with the station in Shoreditch, while the other may be in connection with Peterborough, or some other remote locality. Each one is watched by a clerk, who, in the intervals of occupation, employs himself in reading: the book lies on the desk before him, and the click

of the needles, whenever they are set in motion, is at once sufficient to attract his attention: the telegraph bells, to avoid unnecessary noise and confusion, are not 'on' in the day-time. We were much gratified to learn that, as soon as the more pressing business details are completed, the Company intend to establish a library for the use of the clerks, whose time in the intervals of telegraphing would otherwise be wearisome and altogether lost. One portion of a gallery is set apart for the especial use of the Admiralty, who by this means may communicate with any of the outposts. They have, besides, an office in their building in Whitehall, connected only with Portsmouth. This is supplied with clerks, &c. by the Company, who perform this service, and keep the wires on the line in repair, for £1200 a year, paid by the government. The clerk at the South-Western instrument was on the alert at the time of our visit: a mail was expected at Southampton, and the signal was looked for every instant. 'Ask if it has arrived,' said the manager, who stood by; and almost as soon as the words could be spoken, came back the answer, 'Not yet.' Notwithstanding this was but an effect of a natural cause, there was something singularly impressive, bordering on the marvellous, in the contemplation of this instantaneous transmission of thoughts.

Rapid as this communication is, it will be obvious that the delivery of a long message, letter by letter, will in the end be tedious. This inconvenience is remedied by the telegraphic printing machine, the principle of which, due to Mr Davy of the Strand, has been adapted to the process by Mr Bain. This machinery is fixed in the upper western gallery; but without diagrams, it is scarcely possible to convey an idea of its nature. It may be sufficient to state that certain wires are brought into combination with an arrangement of wheels, which give motion to a cylinder. A similar combination is supposed to exist at the other extremities of the wires at any distance: one wire only is required for the printing between any two places. The cylinder revolves on an endless screw of twenty-four threads to the inch; it is nearly a foot in diameter, and is covered with paper tinged pale green with sulphate of copper. A lever, to the extremity of which is attached a tongue of steel, or spring, delicate as a needle, is contrived so that the point may rest on the paper when required. Suppose, for example, the message sent from Derby: the arrangements being completed, contact is made, the machinery set to work, and the green paper round the cylinder, where it is pressed by the delicate spring above alluded to, immediately becomes marked by a series of dots and dashes (· — · — ·) of a dark-green colour, in lines whose distance is proportionate to the threads of the screw on which the cylinder revolves, twenty-four to the inch. The symbolic characters represent the letters of the alphabet, and are printed at the rate of a thousand a minute. In this way a column of the 'Times' may be rapidly worked off: as soon as an inch of the paper is covered, it can be detached by means of a cutting blade attached to the lever, and transcribed in ordinary writing.

The process by which the message or other document is communicated to the prepared paper is ingenious and interesting. It must first be stamped or punched through a narrow strip of paper, which, when rolled up, resembles a flat coil of tape. The punching tool, about a sixteenth of an inch diameter, is inserted in a holder moved by a spring, which rises immediately after being pressed. The coil of paper being placed so

as to revolve, the clerk takes the end, and pulling it gradually along under the punch, cuts out each individual letter of the message in its corresponding symbol or hieroglyph with great rapidity. The coil is re-wound, and when full, this portion is ready for transmission. It is affixed to the machinery before spoken of, and as it unwinds, a spring presses it down upon a metallic surface, with which contact is made every time that a hole-dot or dash passes, and broken when the spring presses only upon the intervening portion of the paper. This alternate making and breaking of contact is instantly transferred in smaller but corresponding characters to the paper on the cylinder at the place to which the message is being sent, although five hundred miles distant. Effectual as this process may appear, it can be regarded only as a step in progress. Time and experience will bring about great improvements in electric telegraphs, among which we shall doubtless see printing in the ordinary character, without the preliminary trouble of punching.

The charge for transmitting a message of twenty words is—to Cambridge, 4s. 6d.; Southampton, 5s. 6d.; Gosport, 6s. 6d.; Liverpool and Manchester, 8s. 6d.; Edinburgh, 427 miles, 13s. For forty words, the charge is nearly double; and so on in proportion. On the presentation of a message at one of the counters, after the usual business preliminaries, it is handed through to the 'Translating Office.' A merchant on 'Change sends to ask if his ship is in at Liverpool: the question may be, 'Has the Cleopatra arrived?' This is not spelt in the ordinary way, but is much shortened, by making use of a code of private signals drawn up by the Company. The answer comes back in the same form, and is then translated or written out at length, and passed through to the outer office. The clerks in the galleries are notified of the entry of a message by the stroke of a bell, and the document is conveyed to them and sent down again by a *lift*. At present, the sending of a message to Edinburgh occupies thirty minutes, in consequence of a break in the line at Newcastle, where it is carried by hand across the Tyne a mile and a half. When this interval is filled up, the communication will be, as in other cases, instantaneous.

As yet, the South-Eastern or Dover station, though it has a telegraphic office within itself, is unconnected with the central establishment; with all the other metropolitan stations the connection is complete. The cost per mile for fixing two wires along a railway is £70. This includes a patent-right charge of £20 per mile; but the expense diminishes in proportion to the number of wires, as one series of posts will do as well for six as two: for four wires, the cost would be £120. A ton of wire will extend four miles. Among improvements, that of a more perfect method of insulation is greatly desiderated, not only of the railway wires, but of those in the tubes underground. The latter are wound round with cotton, and covered with a mixture of glue and pitch. The envelope is, however, liable to fracture; and if the wires come into contact in any part of their length, the conducting power is immediately suspended. The Company pay £25 a year to the Waterloo Bridge proprietors for the privilege of carrying their tube across the edifice. The excavation and laying down of the tubes through the streets costs £450 per mile. With this is associated a singular charge by the Paving Commissioners of 1s. 6d. per yard for repairing, although the whole of the work is done by the party opening the street: it may probably be a fee for the trouble of inspection.

The Company's patent is for a period of fourteen years; at the expiration of which, should it not be renewed, they will naturally be exposed to competition. Other adventurers will be bidding for permission to establish competing lines along the rails. But the present parties will, of necessity, retain the control for a

long time, especially as the L.20 patent-right will no longer be essential. Taking the whole of their establishments throughout the country, they have about one thousand persons in their service, inclusive of one hundred and twenty men continually employed in the manufacture of apparatus. The mere repairs, to say nothing of increased demand, will always require a large and competent staff of workmen.

Hitherto, the number of paid messages transmitted daily from the Central Office has been from fifteen to twenty: this department is one which in time will be most extensively developed. Lloyd's establishment will avail themselves of it; and for a payment of two guineas annually, any one may make use of the Company's Subscription Rooms in any part of the kingdom, with a set of private signals for the transmission of ship and share lists, prices current, reports of corn markets, &c. The telegraphs for commercial messages are quite independent of those in the service of the railway companies. Sixty places, including the chief ports and towns of the country, are at the present time in telegraphic connection with the Central Office.

The Company do not undertake to be responsible for accidental delay in the transmission of a message, nor for errors in delivery, beyond the sum of L.5. They recommend customers on all occasions to have the message repeated, in which case they are responsible. The charge for repetition is one-half of the first cost. Correct delivery of 'money messages' may be insured at the rate of 2s. 6d. per cent. Many of these charges will doubtless undergo revision and modification when all the arrangements shall be completed.

Our acknowledgments are due to Mr Holmes, general manager of the works and apparatus, for his explanations during our visit, and the facilities he afforded for minute inspection of every part of the establishment.

FORTUNE-SEEKERS AND FORTUNE-MAKERS.

A TALE.

BY ANNA MARIA SARGENT.

'WHERE'S Fred this evening?' inquired Francis Bolton, putting his head in at the half-open door of the little parlour behind a grocer's shop in one of the leading thoroughfares of London. The query was addressed to a young but pale and careworn-looking matron, who was bending over an infant, hushing it to rest, whilst four older children, of various ages, were gambolling at her feet.

'He's just gone out with Mr Hawkins,' was the reply, and a suppressed sigh accompanied the words.

'What! left his business on a Saturday night?' interrogated the visitor, who was the brother of the shopkeeper. 'It is surely some matter of importance that has taken him out then?' These observations were intended to call forth an answer; but the wife only looked up, and shook her head mournfully.

The visitor now entered the apartment, and sat down by her side. He affectionately patted the head of a rosy boy of seven; playfully discomposed the flaxen ringlets of a smiling girl of five; took a younger one in his lap; and bade the other play at ball or hide-and-seek for his amusement. 'My dear Mrs Bolton,' he then said in an anxious and somewhat agitated tone, 'you must use your influence to prevent this close intimacy between Hawkins and your husband, or it will be Alfred's ruin.' Another sigh escaped the lips of the young matron. It was a sigh which said, 'My influence is not so great as it was eight years ago;' but still she spoke not. 'He's an idle, dissolute fellow, I assure you,' her companion pursued; 'one of those fellows who live upon their wits. His convivial spirit makes him attractive amongst a certain class of persons; but he's a dangerous acquaintance, especially to one of Fred's irresponsible character.'

'I am too well aware of that,' the wife now made answer; 'yet nothing I can say will induce Alfred to

think so. Would it not be well for you to speak to him on the subject?' she asked.

'My interference, unhappily, would answer no good purpose, Susan. Fred thinks that, because he is older than I am, I have no right to counsel him, and he is only angry if I attempt it.'

The dialogue was here interrupted by the apprentice calling out from the shop, 'Will master be in soon, ma'am?' And Mrs Bolton, looking through the still half-open door, perceived that the counter was thronged with customers.

'I must go and assist John. I am sure you will excuse my leaving you so abruptly,' she quietly said, depositing her precious charge, which she had by this time lulled to repose, in the little cot which swung by her side. 'Have you any message for your brother?' she asked, as she moved towards the door; adding, 'I cannot press you to wait with the expectation of seeing him; I know you are anxious to get home to your family.'

'I very much wished to see him, and I thought I should be sure to find him at home to-night,' Francis returned.

'I'll tell him then that you called.'

'Tell him also that it is the 19th day of the month; he will understand you.' The wife faintly smiled an assent, and retreated.

'Don't go yet, Uncle Frank,' cried the eldest boy, running up and clasping the young man's knees; 'stop and have a game with us first. Father used to play with us sometimes, but now he is always out.'

'Always out?'

'Yes, uncle, he's always out after tea; and I'm at school all day, so he can never play with us.'

'When he went out to-night, mother cried,' chimed in the little girl, and her own bright eyes were overflowing with tears as she spoke. 'She said, "Don't go, don't go," to father so many times, that he was angry with her, and so cross to us.'

'Poor children!' the visitor soliloquised, 'your condition is, I fear, more unhappy than your young hearts conceive. I can't stay to-night, my dears,' he kindly said, caressing them by turns; then looking tenderly at the unconscious infant, as he slept peacefully in his little bed, he darted through the shop, nodding affectionately to his gentle sister-in-law as he passed.

We will now introduce the reader to a similar apartment, in which another family group were assembled. This difference, however, existed: the countenance of the fair young matron was the personification of peace and happiness, and the entrance of Francis Bolton was the signal for a burst of delight.

'I am late this evening, but I hope you have not been anxious, dearest Letty!' the husband exclaimed, as he tenderly saluted his wife. 'When I left home in the morning, I was not aware that business would call me to my brother's.'

'Oh I was not afraid that you were spending your week's earnings at a tavern,' she playfully made answer. The young man sighed. 'Why, my dear Frank, you look as grave as if you had really been guilty of the thing. Ha! have I surmised aright?' and she looked up with a smile which contradicted her words.

'No, my love; but I will tell you when we are alone what it is which causes my gravity. Now give the baby to me, and go to market;' and as he spoke, he took the infant from her arms, and threw a handful of silver into her lap. 'Be economical to-night, Letty,' he whispered, as she proceeded to equip herself in her bonnet and cloak.

'Am I not always economical?' the wife inquired.

'Yes, my love; I've no cause for complaint on that score; but I wish you to be more than usually so; I'll tell you why when you return.'

'Nay, tell me now, dear Frank; pray don't keep me in suspense. I fear there is something the matter.'

'No, no—nothing serious, my dear; don't be alarmed; it's only a trifling loss, which we must redeem by prac-

tising a little self-denial. Perhaps,' he added, with a forced laugh — 'perhaps it is a *happy* event, for it may teach me to be more cautious.'

'You have been called upon to pay the bill you accepted for your brother,' she gently said.

'Even so. It is the first time I ever did such a thing, and depend upon it, Letty, it is the *last* I will put my hand to.'

'But you thought to serve your brother, so you must not reflect upon yourself, dear Frank,' she soothingly observed.

'I did; but I now see that I shall impoverish my own family without materially benefiting him; and this I do not think it right to do, even for a brother.' The wife made no further comment; but when she returned with the provision for the week's consumption, it was obvious that she had borne her husband's injunction in mind.

Ere the evening was over, the quietude of the little family was broken in upon by the entrance of Alfred Bolton, who, elated with some information he had just received, and half inebriated with the copious potations of ale which he had drunk, saluted his brother with a blow on the shoulder, which made him shrink to a little distance.

'I've excellent news for you, my boy—excellent news!' he began: 'so let's have a glass over it.'

'You know, Fred, that I belong to the Total Abstinence Society,' Francis replied.

'Oh, I forgot that. Then I suppose,' he sneeringly added, 'you wouldn't treat a friend, or even a brother, with a glass, and so you save your pocket and quiet your conscience at the same time.'

'You are quite right, Fred; I do most certainly save my pocket and quiet my conscience; but my principal motive in joining that society was, that I might set an example to others.'

'And have you found the plan answer?' Alfred laughingly inquired.

'I have. I hope I have been the means of rescuing two or three families from the sin in which drunkenness is sure to involve them, and I yet hope to exert similar influence over many more.'

'You'll never bring me to sign my name to such a pledge!' Alfred interrupted him by exclaiming. 'But we'll drop this subject; we shall never agree upon it; and I've something more interesting to talk about.'

'I hope the good news you have to communicate is, that you will be able to refund the money I paid for you to-day?' Francis gravely remarked.

'Oh I shall be able to pay that and every other debt in a very short time.'

'From what source, pray?'

'Why, I have a fortune in view.'

'Not from the profits of your business, if you leave it, as you are now doing, on a Saturday night.'

'No, I shall never get a fortune by shopkeeping, that's sure. I wasn't cut out for it. I was born to spend a fortune, not to make one.'

'But you must make it before you can spend it.'

'Not if it's ready-made for me.'

'I don't understand what you mean by all this, Fred; and, to own the truth, I am rather anxious to know what good prospect you have of refunding this money, for I have been obliged to draw upon a little reserve I had made for a specific object in order to settle the bill.'

'Oh, you must wait a few weeks—only a few weeks, and then you'll see me driving my phaeton.'

'More likely that I shall see you in a prison.'

'You are very fond of prophesying a prison for me, Frank. I can't say that I think it altogether brotherly. However, time will prove which of us is in the right.'

'The tradesman who leaves his business to his wife and his apprentice, and spends his Saturday night at a tavern, is on the high road to a prison, or I'm very much mistaken,' Francis remarked.

'That visit to the White Lion to-night was the most

lucky thing that ever happened to me,' the young man returned. 'And now I'll tell you all about it. What should I see there but an advertisement for one Alfred Bolton, the nephew of the late Captain Thomas Bolton of the Royal Marines, with the information that a large sum of money, willed to him by the said captain, lay in the hands of the executors of the deceased!'

'And is that the only ground for your great expectations?'

'Only ground! Why, I think that is enough. You know, Frank, that father used to talk about a brother Tom, who ran away from home when a youth, and it was supposed took to a seafaring life. Well, there can't be a doubt that this is the very man.'

'I don't agree with you in concluding that there can't be a doubt. The names are common.'

'True; but the coincidence of names and profession is singular. I am quite satisfied that I am the person.'

'Well, if you can make the executors as well satisfied, it will be a good thing; but I'm not so sanguine.'

'And I suppose you'd have me say, "Oh, it's no use trying," and go plodding on behind my counter without attempting to better myself.'

'No, Fred, that is not my advice. I would have you apply by all means; but at the same time I would not have you suffer yourself to be so elated with the expectation that a disappointment would greatly depress you; nor would I see you neglecting one of your *positive* duties in the pursuit of an *uncertain* good.'

'That's just like you, Frank.'

'Is it not common sense and prudence?'

'Well, well; call it what you like. Now I'll go home, and tell the news to Suky.'

'Poor Susan!' his brother responded, 'she looks very pale and ill. I fear she is suffering from the double duty you impose upon her.'

'Oh, she shall ride in her carriage soon. Good-by, good-by; and the visitor made an exit as abrupt as his entrance had been.

The notion that a fortune was only awaiting his putting forth his hand to take it having once got possession of the mind of Alfred Bolton, he took no further interest in his business. The shop he occupied had been established for more than thirty years. His father had brought up a large family in respectability from its profits, and industry and perseverance would have insured the same success to him. His natural indolence was, however, encouraged by the society he made choice of, which, together with his weakness of mind and unstable principles, led to the most unhappy results. The connections which commenced with an occasional visit to the tavern, proceeded in time to positive intemperance; and Bolton now seldom returned to his distressed family until in a state of intoxication. Poor Susan did all in her power to keep the connection together: she strove to supply her husband's place in the shop, though she was necessarily obliged to neglect her children, and sacrifice the domestic comfort of their home. The apprentice, taking advantage of his master's inattention to business, and thinking that a woman had no right to assume the authority, became remiss in his duties. He transgressed the rules of the house with impunity, and at last became so daring in his resistance of control, that Mrs Bolton, though with great reluctance, was obliged to lodge complaints against him to her husband. The remonstrances of an idle and intemperate master could not, however, be expected to have much effect upon the youth. He defied his power, and still persisted in the same practices.

Such a state of things could not long continue. The wholesale dealers with whom Bolton transacted his business sent in their bills at the usual time; but there was no money to meet their demands. The principal as well as the profits had been expended in endeavours to obtain documents, which, after all, proved to be useless, and in libations at the tavern to drown care and stifle the stings of conscience.

To add to the troubles from which the family were suffering, an epidemic which was raging in the neighbourhood seized the younger branches, and one after another was attacked. Fears were entertained that they would fall victims to the disease, and this new calamity called forth all the mother's feelings. She could now no longer fill her husband's place, and the business, in its turn, gave way to these pressing duties.

Mrs Bolton was, late one evening, sitting with the youngest of her children in her arms, expecting every hour would terminate his life, when her husband's brother entered the same little parlour to which we introduced the reader at the commencement of our narrative. He did not now, however, inquire, as before, for Alfred, but seating himself in silence by the side of the weeping mother, cast on her a compassionate and sympathising glance. 'I am sent to you by your husband, my dear Mrs Bolton,' he at length said, bending as he spoke over the sick child, in order to conceal his emotion.

'By Alfred?' she inquired. 'What is the matter? Is he ill?'

'No, not ill; but he will not be able to see you to-night.'

A gleam of the truth crossed the mind of the unhappy wife, but no burst of agony escaped her. She had grown familiar with misfortune, and this fresh disaster was only what she had for some weeks anticipated.

'He is in a prison,' she said in that hollow tone bespeaking a depth of distress which cannot vent itself in tears or expressions of anguish. 'I guess it all too well—I have long foreseen this termination.'

'And so have I, dear Susan,' Francis affectionately returned; 'but that has not softened the blow. It has distressed me and Letty beyond measure to see you and your innocent children suffering from the misconduct of my foolish brother. Say, however, what we can do to serve you?'

'You are very kind,' the wife returned, whilst a smile for an instant illumined her pale, careworn features—'you are very kind; but I cannot ask you to provide my children with that support which their father might earn for them. Things must now shortly come to a climax, and then, if it is the will of Providence that they should be spared, I will work for them with my own hands.'

'But you are ill, and unequal to any further exertion.'

'You know not what a mother can do for her offspring,' she energetically made answer.

That night, in the gloom and solitude of a home which had once been the abode of happiness—a home from which she expected shortly to be driven—Susan Bolton closed the eyes of her youngest-born.

It may be here necessary to inform the reader that Alfred Bolton's claim to the advertised property had not been acknowledged by the executors of the deceased captain. Several other candidates had come forward with him. These had, however, been alike unsuccessful in proving their identity; and this circumstance had strengthened Bolton in his conviction that he was the person to whom it really belonged. He protested that the executors were a set of rogues, who had resolved to keep the money in their own hands; and neither the gloom of his prison-home, the prospect of insolvency, nor the destitution of his family, could daunt his hopes of one day being master of the disputed wealth. He was resolved, he said, when once again at large, to prosecute the knaves who were endeavouring to rob him of his right; and vain were poor Susan's tears and prayers that he would drop all thoughts of the unfortunate business, and turn his energies to the settlement of his own affairs.

Francis was equally urgent on the subject; and though it was by his generous aid alone that the family were saved from starvation, his brother would not listen to his counsel.

'Alfred,' he said to him one evening as he sat at

the window of his room overlooking his fellow-debtors, who were amusing themselves with the monotonous prison games in the court below. 'I hope you have now seen the fallacy of pursuing a shadow, and, by so doing, losing the substance. You must be aware that, but for the expectation you had of that property, and the consequent neglect of your shop, you might have been still in your snug little parlour instead of this miserable abode.'

'You are wrong in terming it a shadow, Frank,' his brother interposed. 'The money is as surely mine as that I sit upon this seat; and I shall yet be able to prove that it is so.'

'If that is your determination,' the younger Bolton returned, 'I have no hope for your future prospects.'

'But what am I to do?' Alfred impatiently asked. 'I shall have neither money nor credit to begin the world again with. Am I to see my family die of starvation, and then throw myself into the river?'

'You know that I advocate neither apathy nor despair,' his brother returned. 'I would see you exert your energies, but then they should be directed in the right course. Your best way will be, on your release from confinement, to take some situation in the line of business to which you have been accustomed.'

'What! I who have been a master for these ten years become a servant! No, Frank, I will be no man's slave!'

'You are the slave of your own false pride,' cried Francis; 'and that is thralldom far more ignoble than is his who literally wears a chain of bondage. I tell you, Fred, that the pursuit of an honest calling, however humble, would be honourable to your character, instead of entailing disgrace; and your creditors would be more likely, at some future period, to offer you further assistance in setting you up in your business again, if they saw that you were industrious and steady.'

'Ah, all this is very fine in theory, but it will be very difficult to practise it.'

'You know that I am not above being in the employment of another,' the younger brother remarked.

'True, you fill a subordinate situation; but then you have others under you.'

'All this is great folly, Fred,' Francis resumed; 'nay, it is worse than folly. The grand criterion of respectability is for a man to do his duty, let that duty lie in whatever path it may.'

After the usual law process, Alfred Bolton passed through the insolvent debtors' court, and was set at large. All the worldly wealth he had then to call his own was a few articles of furniture and wearing apparel, and these he removed from his commodious house in town to a mean lodging in the Surrey suburbs. Even here, however, Susan's clever management and good taste produced an air of comfort; and she generously forebore to make any allusions to their former situation, lest her husband should imagine that she intended it as a reproof. With the view of assisting in the maintenance of the family, she recommenced the business by which she had supported herself prior to her marriage; but she now found it to be a difficult task. When a woman in the humbler classes of society has the charge of a young family, it is quite sufficient for her to fulfil those duties; and in proportion as her attention is directed to other objects, the comforts of home, and the mental and physical health of her children, must suffer. To Mrs Bolton there was, unhappily, no choice. No sooner was her husband at liberty, than he fell into his former practices; he put off the execution of the plan his brother had recommended, with the vague expectation of being able to get possession of what he termed his right. His days were therefore spent in transacting business in conjunction with a disreputable attorney, who fed his hopes with the agreement that his client should handsomely recompense him in the event of success; and his evenings in convivial parties at a tavern; for those by whom his society was considered a pleasant addition, paid his reckoning, with the resolve

to indemnify themselves when Bolton should become a rich man.

Thus week after week passed. The attorney, in the name of his client, now commenced proceedings against the executors of the late Captain Bolton's will; and the young man was in ecstasies with the prospect, which his own imagination filled up with gold, and all the luxuries it will procure. Susan was one morning sitting engaged with her needle, with her four surviving little ones about her—for her means would not allow her to send them to school, and their father's pride could not submit to the humiliation of receiving their education as a charity—when Bolton and his man of business unexpectedly stopped at the door in a hackney-coach. The former alighted in great haste, saying that he wanted to present some valuable papers which he had in his possession before the court.

'I wish you had come a few minutes earlier,' his wife observed. 'There has been a person here inquiring for you, and I have just said I did not know when you would be in.'

'What sort of a person?'

'An aged sailor-looking man with a wooden leg. Indeed I thought he had some especial motive in calling, for he seemed very anxious to see you, and made inquiries respecting your father.'

'Oh, he has some intelligence to give me regarding the money: how unfortunate I missed him. Which way did he go?'

'Down the street towards the Westminster Road.'

'I'll follow him. A sailor with a wooden leg did you say, Susan?' His wife nodded assent, and leaping into the vehicle, Bolton drove down the street with even greater haste than before.

Scarcely had Mrs Bolton reseated herself in order to resume her occupation, when a loud summons at the knocker brought her again to the door. It was her husband, who, having almost immediately overtaken the person he was in quest of, had sent the lawyer on with the papers, and returned with the view of questioning the man ere he himself made his appearance in the court.

'Be seated, my friend,' he said, placing him as he spoke an arm-chair by the side of the fire. 'You look weary; you shall have a glass of ale, and then I will listen to what you have to relate.'

'Mine is a sad story, sir,' the old man made answer, and he looked very complacently at the refreshment which Mrs Bolton now brought forth.

'You have some particulars to give me regarding my family?' Bolton observed, a little disconcerted at the last remark.

'Well, sir, I don't know yet whether it may be about your family, but I hope it is.'

'I don't understand you: I thought, from what my wife told me, that you knew my father, Mr Francis Bolton; and I concluded, as you were a sailor, you had some knowledge also of Captain Thomas Bolton.'

'Are you the son of Francis Bolton of York, sir?'

'I am.'

'And you've a brother called Alfred?'

'No: I am Alfred Bolton—my brother's name is Francis. I am the eldest son, though I was not named after my father.'

'Then I believe you are the young man I am in search of.'

'Well, well, my good friend, now you are satisfied on that head, let me hear what you have to communicate. I have a fortune resting on a straw, and I'll pay you well if you can turn it in my favour.'

'A fortune?—pay me?—I don't know what you mean, sir.'

'Don't you know that I am the rightful owner of Captain Bolton's property? Haven't you come here for the express purpose of telling me what you know of him?'

'Not I, sir: I know nothing about such a person. I came here to find out my brother's children.'

'Pshaw, old man, what are your brother's children to me? Don't you know, then, anything of Captain Thomas Bolton of the royal marines?'

'Not I, sir.'

'Then what did you come here for, fellow?'

'Softly, softly, Alfred,' Susan gently interposed: 'respect the gray hairs of this poor man: either he or you are under some mistake in this matter.'

The sailor turned to her with an expression of deep gratitude. 'Why, ma'am,' he hesitatingly said, 'I didn't say who I was at first, because I wanted to know whether I'd found the right person; but I'm pretty sure now.'

'Who are you then?' Bolton almost fiercely asked.

'Well, sir, I ain't ashamed to own my name, though I am poor, and have only one leg and a stump to carry me. I assure you I've never disgraced my kin, whether they own me or not.'

'Who are you, old man?' Bolton again vociferated.

'Why, sir, I'm Thomas Bolton.'

'Thomas Bolton!'

'Yes, sir; I am the youngest boy, who ran away from home—the brother of your father, sir.'

'Tis a falsehood!' cried the young man, stamping his foot furiously on the ground. 'You've been sent here by those knaves of executors.'

Again Susan interposed, entreating that her husband would listen calmly to what the old man had to say.

'I've nothing else to say, ma'am,' he rejoined. 'If your husband won't believe me, but turns his back upon his nearest kin, why, I'll take myself off, that's all. It shan't be said that Tom Bolton ever cringed for a meal.'

'You shall not go. I'll have you taken up as an impostor. I'll sift this foul concern to the bottom.'

'Taken up?—foul concern? I really don't know what you mean, sir. I ask you for nothing, if you don't think proper to own me as your uncle—only I'm a little disappointed.'

There was such an air of truthfulness, and so much simplicity in the aspect and manner of the old man, that Susan felt at once convinced that his statements were correct. She dared not, however, say this to her husband in his present irritated state of mind; but drawing him aside, ventured to suggest that he should detain the sailor by gentle means till the return of the attorney, who, she said, would, by a few cross questions, soon discover whether it was as he suspected.

Bolton heaving, from the decision of his own judgment, some fears lest his humble guest should be able to prove his identity, listened to her counsel. If his cause were indeed hopeless, he had no wish to involve himself in any further law expenses. Therefore bidding the old man reseate himself, and take the refreshment which was placed before him, he paced up and down the room with impatient yet less angry gestures.

It was not, however, till Susan had earnestly intreated and whispered an apology for her husband's harsh language, that the old man would comply with the request. But he could not resist her pleadings; and in a few minutes he had the children about his knees, begging him to tell them some story of the sea.

'I should very much like to be a sailor,' exclaimed the eldest boy.

A speaking glance from the mother followed this speech. It was a glance which said, if you regard my feelings, encourage not this wish. The old man read in a moment the expression of her moist eye, and sympathy, or it might be the recollection of his own gentle mother, caused a glistening drop to roll down his sun-burnt and furrowed cheek.

'Ah, that is just what I thought, my fine fellow, when I was your age,' he returned, drawing the boy closer to his side; 'and when my father and mother said I should not go, I was wicked enough to say I would, and then to run away from home. But I've often wished I hadn't done it. I soon got tired of the hard work and the hard fare; and I was frightened when the wind tossed the ship about, and I had to climb up the rigging

and take down the sails: and then I often cried for my dear happy home and my good father and mother; and I wanted to play at my old games with my brothers and sisters; but 'twas too late!

The child looked thoughtful, the mother grateful, and the old man, with evident emotion, went on—'Learn a lesson from me, my little lad,' he said. 'If you wish to be a happy man, don't be a disobedient, bad boy. I've seemed as happy, and laughed as loud, as any of my shipmates, but I wasn't happy none the more for that. I used to think of my poor mother, for I knew she'd cry every time she heard the wind roar; and I'd have gone back to her, but they took care I should not leave the ship. So I never saw her again; for when I was a man, and got leave to visit my native town, she was dead, she and my father too; and my brothers and sisters were all gone to live no one knew where, so I was left alone. Oh, I was bitterly sorry that I ever left them; and here I am, in my old age, lame and homeless, and without a relation to own me.'

The conversation was here interrupted by the reappearance of the attorney. He entered with an aspect which told of disappointment, ere his lips communicated a word. 'It's all over with us!' Bolton muttered, being by this time quite convinced of the old man's identity. He drew the man of business into an adjoining apartment, and there received the corroboration of his worst fears.

The total blight of his lofty expectations had a worse effect on the mind of Alfred Bolton than even the hope of wealth had produced. His habits of idleness and intemperance grew more fixed; his temper became morose and even fierce, inasmuch that his gentle wife trembled in his presence; and his children fled from him with dread. Susan's relatives, justly indignant at the treatment she received, would have assisted her and the children, if they could have induced her to leave him; but bad as he was, her heart clung to him with affection, which had been too long and too ardently cherished to be extinguished even by his brutality. Thus year after year passed away; but the constitution of the young man, which was naturally delicate, could not bear up against the poisonous effects of a continuous course of intoxication. He fell a victim to that ruinous vice which has slain its thousands and tens of thousands; and his wife was left a widow, his children fatherless.

Widely different was the career of the younger Bolton, and consequently the fate of his family. His strict integrity and undeviating good conduct won the respect and confidence of his employers, and he was raised, step by step, into more important and more lucrative situations, until he became a junior partner in the firm. A few years subsequently, the elder merchants, growing fatigued with the cares of business, retired, and left the whole concern in his hands. The change in their circumstances did not, however, call forth any undue elation on the part of either Francis Bolton or his amiable wife. They had a commodious and well-furnished home, instead of the humble second floor with which they had commenced their married life; a well-spread board, and all the comfort and conveniences which money can so readily procure; but there was no vain display—no attempts to vie with persons of rank and fashion—no affectation of their manners and amusements. Mr Bolton was known as an open-hearted, generous, and affable individual, and his wife as a gentle, unostentatious matron, who had ever a smile for a friend, and a guinea for an object of charity. None spoke of their sumptuous dinners, their elegant soirées, or their splendid equipage; to be respected and beloved was the guardian they desired, and this they freely received.

The sequel of poor Susan's fate is sad to relate. A life of extreme mental and bodily suffering could scarcely be a long life. She died prematurely—one of the many innocent victims of vice—but not hopelessly; for her last days were cheered by seeing her boys under the protecting care of her excellent brother-in-law, and by

the kind assurances of Letitia Bolton that her daughter should, at her death, be received into their family as one of her own children.

THE WEST INDIA VOYAGER.

Dec. 15, 184-. We sighted Jamaica early this morning: at five o'clock the whole of the south-east end of the island was visible—the Blue Mountains forming an admirable background. They are not less than thirty-five miles off, and yet seem under our bow. To one who has learnt to measure distance in the tropics, however, by the shades of objects, they seem as distant as they really are. The whole island is covered, from the beach to the summit of the hills, with verdure; but it appears at this distance arid and barren, with all the peculiar ashy-brown tints which strike one so much in Roberts's paintings. These tints are the signs of distance, and form, with the intense blue of the sky and sea, and the green of the nearer parts of the shore, a combination of singular beauty.

Jamaica, Dec. 25.—A Christmas-day to be remembered! The thermometer at 80 degrees: the dinner, turtle and plum pudding! In England, a lunch of 'turtle and Madeira' would sound very extravagant; here it is among the most economical. The extravagance is in bread, cheese, and porter—the one a shilling a pound, the other a shilling a bottle. The negroes live much better than the English labourers at all events. They are, in town, generally married from carriages, which they borrow of their old masters, and are always dressed expensively on such occasions. They have often white bread in their houses; and this Christmas time we met hundreds of them returning from Kingston market, whither they had gone, some forty miles on foot, to buy their Christmas feast. In this district, where, in the time of slavery, white bread was seldom to be had, it is sold in large quantities, and chiefly to the negroes. Nor can this excite surprise. A man and his wife, working two days a week on their own ground, will supply themselves with ordinary provisions; the proceeds of the other four days—or eight shillings—they can afford to spend on luxuries. The general feeling on the south side of the island is, that while drought and heavy taxation have lessened the means of the people, the diminution of their contributions for schools and other purposes is to be attributed chiefly to an increase of artificial wants, and the loss, in some degree, of their interest in religious instruction. All the schools are suffering from this cause.

The negroes are very fond of fine names, or expressive ones. They often call their children 'Prince George,' 'King William,' 'Lord Sligo,' without any surname at all. Their houses are—'Content,' 'Come See,' 'Much Sweet,' 'At Last.' Their horses, if they work well, are sometimes 'Bolus,' if they draw well, 'Blister!' The cleverest name yet given to a horse in this island is thought to be 'Grathy,' as it affords ample opportunity for the exercise of their inventive genius. 'Top Ography' bids him stop; 'Ge Ography' bids him go; 'Sten Ography' bids him stand. All catch this spirit. 'Saddle Faith, and give Hope her corn,' said a friend last evening. He afterwards told me that 'Charity' had fallen and broken her neck some months before!

Stony Hill, near Kingston, Jan. 1, 184-. Here we are amid the finest scenery I have yet witnessed in Jamaica—nine miles from Kingston, at the country-house of a friend. Before us lies the city of Kingston, the fine harbour, Port Royal, and a beautiful savanna of several miles in extent; around us are the Liguanea Mountains, on one of which our house stands. It is now

winter, but the double jessamine, the thumbergia, and flowers of all hues and shapes, are in bloom. The house is called a cottage, and has a pleasant garden, and eleven acres of Guinea-grass attached to it.

From Stony Hill we have a view of the harbour of Kingston. From Port Royal (which is at the entrance) to Kingston is seven miles, and from east to west the harbour extends, in the widest part, not less than fifteen miles. The whole is completely land-locked, and is celebrated for the security of the anchorage, and its sharks! More than once we noticed the surface of the water cut by the dorsal fins of a couple of these monsters. They are greatly dreaded by the negroes; and not without reason. Among the curiosities of this residence are the India-rubber tree, the melon cactus, the rose, the sand-box tree, with a seedpod that makes an admirable sand-box; and the romantic mountain scenery, reminding me every here and there of Switzerland. The breeze, too, is very refreshing, and the water and fruits delicious. Among the interesting occurrences of the last day or two, I may reckon a visit to the coral reefs near Port Royal. The branching coral, and the brain stone, as seen in the depth of the water, have a very magical effect: they look like a submarine forest, and tempt you to plunge down and walk under the shade. Have I ever described a night in Kingston? It is noteworthy. The nights I spent there were generally moonlight; the sky a beautiful blue; the moon's rays of silvery whiteness, giving the appearance of snow to the roofs of all the buildings in the city. Your windows are of course left open, the jalousies being shut so as to exclude the moon's beams. As you go to bed, and when you have laid yourself under the sheet, you are tormented with a curious unearthly buzz. It proceeds from a delicately-shaped insect, with tiniest body, long legs, and most voracious head and feelers: it is the mosquito. Its buzz continues till it sends you into a fever, or a broken troubled sleep. But why not cover yourself up in the sheet, you ask? First, it is too warm; and secondly, the sheet will not protect you. The buzz continues, and if the animal is so minded, it can bite through sheet and all. It is the everlasting buzz, however, that will most tease you. . . . After you have been an hour in bed—supposing you to retire about ten—hark! the cocks are crowing! and as Kingston is full of these 'feathered bipeds,' they crow at each other till morning. 'Cock-crowing' in Jamaica means from eleven p. m. to eight a. m. At the same time the dogs begin their music, and go on barking at each other, or the moon, till daylight. They may be seen prowling about the city all day, very much as in the East. The mosquitoes, cocks, and dogs of Kingston, no visitor will ever forget.

Mount Charles, Jan. 2.—I have hardly done Jamaica justice. Our ride to-day has equaled our Swiss rides in beauty: the hills are most rich in vegetation, and very romantic: the valleys, too, abound in cane-pieces and cocoa nuts: Mount Charles is the sunniest, prettiest spot I have seen—a high hill, with hills and valleys of every shape and size around. The entire landscape extended not less than fifteen miles in each direction; and though I missed the background of the Alps, we had more than Alpine luxuriance and softness. We here witnessed a negro wedding; and though I cannot say that the lady blushed 'celestial rosy red,' I have no doubt, judging from her trepidation, that she felt in her heart all the maiden modesty and virgin pride of which blushing is the appropriate sign. She was dressed like any lady: satin, orange blossom, and French white, according to the approved style in such matters. They sent us a piece of their wedding cake; not the crowning summit of the loaf (which is always kept for some patron-lady), but an inferior piece, which they deemed good enough for bachelor friends.

Port Maria, Jan. 4.—The Jamaica people say that their seasons are quite altered since freedom, as is everything else. The very fish will not be caught 'since freedom': birds are scarcer and wilder 'since

freedom:' the rains, which ought to have come and gone before now, had they observed old rules, are still prevalent. Yesterday morning I rode from Annotta Bay to Port Maria, fifteen miles, through regular tropical water-spouts, and over one of the worst roads in the island.

Falmouth, Jan. 16.—I am now in this sea-side town, with morasses on each side; our only comfort the daily visit of the 'doctor,' as the strong sea-breeze is called. On Monday we go on to Montego Bay and Lucre; and on our return take another group of villages inland, till, by the middle of February, we hope to reach Kingston again. During the last few days, we have seen several sugar properties, and have been interested in the process of sugar-making. A sugar estate, with its waving cane-pieces—looking not unlike a Brobdignagian corn-field—its whitewashed house and mill, its upland Guinea-grass and forest, is a very beautiful scene; nor less beautiful for the presence of the negro workman—'God's image in ebony,' as Mason Goode calls him—and his white dress. Unhappily, the bad economy of the sugar estate is as obvious as its beauty. Every estate has, as we noticed, its sugar mill and boiler—the whole kept up at a very enormous expense, and used for about three months in the year. If every farm in England had its corn-mill worked by water-power, the water being brought to the mill by expensive aqueducts, we should have at home a sample of Jamaica management. The sugar is boiled, too, in open pans, at a higher temperature than is necessary, and with a large waste of materials. The air of the boiling-house is laden with sweets. . . . Nothing strikes a stranger more in Jamaica than the large amount of land not under cultivation. The hills, and many of the valleys, are all in bush. Twice or thrice the present number of inhabitants might find support and employment in the island. At the same time, it can hardly be doubted that there is now quite as much labour as there is capital to employ it. The labour is considerably in excess. This deficiency of capital shows itself sometimes in the non-payment of wages, but chiefly in the refusal to employ the labourers continuously throughout the year, and in consequent defective cultivation. For estates now under cultivation, there seems capital enough to plant the canes, and to cut them, but not to do justice to the soil. The consequence is, that for four or six months in the year the demand for labour is excessive, and at other times there is no demand at all. The only security against this serious evil is large capital and efficient cultivation: with these appliances, the evil will cure itself in a very little time. In one parish, the land and management are so improved, that crop time continues all the year round; the labour is regular, and never excessive; and as each cane-piece is finished, another is ready.

Some English proprietors whom we met here, and who have visited Guiana and Cuba, assured us that, with English enterprise and skill, even the older islands, like Jamaica, have nothing to fear from Spanish competition. The grand defect in the social economy of the West Indies, as I formerly hinted, is the want of a resident proprietary with capital and skill. Just fancy the consequence of land in England being managed not by the delegates of absentee proprietors, but the delegates of parties who possess mortgages over the properties. Of course nothing but ruin and discontent would be the result.

Havanna, Cuba, March 11.—The first city we have yet seen; a very noble one too, with Boulevards, European hotels, Moro-Spanish buildings, tomb of Columbus, volantes, galights, oratorios—'Israel in Egypt' being to be performed this very evening—and slaves!

Yesterday morning we went on shore, and after paying a brief visit to the British consul, with whom our letter from the Governor of Jamaica found marked favour, we hired a volante, and drove through the city. A volante! only mark it—a horse, a carriage, and a

pair of wheels—the horse with his tail platted, and fastened by a silver-embossed strap to the saddle; the saddle occupied by a slave, dressed in gigantic Spanish boots, with spurs of Don Quixote fashion, and smart livery; the carriage, suspended on leathern straps between the horse and the wheels, easy and elegant, not unlike an English cabriolet; the wheels, never less than six feet high, seem made to run behind, and really answer their purpose well. The length of the whole concern is about thirty feet, and the motion is very agreeable. Having mounted our carriage, we were *fed* away to the Boulevards—a very fine ride, of a mile or two in length, each side of the road bordered with flowering shrubs and the cabbage-palm; seats, and statues, and fountains, placed at due intervals, and very splendid buildings at each end. At *three* o'clock we dined at an American hotel, in American style; agreeable enough for once, though I could not help looking at the negroes who waited at table with more earnestness than became a visitor. In the evening we took another drive, and witnessed some novel scenes. We went again to the Boulevard, or Paseo. It was nearly six o'clock, the witching hour of the tropics: the intense blue of the heavens had given place to light snow-like clouds, which floated gently in a rich puce-coloured sky: the sun's rays had ceased to point towards the earth, and were all stretching away in solid masses of light to the heaven. The whole city is astrid at this hour: the stores are closed, volantes fly in every direction—that is, up and down, for the Paseo is straight, and the volante cannot easily turn. Each has a rich freight of ladies in full dress, without hat or cap, arms and neck uncovered, their form rather more revealed than hidden by the dark Spanish mantilla that supplies the place of bonnet and cloak. The volantes pass on, to us endlessly—for we left them, after an hour's ride, passing still, each more splendid than its predecessor, and filled, as you suppose, with black eyes and roses. In the morning we visited the cathedral, a handsome building, where at length the ashes of Columbus find their resting-place. They were first buried in Valladolid; then moved to Seville; then to Hispaniola. When that island was ceded, in 1795, to the French, they were again moved, with much pomp and ceremony, archbishops and admirals taking part in the service, to their present resting-place—the wall of the cathedral of Havana, on the right side of the grand altar.

At Havanna, the tidings reached us of the loss of the *Tweed*, an event which filled every one with concern, and led me to change my proposed route homeward.

At Sea, March 19.—By means of a quick-sailing vessel, we have just reached the *Tay* steamer on its way to England by way of Bermuda. It was a novel scene, the transhipment of a large freight of passengers and goods in the middle of the ocean. Sixty passengers, including twenty children, were transhipped in small boats, and on a rough sea. Some very narrow escapes there were, but happily all was done without accident. The ladies, who had to climb up our sides, the sea running very high, looked the very image of weakness and resignation, their worst fate being to be seized by the sailors, and passed up—as so much bullion or quicksilver—with great care. The children were generally seized by the back as old wives seize chickens, and 'hauled aft' in very edifying style. One little thing, some twelve months old, had a very narrow escape. Our ship was pitching a good deal, and the captain, who held her, lost his hold; he caught her again, however, and beyond a little alarm, and an awful cry from the poor mother, the whole resulting in an equally awful squeeze of the poor child afterwards by the mother aforesaid, no harm was done. By four o'clock, all the cargo and passengers were on board; and the *Tay*, which had kept all day at a cold and respectful distance—as cold a distance as the tropics allow—left us for Havanna, and we came on towards Bermuda. Last night it blew half a gale, and the creaking, and sighing, and squalling, and 'cascading' (as the negroes

poetically call the outward and visible sign of sea-sickness), were such as he only can conceive who has been in the Atlantic, with a strong north-east wind, and three thousand miles of sea on which to work its will.

March 24.—Reached Bermuda, a most beautiful group of islands—the Atlantic Windermere. The islands are very picturesque, and dotted all over with neat houses, with white sides and white roofs: the fortifications are handsome and strong: the population remarkably well off—the very convicts (of whom there are fifteen hundred) happy-looking and civil. The scenery combines the beauties of the Isle of Wight and the Cumberland Lakes; the sea a very light blue; the buildings white sandstone; and the people half black, and half brown and white. We remained a couple of days. All the first we were kept on board in the middle of the bay by a severe gale; the second we spent at the capital of the islands, and dined on roast beef, new potatoes, and green peas!

All the pilots on these seas are black men. Those we saw were shrewd clever fellows. As we left the islands to-night, we saw more than one whale spouting his stream of water into the sky.

On Ireland island we visited the cemetery of the colony, one of the most beautiful I ever saw. The majority of the monuments seem to have been erected by soldiers or sailors to their comrades. One consists of two rough rocks, with the names of those whose loss at sea it records inscribed upon them. It looks as if the grief of their friends had seized the first object it found to give expression to its intensity, and obtain relief: a pretty idea!

April 3.—Eight hundred and ninety-five miles from the Lizard! Verily, a passenger has need of patience. We measure our distance from home every day, and ask every hour of our rate. We are probably not in the best humour for forming a fair opinion of our fellow-passengers: every one longs for England. The winds, too, are very keen; and, worse still, are contrary. Free from all these prejudicial influences, however, I cannot but think our companions not the most interesting. But few ladies are on board: the more the pity. 'Spirits masculine' don't produce happiness.

Did you ever go on deck at half-past nine at night, as I have done for the last month and more? It calls forth curious feelings. When we left Bermuda, we seemed to have closed one volume of life; the next we are to open in Europe, or England rather. There is much to read in the interval however: the very sky and sea look awful: clouds cover the one—you can hardly see our mainmast—and bawling, boisterous waves the other: the wind is gusty: the sails half bent, as if doubtful whether the wind comes as friend or foe: the spray dashes over the deck: the boatswain, albeit not of a talking mood, is ready to spin you a yarn: the ship rolls and pitches fearfully: your walking is a mere burlesque. For one whole hour (you can undress in the dark, and all lights are put out at half-past ten), however, you have to stagger from paddle-box to stern, folding your cloak around you, and bidding a cheerful good-night to your fellow-passengers.

Last night I had a long chat with the captain. 'It's all luck, sir, that we are not lost in these seas,' said he. 'You saw that wreck yesterday? Why, if we had struck her at night, as some ship may do, we should have sunk her; but she might have stove us in. You saw that vessel to-day? If we had got our wheels upon it twelve hours later, it would have disabled us in one of our wings, and kept us at sea five or six days.' 'Fire must give you some anxiety in these vessels, captain?' 'Why, yes, our cabins are of thin light wood, and if they once caught fire, they would burn like tinder. Only this very night I found three of the children opening the lanterns and admiring the lights: in another minute they would have put up their paper-matches to see if they would burn. It's all luck that we are not burnt long ago.'

April 4.—The wind changes, shifting from east to

north—cold, piercing, angry-looking, as if it meant to say, 'Who are you? What brings you here?' We meekly answer, 'We are going home—let us pass.' 'Home! what know I of home? However, you may pass on!'

GERMANS, ENGLISH, AND SCOTCH.

We are not sure that a very brief visit to a country enables a man to theorise more correctly on the national character of its inhabitants, than if he had remained at home and weighed the conflicting testimonies of books. First impressions are rarely true; and the raw traveller must get over his sensations of novelty, before being able to philosophise to advantage. A book lying before us* is not merely the result of a hasty view of some of the most remarkable nations of Europe, but the mind of its author is saturated with a particular subject, which gives a peculiar tone and colouring to all his speculations. This subject is doubtless the loftiest imaginable; but religion, however admirable and indispensable in itself, does not enable us to judge of art or science, or of men in their social relations generally. Were such the case, a devout recluse, wholly untainted by the follies and vices of the world, would be the best traveller.

The author, whose work the 'Protector' was recently noticed in the Journal, is a minister of Geneva, who was deputed in 1845 by the Evangelical Society there to visit Germany and Great Britain, for the purpose of drawing closer the bonds of Christian union between these countries and his own city. In his present production, however, we must look neither for new information, nor for profound views based upon his own experience. The book might have been as well written—perhaps better—if he had never left his own study at Geneva. It rarely even professes to give the results of personal observation, and almost never adduces facts for the support of theory. In the most interesting part, it is a devout essay on national character; in the rest, it is an examination of various religious questions, and a historical summary of the fortunes of the church militant in Scotland, from John Knox to Thomas Chalmers. The style is not Scriptural, but as thickly inlaid with Scripture as a village sermon, being in some places a mere cento from the Sacred Writings.

If the book is but little satisfactory to the mere literary critic, we fear it will be still less so to the religious world. Party politics have gone by, and religion has taken their place. The church is up. The voices of the senate and the platform, which used to stir us like the clang of a trumpet, are drowned in the thunders of the pulpit. 'He who is not for us is against us!' is the cry on all sides; and it is safer to belong even to a weak party than to tolerate more than one. Our author is aware of this theoretically, but is not sufficiently careful to apply the rule to his own conduct. One of the few anecdotes he tells announces the fact as regards Scotland in a very amusing manner. A deputation in Edinburgh, he says, from some colonial churches, after wavering for a long time between the Establishment and the Free Church, at length decided, in utter puzzlement, to belong to *both Assemblies*—a resolution which was repulsed disdainfully by the Established, and received in the Free Assembly, where the doctor was present, with shouts of laughter! Dr D'Aubigné, notwithstanding this warning, sides to a certain extent with Episcopacy, Presbyterianism, and Congregationalism at one moment; and in fact

he appears to be at some loss, except in his official capacity as an envoy to the Free Church, which to prefer. What he desires is, 'the very essence of Christianity—divine life, true evangelism,' without minding the denomination; and to this we should have nothing to object, were it not sufficiently obvious that he desires, at the same time, to be all things to all men—with the exception of course of Catholics, Jews, and infidels.

Our author, in addition to the present visit, spent several years in Germany in his youth; and the view he gives of the national character may therefore be considered to be of some value, though still the view of a student rather than of a traveller. 'The German,' says he, 'has several features which distinguish him in a striking manner from the Englishman and the Scotchman. He lives within himself; he seems born for the ideal world. His faith, when he has any, is rather in his head than in his heart, and he easily loses himself in mysticism. He feeds upon the ideal; he seeks out the first principles of things, their general laws, their essence. Systems of philosophy succeed one another in his country more rapidly than forms of government with the people most changeable in politics.'

'While elsewhere the life of man assumes more and more a public character, the German leads a solitary existence. He lives in his study, from the window of which, late and early, the light of his lamp is seen shining. A friend of mine, a Frenchman by birth, who resides in a university town, opposite one of the professors, said to me, "That is a singular man: I really do not know when he sleeps: his lamp is always burning!"' The Germans are a people to be taken separately and singly; they have seldom or never hitherto formed into groups and parties; and it may be said of Germany, as regards the empire of thought, what the Bible said of Israel at one period, with regard to social order—"In those days there was no king, but every man did that which was right in his own eyes." . . . Hitherto the German has been contented to live alone at his ease, among his own ideas, his own faith; perhaps even in some cases his own errors. Faithful to the character of the ancient Germans, he seeks, not indeed in the seclusion of forests, but in the mysterious depths of his own mind, some undefined divinity which he worships. *Deorumque nominibus appellat secretum illud, quod sola reverentia videtur.* But a new epoch has now begun: throughout Germany, individualities are tending to unite and form into groups. The scattered members are here and there collecting into a body. The bones are gathering together, according to the prophecy of Ezekiel; sinews are coming upon them; flesh is growing; and soon they will stand upon their feet an exceeding great army.'

Let us now turn, for the sake of the contrast, to the English character, in which the aid of the lamp is still more obvious. 'If the German feeds upon the ideal, the practical is the characteristic of Great Britain; I say Britain, because most of what I say here of England is applicable to Scotland also. Reality, action, business, bear sway in the politics, the industry, the commerce, and, I will even say, in the religion of the English. Yet this practical tendency which characterises England is not selfish, as might have been expected. The large scale on which the people work, gives a certain scope and grandeur to the imagination. The habit which the English have of forming into parties, and of looking constantly at themselves as a nation, is opposed to a narrow selfishness; and a more elevated sentiment struggles with this vice in a large portion of the people. . . . The constitution of Great Britain, the balance of her powers, the slow but sure energy of the universal thought of the people—all this is so beautiful, that we cannot but recognise the Master-hand. But I did not leave the continent to study the wondrous mechanism of this state, I therefore content myself with saluting it respectfully as I pass on. . . . I observed in England one thing—that the people talk much less of liberty than we do on the continent, but practise it more. This is quite natural: when we possess a thing, we mention it less frequently than when we are in search of it. The young

* Germany, England, and Scotland; or Recollections of a Swiss Minister. By J. H. Merle D'Aubigné, D.D. London: Simpkin, Marshall, and Co. 1846.

men, who play so important a part in Germany, and even in France and other countries, do not so in England. It is not for want of spirit in the English youth—they have even rather too much; but it is confined in the preparatory sphere of schools and colleges, and does not display itself in public business. Influential institutions satisfy this people. The young men know that their turn will come, and they wait quietly. Among a people deprived of public institutions, vigour is often misplaced; it is forced forward in youth, and exhausted in riper years. In England, on the contrary, it is disciplined in youth, and exerted in manhood. On the continent, paternal authority is much shaken; in Britain, the parents, generally speaking, know how to keep their children at a respectful distance; and this is a great element of strength for a nation. When the Bible would pronounce a threat against a people, it says, "I will give them children to be their princes, and babes shall rule over them." This curse has been but too well fulfilled among many nations. When the unfortunate Legislative Assembly was convened in France after the Constituent Assembly, the multitude of extremely young men was notorious; and when the president by seniority, in order to form the provisional committee, called upon the deputies, who had not yet completed their twenty-sixth year, to come forward, sixty youths crowded round the tribune, competing for the office of Secretary to the Assembly. This predominance of youth is an evil which, thank God, is still far removed from England. The common people, merchants, aristocracy, all come in for their share of the laudations of this courtly minister. 'In Britain,' says he, 'of all the countries in the earth, the nobility have the most power. The king or queen is but the keystone of the aristocracy. This aristocracy also wears its greatness well. There is in the manners of the great ones of England a nobleness, a grace, a simplicity, an exquisite perfume of sociability, and a regard for their inferiors in the social scale, which wins every heart. There is among the English, especially among the aristocracy, a physical beauty celebrated all over the world, and with which the moral beauty of the mind is often in harmony. These nobles have not merely, like those of some other nations, an external polish, but there is within them an internal grace, a politeness of the soul.' Finally: 'Such, then, are these common people, so full of intelligence and activity; these rich men, so simple and so generous; these nobles, so amiable and so fond of liberty. It is a remarkable nation which is the result of such an assemblage. What enthusiasm among all classes of this people for great ideas! It is ideas, indeed, which thrill this people when a foreigner, whose name is linked with some principle, or some illustration, comes to visit them. It matters not whether he belongs to the highest or to the lowest degree of the social scale. We know how they welcomed Marshal Soult, who had fought against England, but who was in their eyes the personification of French glory; and humble and obscure individuals have also been received with unheard-of kindness, merely because their names were considered by our insular friends as attached to some great idea—to that, for instance, of the Reformation. In this respect, I will not say merely that England surpasses the continent; there is nothing like it among us. Our people are, as it were, insensible and dead, while the people of Great Britain are full of feeling and life. It is a nation complete in all its parts; our nations, in this respect, are mutilated. It is true that Germany begins to present some manifestations of this kind; but it is to be regretted that they are not in the best of causes.'

His dogmas touching the Scottish character—for everything here is the dogma of a student, not the inquiry of a philosophical traveller—are equally complimentary to the nation. 'I found the Scotchman kind, cordial, hospitable, active, and generous. If I had accepted all the invitations which were given me in Scotland, to spend only a few days with each, I should certainly have been there until now. What excellent people, what love, what Christian life, what zeal, what devotedness among all those

kind friends by whom I was surrounded! I only regretted that what might have filled up a year was crowded into a few days. I was more especially struck by the energy of this people—their energy of feeling, of words, and of action. There is still something of the old Scots and Picts in these Christians of the nineteenth century. . . . The Scotchman has even the defects of his good qualities. If there are any who are suspicious, violent, intolerant, or bitter, they are not so by halves. This is to be found in the most legitimate controversies; as in the Apocryphal controversy, for instance, which, although founded on justice, was sometimes carried beyond all reasonable bounds. The same may perhaps be said of more recent discussions.' He has some pertinent remarks, however, on the scholasticism of our preachers, and the endless ramifications of their subjects, and desires earnestly 'one single sigh—one burst of the soul,' instead of all these distinctions, orthodox as they may be. He considers both the discourses and the prayers, but more especially the latter, to be too long. In other matters of observation, however, the doctor is less at home. He is of course in raptures with the romance of Edinburgh; but shows, unfortunately, that this is only in compliance with conventional necessity—by his traversing the cool groves of the valley (the bed of a railway) which separates the Old Town from the New, in order to wander among certain imaginary Scotch firs that adorn Arthur's Seat!

The three nations he thus contrasts with regard to the great subject of his book—the church. 'In Germany, the Vandal spirit of rationalism destroyed everything; the church went to ruin, and that noble country presented a vast chaos, in which contrary forces were struggling together. But already the Spirit of God is moving on the face of the waters; the Divine word has been uttered, and the new creation is begun.'

'In England, they had not fallen quite so low. Ancient and venerable forms had been maintained; but, generally speaking, the true, the divine Spirit had forsaken those forms. In its place, a human spirit, produced by these very forms, had taken possession of them; and alas! still sits proudly in the antique porch of many a college and cathedral. But the true spirit, banished from these elevated stations, has found refuge in humble retreats, and is now about to come forth with power to attack the human and traditional one, and to drive it from its Gothic strongholds, and set up in its stead that which is always ancient, yet always new—the Eternal Spirit. If ever it gains the mastery, may it so accomplish the primitive reform, that these high places can no longer serve as a retreat for the enemy!

'Scotland is in a better situation. A victory has been achieved, but there are still many triumphs to be won. Victory has to struggle against victory itself. There are all kinds of dangers for success: there are those of lassitude and slumber, those of pride and disdain; there are those of idolatry, which makes an idol of all belonging to the conqueror; and there are those of narrowness, which forsakes the mighty river of Christian life, to confine itself in paltry conduits.'

The whole of the above remarks upon Scotland prove that we are right in refusing to concede to Dr D'Aubigné the character of a philosophical inquirer. Were it otherwise, we should have more investigation and less declamation. If it be true that our countrymen are the most religious people in Europe, it necessarily follows that they are the most virtuous and happy. A traveller, who desires to be rated at anything more than a bookmaker, should not be satisfied with stating the premises; he should ascertain the moral and social status of the people, and work upwards to its religious cause. If it be true that there is as much intemperance, crime, and misery in Scotland as in other countries, it must be untrue that there is more religion. The former are matters of *fact*, which should occupy the attention of an intelligent visitor; and he who contents himself with merely asserting the latter, is unworthy of the confidence of the public. But we should add, that Dr D'Aubigné is not alone in this obvious neglect of the first duty of a traveller; for, in fact, we do not know the author who has even attempted to perform it. We

hear on all sides the praises of our piety; we hear of rival communions, as if religious strife were something praiseworthy in the eyes of God; we hear of our great ministers, our ruling elders, our charitable deacons, our Sunday schools, but mingling with all these we hear the voice of ribaldry and blasphemy, and witness scenes of vice, destitution, and unspeakable wretchedness, such as it would be difficult, if not impossible, to parallel in the most despised countries of the continent. This involves a discrepancy which well merits investigation; and so far as we are concerned, the laudations of those pious travellers, who do not trouble themselves about the matter, enter at one ear and pass out at the other.

We leave the second part of the volume, entitled *Historical Recollections*, and containing an account of the religious struggles of the Scotch, to be dealt with by journals whom the subject more immediately concerns, and now close the humbler task allotted to ourselves, in the belief that we have enabled the reader to judge for himself of the scope and value of the book.

RAY THE NATURALIST.

SALLUST, in some spirited remarks, which he puts into the mouth of Caius Marius, contends against the false pride of birth; and in maintaining that he who creates a distinguished name for himself, is greater than he who merely reflects one from some distant progenitor, asks the question, 'What can make a difference between one man and another, but the endowments of the mind?' While cordially subscribing to this doctrine as far as it goes, we hold that there is a still higher distinction, when, unlike Marius, the possessor of these endowments is studious to dedicate them to the benefit of his race, and to lay their choicest fruits, as a thank-offering, on the altar of Him who bestowed them.

Such a man was the gifted individual whose name stands at the head of our present article. He certainly entered life with as few adventitious claims to eminence as might be; for his father followed the humble calling of a blacksmith in the little village of Black Notley, in Suffolk, where John was born on the 29th November 1628. Village blacksmiths in those days were not Elihu Burritts; but Roger Ray seems to have been impressed with the truth of the old saying, 'Learning is better than house or land,' for we find him manifesting an anxiety that his child should possess that knowledge, the want of which, in himself, he had no doubt often found cause to lament, by procuring his admission into a grammar school at the neighbouring village of Braintree, with the conductors of which he had probably some influence. That the early years of the young student should afford no food for his biographer, may be matter of regret, but scarcely of surprise; for even his after-career was unmarked by stirring incident. The life of thought, indeed, has little in common with the life of action. The bustle, the change, the feverish excitement, the jarring of opposite interests, the bracing of energy for strife, the embittered galling of defeat, and the noise and tumult of triumph—these, which are to the one the very elements of existence, are to the other its sorest trials. The world in which it lives is not the world of those around it; its aims are not their aims; its joys and sorrows spring from widely different sources; it has no interest in the glittering bubbles which the busy world is running after; it dwells essentially within itself, and asks but to be left in quiet, and forgotten. But in the depths of that solitude the mighty but mysterious process goes on, by means of which those who

occupying its place; and there is no doubt that much was done at this early period to lay the foundation in Ray's mind of that patient spirit of investigation, that untiring perseverance, that self-dependence, and that deep but unobtrusive piety, which were so conspicuous in his after-life. He himself certainly speaks of applying his time to little purpose; but that may only show that his conceptions already exceeded his powers of embodiment.

In 1644, we find him transferred to the university of Cambridge—a tacit proof that his progress, however unsatisfactory to himself, was not unfavourably regarded by others; and this presumption is strengthened by the fact, that he was shortly afterwards highly spoken of for the extent of his acquirements in Greek, Latin, and natural history. He certainly enjoyed the advantage of studying under Dr Duport, at that time so deservedly eminent as a profound classical scholar; but that much of the merit lay also in his own mental powers and energies, is placed beyond a doubt by the testimony of the doctor himself, who declared that Ray was decidedly one of the most talented of the pupils who had ever been confided to his care.

These early indications of genius soon attracted the attention of some of his leading fellow-collegians; and his unassuming manners, and gentle and amiable disposition, soon deepened prepossession into friendship—a friendship which, in several instances, was only terminated by death. As these intimacies included some individuals as eminent for piety as for talent—such as the celebrated Isaac Barrow, and Dr Tenison, afterwards Archbishop of Canterbury—it is probable that their intercourse deepened, though it did not originate, that determination to devote himself to the church which was at this time the great object of his life, and for which he studied with the unremitting industry which formed so marked a feature of his character. That, if circumstances had not afterwards altered his views, he would have stood as high as a theologian, as he now does as a man of science, may be gathered from the specimens of clerical capability which have come down to us. It was then usual for the candidates for holy orders to give lectures in the college; and a series of *commonplaces* (as they were technically called) delivered by Ray, in accordance with this custom, were so far from having anything commonplace about them but their name, that when afterwards rearranged, and published under the title of 'The Wisdom of God Manifested in the Works of the Creation,' the work not only ran rapidly through several editions, but underwent more than one translation; and holds, to the present day, a high rank among books of a similar kind (many of which have been formed upon its model), not merely as an exhibition of the dedication of high mental power to its noblest use, but as offering, in the clearness of its expositions, the cogency of its reasonings, and the amount and diversity of knowledge brought to bear upon the subject, one of the best guides for enabling less gifted minds to

'Look through nature up to nature's God.'

It may be easily imagined with how much delight a mind so amiable and gentle in itself, so full of unaffected piety, and so overflowing with affection for his fellow-men, must have anticipated the time when the pastor's office would make it the business of his life to disseminate these feelings among mankind; and the consideration will help us to estimate the high sense of rectitude which, when even these cherished feelings seemed to involve the slightest sacrifice of principle, could resign them without hesitation, and calmly and steadily alter the whole tenor of his life. This severe but triumphant test of his virtue was the passing of the act for enforcing uniformity in the year 1662 (two years after he had taken priest's orders), and was the more honourable to him, as he had no objection to the attestation thereby required to be taken against the Solemn League and

disapproved of it; but there was a clause in the act, that those who had taken that oath were not bound by their obligation, and Ray at once refused to make a declaration subversive, as he considered, of the very elements of rectitude and honour. He knew the penalty of his conscientiousness, and was content to pay it, though it included the sacrifice of all those prospects which his rising reputation, and growing influence with the dispensers of preferment, justly entitled him to entertain; an earnest of which, as was said, was the offer of a valuable living by Chancellor Clarendon. Ray was not a man to be lured from his duty by appeals either to his interests or his feelings, and he permitted himself to be ejected from his fellowship for nonconformity; thirteen other victims to the intolerance of the age suffering expulsion at the same time.

Ray's university career was honourably marked by academical distinction. He was elected Fellow of Trinity (together with Isaac Barrow) in 1649, and held successively the offices of Praelector Primarius, Junior Dem, and College Steward. He appears to have acted in the latter capacity for two years.

If being now decided that he was not to be numbered among those who have 'allured to brighter worlds, and led the way,' he began to give himself up more exclusively to the pursuits which seem to have held a place in his affections second only to those from which he was now precluded. He had already made considerable progress in the knowledge of botany, for his intense application to study in early youth had much impaired his health; air and exercise had been judged necessary to recruit it; and in these country excursions his mind, ever active, and ever alive to the attractions of nature in any form, soon found its interest awakened by the objects around it. The nature and properties of plants was a study into which a man of his tastes and feelings soon entered *con amore*; and his fondness for such pursuits was much strengthened, if not created, by a friendship which he had formed at Trinity, and which had a direct and powerful influence over the whole of his after-life. This was with Mr Francis Willoughby, of Middleton Park, Harwich, a gentleman whose fortune enabled him to enjoy life according to his own notions, and whose taste led him to find that enjoyment in the pursuits of science. Ray had been his tutor at Trinity; and congeniality of disposition, and mutual fondness for natural history, soon ripened this connection into an intimacy of the closest character. The bent of Willoughby's mind seems to have been chiefly towards ornithology; while Ray, though his investigating spirit was eager to imbibe knowledge of any kind, always evinced a predilection for botany. The state of the science was at that time so deplorable, that his first work on the subject, though no more than a dry alphabetical list of the plants indigenous to Cambridge and its neighbourhood, which he had noted and classed in his country walks, attracted so much attention, and seemed so far to arouse the public mind from its lethargy on this interesting topic, that he resolved to follow it up by a complete catalogue of the plants of the whole kingdom. The immense labour of such a work would have appalled most men's spirits, for there existed scarcely any book of authority on the subject, and nearly the whole must be the result of personal research, and toilsome and patient investigation. Ray, however, accustomed to depend on himself, and perhaps already taught, by the comparison of what he was with what he had been, to know something of the feeling which made Napoleon say that nothing was impossible, began to make his arrangements for the herculean task with diligence and alacrity, nothing daunted by the fact, that the previous one had taken him ten years to compile. In a letter to Mr Willoughby, he thus develops his plan:—"You remember that we lately, out of Gerard Parkinson, and *"Phytologia Britannica,"* made a collection of rare plants, whose places are therein mentioned, and ranked them under the several counties. My intention now is to carry on, and perfect that design; to which purpose I

am now writing to all my friends and acquaintance who are skilful in herbaria, to request them this next summer each to search diligently his country for plants, and to send me a catalogue of such as they find, and the places where they grow. For Warwickshire and Northamptonshire I must beg your assistance, which I hope, and am confident, you will be willing to contribute. After that, partly by my own search, partly by the mentioned assistance, I shall have got as much information and knowledge of the plants of each country as I can (which will require some years), I do design to put forth a complete P. B."

In the execution of this work he travelled over great part of England and Wales; and with a mind to which inactivity was impossible, stored up, in addition to the main object of his journey, a great variety of miscellaneous information, much of which he recorded in a diary, which he kept regularly during his tour, and which his friend and biographer, Dr Derham, afterwards published, with the somewhat quaint title of *"Itineraries."* During the following year he visited Scotland, having on this occasion the advantage of Mr Willoughby's companionship and assistance, but was not fortunate enough to find anything in this part of the country to increase his list—a disappointment mainly attributable to his having only examined the southern district (travelling from Berwick, through Dunbar and Edinburgh, to Stirling and Glasgow, then to Hamilton and Douglas, and then through Dumfries to Carlisle), a tract of country very similar in character to the corresponding district in England, while the northern portion, which would have better repaid his labour, was left wholly unexplored.

The investigation, so vigorously commenced in this country, was afterwards extended to the continent; the two friends, together with Sir Philip Skippon and Mr Bacon, travelling through the Low Countries, Germany, Switzerland, Italy, Malta, and Sicily, carefully examining as they went along, and making considerable additions to their stores. An interesting account of this tour was published in 1673.

His friendship with Mr Willoughby had by this time deepened into such a community of feeling, that the one did not hesitate to offer, nor the other to accept, an asylum, which the slender state of Ray's finances must have made highly acceptable, as relieving him from the necessity which Bacon so strongly deprecated, that 'he who had only wished to live to study, should now be obliged to study to live.' From this period we find him almost wholly residing at his friend's seat at Middleton Park, though he still made excursions into different parts of the country, to perfect such portions of his list of plants as appeared defective; for it was his rule not to enter one in it that he had not examined himself. The following account of the nature of his occupations at Middleton is extracted from a letter to his friend Dr Lister, and is interesting as exhibiting the untiring activity of his mind, and the variety of objects to which he directed it. 'My spare hours I devoted to reading over such books of natural philosophy as came out since my being abroad—namely, *"Hook's Micrographia,"* *"Boyle's Usefulness of Natural Philosophy,"* *"Sydenham on Fevers,"* *"The Philosophical Transactions,"* &c. The most part of the winter I spent in reviewing, and helping to put in order, Mr Willoughby's collection of birds, fishes, shells, stones, and other fossils, seeds, dried plants, coins, &c.; in giving what assistance I could to Dr Wilkins in framing his tables of plants, quadrupeds, birds, fishes, &c. for the use of the universal character; in gathering up into a catalogue all such plants as I had found at any time growing wild in England, not in order to the present publishing of them, but for my own use, possibly that one day they may see the light. I wish you would take a little pains this summer about grasses, that so we might compare notes; for I would fain clear and complete their history.' We also find him engaged for several years in a series of experiments on the nature of the sap in trees, and the order and manner of its

motion, the results of which were communicated to the Royal Society, of which body he was elected a member in 1667.

In the year 1672 he sustained what, to a mind constituted like his, must have been an irreparable loss, in the death, at the early age of thirty-seven, of Mr Willoughby, at once his pupil, his fellow-student, his benefactor, and his friend. By this event his worldly circumstances were somewhat improved, as that gentleman left him an annuity of £60 a year, besides the appointment of tutor to his sons, which obliged him to continue a resident of Middleton Park. He soon after lost another sincere and valuable friend, in the person of Bishop Wilkins, who had long held him in high estimation, and been anxious to use his influence for his advancement in the church: but time had not abated Ray's objections to the Act of Uniformity; and though he never ceased to regret his exclusion from the ministry, nothing could lure him from his principles. He remained, therefore, in seclusion at Middleton, dividing his time between the education of his pupils and the revision and publication of the manuscripts left by their father. A work on ornithology, in great measure, his own, but, with his natural generosity, ascribed wholly to Willoughby, issued from the press in 1675. It was written in Latin; and three years afterwards, Ray published an English translation, with considerable additions—evinced throughout the whole transaction not only the most scrupulous care of his friend's scientific reputation, but lavishing all the treasures of his own intellect and knowledge on the cenotaph thus raised to his memory. This was still more strikingly manifested some years after; when having, with great pains and labour, digested and prepared for publication Willoughby's notes for a general history of fishes, he was not deterred from his object on finding that the necessary funds, which his friend's relatives had readily contributed to the former work, were refused to this; but got it published at the Oxford Theatre, through the interest of Bishop Tell, the cost of the plates (188 in number) being defrayed by several members of the Royal Society. It may be further remarked here, though somewhat out of the course of narration, that the closing act of his life bears noble testimony to the undying strength and fidelity of his friendship: for the last work on which his indefatigable pen was employed was the digesting (with copious additions by himself, as usual) of Willoughby's investigations in entomology; which work was published after his death by his friend Dr Derham, at the expense of the Royal Society.

But to return from this digression. Ray's application to study, severe as it was, was not so absorbing as to leave him no time for the indulgence of the social affections; and perhaps his recent bereavements, though borne, as his correspondence testifies, with the resignation of a Christian, took such support from a heart, 'like a tendril accustomed to cling,' that he was the more induced to seek for some other object round which to twine it. In the year 1673 he married Miss Margaret Oakley, of Middleton Hall, by whom he had three daughters. This lady is said to have afforded him considerable assistance in the education of his pupils, by superintending their lighter studies, and thus leaving him more leisure for those sterner labours in which he took so much delight.

The death of Mr Willoughby's mother in 1676 lost him his pupils, and occasioned his removal from Middleton Park; a place no doubt endeared to him by many associations. After a short residence at Sutton Cofield, he removed to Falbourne Hall, Essex; and finally, on the death of his mother, to Black Notley, his birth-place, which he had left the unknown and unfriended blacksmith's son, and to which he returned the friend and companion of the most distinguished literati in Europe—himself decidedly the first man of his day in several branches of science, and the founder of the one which he most esteemed. He was one, however, who loved science for herself, and not for the laurel with which

she wreaths her favourite sons; and he came home, not to enjoy the *otium cum dignitate*, but to give himself up wholly and exclusively to the study of natural philosophy. The effect of his being now enabled, as Lord Brougham forcibly says, 'to be a whole man to the subject,' was soon apparent. Volume after volume issued from the press, with a rapidity which showed that advancing years had noway impaired his old habits of diligence; while the care manifest in their preparation, testified that he was still as laborious as in his earliest days. Correctness and precision indeed—invaluable qualities in pursuits like his—seem to have marked his whole progress. The Rev. Gilbert White (himself a man of science) calls him 'the only describer who conveys some precise idea in every term or word, evincing his superiority over his followers and imitators, in spite of the advantage of fresh discoveries and modern information'; and Sir J. E. Smith, in the 'Transactions of the Linnean Society,' says, in a corresponding spirit, 'If the clearness and precision of other writers had equalled his, he would scarcely have committed an error. It is difficult to find him in a mistake or misconception respecting nature.' Those only who have had some experience of the patience and labour inseparable from works of such a character, can have any conception of the value of this praise.

An examination, or even a detail of his scientific labours, during his seclusion at Notley, would be both too long and too abstruse for our pages; and even a list of his works would form such an array of 'words of learned length and thundering sound,' as would be likely to fright the general reader to the next article. We may observe, however, that to him eminently belongs the praise of having rescued the science of botany from obscurity, and laid the foundations on which the present noble superstructure has been reared. The mode of classifying plants, now universally received as the system of Jussieu, is entirely based on the researches and suggestions of Ray; and in adverting to his eminence in another walk of science, Cuvier (no mean authority) says that his works 'may be considered as the foundation of modern zoology, for naturalists are obliged to consult him every moment.' It is not to detract from the deservedly high reputation of Linnæus, to say that he has been greatly indebted to his illustrious predecessor, for he has himself readily acknowledged the obligation; and it is not saying too much to affirm that, but for the indefatigable exertions of 'the father of botany,' as he has been justly called—exertions which no difficulty could daunt, and no amount of labour tire—it may be more than doubted whether it would have attained to the perfection in which we find it at the present day. It is easy to colonise and cultivate a land which previous sagacity and enterprise have discovered.

We have mentioned that Ray always lamented the circumstance which had driven him from the ministry; and in reviewing his college exercises, it struck him that, though he was debarred from conveying religious instruction through the pulpit, the press was still open to him, and offered even a wider field for his exertions. The fruit of this thought was the noble work on the Creation, of which we have already had occasion to speak, and which has made his name loved and honoured by many who neither knew, nor could appreciate, his abstruser claims to eminence. He says himself, with reference to it, 'Not being permitted to serve the church with my tongue in preaching, I know not but that it may be my duty to serve it with my hand in writing; and I have made choice of this subject, as thinking myself best qualified to treat of it.' His discourses on the chaos, creation, deluge, and dissolution of the world, stand deservedly high, and exhibit his usual erudition and research. His prayers and devotional exercises are likewise highly valuable, not only for their intrinsic merit, but as exhibiting, to use the words of a late talented biographer, 'a mind deeply imbued with Christian principle, and accustomed to re-

cognise the beneficial appointments of a presiding Power in the most trivial as well as in the most important incidents to which our nature is liable.' To a mind so constituted, the advances of disease were but opportunities for the perfecting of that patience and resignation which had been always so conspicuous, and the symptoms of decay but friendly admonitions that the fine edge of the blade must at length wear away the scabbard. A complication of disorders, which had long sorely tried his naturally delicate constitution, at last terminated his useful and amiable life, on the 17th of November 1705, in the seventy-eighth year of his age. The following touching letter, addressed from his death-bed to his friend Sir Hans Sloane, and published in his posthumous correspondence by Dr Derham, shows that he died as he had lived:—

'Dear Sir, the best of Friends—These are to take a final farewell of you as to this world. I look upon myself as a dying man. God requite your kindness, expressed anyways towards me, a hundredfold; bless you with a confluence of all good things in this world, and eternal life and happiness hereafter! grant us a happy meeting in heaven!—I am, sir, eternally yours.'

The eulogy of Ray has employed many eminent pens; for few have traversed any part of the field of botany without pausing on their way to pay a passing tribute to him to whom it owes so much. But his character as a philosopher and a man has perhaps never been drawn with at once more conciseness and elegance than in the Latin inscription on his tomb by the Rev. Mr Coyte, of which a translation is given below. The panegyric of epitaphs has generally a fulsome quality which rather revolts than pleases; but it was the rare happiness of this great naturalist and Christian, that envy cannot look upon his portrait, finished as it is, and point to the part where a feature is too prominently drawn, or a tint too highly coloured.

'The mortal remains of John Ray, M.A., are deposited in this tomb; but his works are confined neither to one spot nor to one nation; and his fame, everywhere illustrious, will render his name immortal. He was formerly of Trinity College, Cambridge, and a Fellow of the Royal Society of London, to both of which learned bodies he was a distinguished ornament. In every science, whether human or divine, he rose to eminence; and, like Solomon, explored nature from the cedar to the hyssop, from the largest animal to the minutest insect, from the mines in the bowels of the earth to the plants growing on its surface. He discovered much which had escaped the notice of others, and brought to light many things to which mankind were strangers. He was learned without pedantry, pious without bigotry, not distinguished by illustrious extraction, but sublime in genius, modest and lowly in disposition, and eminently conspicuous in virtue. Indifferent to wealth and rank, he chose rather to deserve than to possess such distinctions. He grew old in the practice of religious duty, and the latest ages of posterity will venerate his name.'

As a testimony of the high sense which the scientific world of the present day entertains of his merits, and as a gratifying proof that in the republic of letters the highest point of distinction is open to the lowliest, and that a Burns may win and wear what a King James vainly strives to reach, we may mention, in concluding this notice, that on the 29th November 1828, a hundred and thirty of the leading savans of England, with Davies Gilbert, the president of the Royal Society, at their head, sat down in Freemason's Hall to celebrate the birthday of the son of the obscure blacksmith of Notley, and felt themselves honoured in so doing; and that a society, bearing his name, and devoted to the objects which he had most at heart, is now paying a higher and more appropriate tribute to his memory than words or marble could convey. The applause of men is not of itself an object worthy of inciting the energies of genius; but it is pleasing to see those who have themselves travelled far in the kingdom of science, prompt

to acknowledge their obligations to the bold and skilful pioneer, who, if he did not make a Macadamised road through the forest, at least cleared a fair path where before was only a tangled and trackless wilderness; and pointed out, with consummate judgment, the proper direction in which the future highway should run.

SWAIN'S POEMS.*

MR CHARLES SWAIN is distinguished among the poets of the day for grace and elegance rather than force, and the announcement of 'Dramatic Chapters' from such a Muse excites but little expectation. In fact, the title, like most titles, serves only to mislead; and we fancy him timidly feeling his way, like Barry Cornwall, through detached scenes, which, if successful, are to lead, in some future work, to a regular drama. The chapters, however, turn out to be a continuous story, told in dialogue, differing only from tragedy in its inattention to conventional rule, while the grace and elegance hitherto characteristic of the author are not unfrequently drowned in a somewhat more questionable vehemence. The experiment is so far successful, that it shows the existence of power; but although possessing, therefore, the necessary versatility of talent, Mr Swain has not done himself justice in the plan of his work. His canvas is too large, his characters too many, his details too multitudinous. He is ruined by his own riches, and overwhelmed by the excess of those materials which he intended for a monument of art.

This is our judgment, however, of the work in its entirety as a dramatic narrative; but it is impossible to deny the praise both of beauty and energy to detached scenes. We might fill more than one of our pages with quotations which would gratify our readers; but we prefer sending them to look at the edifice, to presenting them with a few bricks.

There is another department, however, of this elegant volume—elegant in paper, print, and binding, as well as literary matter—from which we are not excluded by a similar consideration. Selection from the poems and songs, which fill one half of the volume, is difficult, for no other reason than that they are *all* graceful, *all* beautiful; and our choice of this one as a specimen, is determined in some measure by its want of the poetical charm which is so rife in all the rest, but is here supplied by a simplicity and kindness that are far better.

BETTER THAN BEAUTY.

My love is not a beauty
To other eyes than mine:
Her curls are not the fairest,
Her eyes are not divine:
Nor yet like rosebuds parted,
Her lips of love may be;
But though she's not a beauty,
She's dear as one to me.

Her neck is far from swan-like,
Her bosom unlike snow;
Nor walks she like a deity
This breathing world below:
Yet there's a light of happiness
Within, which all may see;
And though she's not a beauty,
She's dear as one to me.

I would not give the kindness,
The grace that dwells in her,
For all that Cupid's blindness
In others might prefer!
I would not change her sweetness
For pearls of any sea;
For better far than beauty
Is one kind heart to me.

To this we add another of a totally different kind; and to those who are unacquainted with the writings of Charles Swain, both of these pieces in their union will

* Dramatic Chapters, Poems, and Songs. By Charles Swain. London; Bogue. 1848.

abundantly account for the peculiar reputation he enjoys among 'the gentle and the good.'

MORTALITY.

The house is old, the house is cold,
And on the roof is snow;
And in and out, and round about
The bitter night-winds blow:
The bitter night-winds howl and blow
And darkness thickens deep;
And oh, the minutes creep as slow
As though they were asleep!

It used to be all light and song,
And mirth and spirits gay;
The day could never prove too long,
The night seemed like the day!
The night seemed bright and light as day
Ere yet that house was old;
Ere yet its ead roof was gray,
Its inner chambers cold.

Old visions haunt the creaking floors,
Old sorrows sit and wail;
While still the night-winds out of doors
Like burly balliffs rail!
Old visions haunt the floors above,
The walls with wrinkles frown;
And people say, who pass that way,
'Twere well the house were down.

A WORD ON CARLISLE.

CARLISLE, the most northerly English town on the western marches, has always possessed some historical interest, at least to Scotsmen, whose ancestors so frequently battled against its walls; nor is the place unimportant as respects either population or manufactures. Occupying a slightly-rising ground at the head of a verdant meadow, which ascends from the south bank of the Eden, the situation of the town seems to be all that could be desired in point of beauty or salubrity. It is on this last particular we desire to say a few words.

Within the last twenty years, the rate of mortality per annum in Carlisle used to be estimated at 1 in 54 of the inhabitants. This showed that the place was among the healthiest in the kingdom. By a late calculation (1841), the mortality was 1 in 39, a rate actually higher than that of the fifteen unhealthiest counties. As the general average standard of mortality throughout England and Wales is two per cent. per annum, or 1 in 50, it is evident that Carlisle, with its rate of mortality (1 in 39), must in late times have lost its character for salubrity.

If this be a truth—and copying it from a locally circulated report, we have reason to believe it to be correct—the cause of so unpleasant a phenomenon is worthy of inquiry. That

'The sun shines fair on Carlisle wa,'

—or would shine, if any wall remained—as it used to do in the days of Border chivalry, need not be doubted; the Eden rolls past as clearly as ever on its way; the grass of the environing meadows grows as luxuriantly, and the flowers of the sunny banks blossom as sweetly, as they did a century ago. Besides all this, the walls and gates of the city have been removed; and there is nothing like the appearance of unhealthiness in the principal street, along which, until the days of railways, travellers were driven through the town. What, then, in nature or art, has occurred to lower the value of life? That is the great question; and startled at the turn things are taking, the more active-minded of the inhabitants have formed themselves into a Sanitary Association, with the view of collecting facts and suggesting means for restoring Carlisle to its former healthy condition. From the report drawn up by the committee of the association, it appears that they had no great difficulty in discovering the cause of the disorder which affects their community.

Everything done by nature to purify and adorn the town has been outraged. Thinking only of business, or some other material interest, the people here, as everywhere else, have totally overlooked the fact, that certain physical conditions are indispensable to insure health and longevity—plenty of pure air, sunshine, and water. The social arrangements by which these bounties of nature are abused are of the usual appalling character. The report before us speaks of the shocking scenes of dirt, disease, and wretchedness revealed by a visit to the back courts and lanes throughout the different wards. We read of imperfect paving and

sweeping; overcrowded dwellings; pigsties, dunghills, and stagnant pools, the receptacles of every kind of filth; dilapidated premises; the impossibility of depicting in words the abominable nuisances existing in one of the wards; the general faultiness of drains; and so on. Disease is traced to one or more of these causes. At the east end of a street, where filthiness and an offensive effluvia are observable, there is a 'frequency of sickness.' At the west end of the same street, 'where fifty-seven families (306 people in all) reside in whitewashed and otherwise clean houses, which are carefully inspected by the proprietors twice a year, only one case of fever occurred during last autumn.' In another street, 'where, in some of the lodging-houses, twenty people are living in one room,' which is adjacent to various nuisances, 'fever has found numerous victims.'

The committee by whom the report is drawn up specify various improvements which it is exceedingly desirable should be made—better draining, paving, and sweeping, the whitewashing of lanes and dwellings, the erection of public baths and wash-houses, improved construction of houses for the humbler classes, &c. They likewise advert to the crowded state of the churchyards in the centre of the town as being very objectionable, and state that a public cemetery beyond the suburbs is imperatively called for. From what we have seen of Carlisle during occasional short visits, we should say that all these reforms are much wanted, and ought not to be delayed. Something more, however, is required; and from the interest always taken by us in Carlisle, we venture to specify them. Since there are to be improvements, let all be done at once, or at least provided for by the same act of parliament.

There is a very stupid-looking mass of building, worse than Middle Row, Holborn, at the centre of the main street. (What town is not afflicted with street cumbrances of this sort?) We would have the whole of this removed; and, if need be, a proper and creditable-looking market building erected near the spot. The entrance from the north into this street requires widening, with a graduation of the ascent from the bridge across the Eden. At present, the banks around the castle are in a shameful condition—an ill-kept walk at top, and a misamatic ditch at bottom—the approach to the walk on the south very bad, and that on the north little better. The purloins of a thoroughfare in this quarter, called Finkel Street (the Swedish name for whisky, and therefore perhaps appropriate), are not well spoken of in the report. By opening up the entrances to the castle banks on both sides, and making a few other improvements, taking in perhaps a portion of the adjoining meadow, what a charming spot—what a scene of healthful out-door recreation might this be made! We are sure that the Board of Ordnance, which probably has something to say in the matter, would not object to the execution of a project of the kind. Many other changes for the better might be pointed out in this venerable city, were this the proper place for doing so. With so many beautiful and airy spots in the neighbourhood, we soon expect to hear that suburban erections are superseding the crowded and unhealthy dwellings in the town. A hope may also be expressed that the street at the entrance to the Caledonian Railway station will be adorned in a way befitting that great concern. Railways are evidently about to work some important alterations on Carlisle. Four lines centre in the town, and connect it with all parts of the United Kingdom—a circumstance worthy of putting mettle into its citizens. It is a good sign, at least, that a Sanitary Association has begun to stir up the question of local improvement. There will of course be objectors to anything being done, some from laziness, others from self-interest, or from prejudice. All, however, can be made to understand that death is no dainty visitor, but snatches its victims in an unpolite and very indiscriminate sort of way. Mortality risen to 1 in 39 is an unpleasant fact for fireside consideration; while the increasing burden of poor-rate, caused by orphanage and widowhood, is an argument requiring no eloquence to enforce.

Since writing the above, we learn that several of the smaller towns in Cumberland, such as Wigton, Penrith, Brampton, &c. are beginning to move in sanitary reform—an evidence of the growing interest on this important subject.

THE TWO CITIES.

EDINBURGH and Glasgow, placed at opposite sides of Scotland, yet within an easy distance of each other, have always maintained a difference of character, as remarkable as the diversity of their history. Glasgow is the older town of the two, if we reckon from the date of the small Roman settlement on the spot; but it was not till the sixth century, when St Mungo planted a religious establishment, that the place was anything more than a rude hamlet. About the time when this pious ecclesiastic founded Glasgow, Edwin, a Northumbrian prince, built his fort or burgh on the rock on which Edinburgh castle now stands, and thus gave a beginning to what afterwards became the capital of Scotland. While Edinburgh, in every stage of its early career, was associated with the history of kings and parliaments, Glasgow, on the other hand, was indebted to the fostering care of bishops: it was for ages the seat of an important see—the archbishopric of Glasgow, whose jurisdiction was extended over the greater part of the south of Scotland. A bishop built its cathedral; a bishop (Joceline, about 1172) gave it burghal privileges; a bishop, under a royal charter, gave its burghesees permission to trade with distant parts of the country; a bishop (William Rae, about 1350) built for it a stone bridge across the Clyde; and a bishop (William Turnbull, in 1452-3) founded its college. During the convulsions in the sixteenth century, all this was of course forgotten, and no town more fervently embraced the principles of the Reformation—though, to do the trades of Glasgow justice, they had the good sense to save their cathedral from the savage attacks of the iconoclasts, who swept the country of all that was valuable in architectural ornament.

In the latter days of the Stuarts, Edinburgh clung to a falling cause, in recollection, possibly, of what the old monarchy had done for it; while Glasgow, always more democratic, hailed the Revolution, and its citizens were among the first to congratulate William of Orange on his auspicious assumption of the sovereign authority. An equestrian statue of William at the Cross of Glasgow, and a similar monument of Charles II. in the Parliament Square of Edinburgh, remain as substantial tokens of this diversity of political opinion. Differing as to the Revolution, both cities agreed in their dislike of the Union with England in 1707. We can understand the disconsolateness of Edinburgh on this occasion, for it lost its importance as a seat of legislation, and its chief aristocracy fled to London; but the rioting in Glasgow, for the purpose of nullifying the articles of confederation, is unaccountable. Little were the people aware of the immense advantages which their city was to derive from the Union. Hitherto confined in their trading operations, the merchants of

Glasgow had now thrown open to them the commerce of the English colonies, in which they were not slow to participate. Awakening to the advantages presented to them, they seized with proper avidity on a share of the lucrative trade with Maryland and Virginia, to which they soon made large exports of native manufactures, bringing home cargoes of tobacco and other articles in return.

From this period—the first quarter of the eighteenth century—Glasgow gradually rose in importance, wealth, and population. One thing after another gave it an impetus—every fresh adaptation of enterprise bringing up, as it were, a new crop of successful speculators, to be the founders of families of wealth. Thus to the early patrician class formed by the tobacco-ocracy—to use a jocular coinage—were afterwards added the cotton-ocracy, the sugarocracy, the machinocracy, and lastly, we believe, the steamboatocracy. While these aristocracies of wealth were coming into existence, the aristocracies of rank in Edinburgh were vanishing from the stage, leaving the town to struggle on with its local trade, its law courts, its university (a creation of James VI.), and such national institutions as had been indulgently left it. The Union was a ruinous blow, from which the capital did not recover for fifty years, and even yet the effects are palpably apparent. It recovered, however, so far, that the scheme of a new town, for increased accommodation, was projected in 1767, and has since been executed. Those who have seen the New Town of Edinburgh, built of fine sandstone, and united by bridges with the Old, need not be told of the vast improvement which this has effected in the ancient Scottish capital.

Strange to say, the growing elegance and commodiousness of modern Edinburgh have failed to retain the favour of the aristocracy. The change in this respect is worthy of remark. In the Canongate, a street in the Old Town near Holyroodhouse, there still lived during the early part of the reign of George III., though perhaps not all at one time, two dukes, sixteen earls, two countesses, seven barons, seven lords of session, and thirteen baronets, besides many other persons of distinction. In the present day, all the peerage having houses for residence in Edinburgh may be summed up in two or three names. The Scottish aristocracy now either live continually on their estates—to which there can be no objection—or flee off to London, where competition with a more wealthy body of nobles is too frequently attended with unpleasant consequences. At all events, Edinburgh sees nothing of them, except as birds of passage: it sees even little of their money, for the more valuable articles they require are usually ordered from the English metropolis. No wonder that London has overgrown itself, pampered with the wealth—we might almost say the plunder—of three kingdoms, for

the capitals of two have been sacrificed to its aggrandisement.

Deserted by the court and higher classes generally, Edinburgh has, nevertheless, been able to maintain some of the essential appearances of a capital, and to keep progress with the steadily-improving condition of the country. Defrauded as it is through the operation of the centralising principle, there can be no doubt that its resources at the present moment are incalculably greater than they were at the Union, and much greater than they were seventy years ago, when a considerable number of men of rank still lingered within its precincts. The banking establishments and insurance offices alone are a marvel to those who know what extraordinary exertions were made by the whole kingdom to get together £1,000,000, as the capital stock of the Bank of Scotland in 1696. As a centre of operations connected with money and lauded property, the town has long exerted an influence which extends to the remotest provinces; as a centre of law and education, it has been still more unrivalled in its attractiveness; and as a centre of ecclesiastical functions, on which much of the Scotch mind is expended, its doings furnish a subject of talk from the Borders to the Northern Ocean. All these things together, along with its traditional fashionable character, have contributed to render it an agreeable place of residence for persons of unostentatious desires, with little to do, or who take delight in enlightened and refined society. Besides a considerable number of families of property, the bulk of the more elevated portion of the population are lawyers practising in the Supreme Court, the bar of which, as is well known, has furnished Westminster with a few of its most brilliant ornaments. The Scottish law bodies—advocates and practitioners of every class—are noted for their highly honourable character, as well as for a certain acumen, arising perhaps in some degree from national peculiarities, but also from a course of practice which involves both law and equity. What with these various bodies, professors connected with the university, and a few persons who confine themselves more expressly to literature, society in Edinburgh may be said to possess attractions not equalled out of the Metropolis. To be sure there is not a little effort in many cases to maintain appearances on comparatively slender means; but it may be doubted whether meagreness of fortune, with self-respect, is more fairly liable to derision, than the devotion of wealth to mere purposes of vulgar extravagance.

From the nature of its society, its libraries, its tranquillity, and the absence of manufactures, Edinburgh offers a favourable field for the cultivation of literature and the business of publishing; yet such are the absorbing attractions of London, that the dispositions of the Scottish capital in this respect have continually to battle with a rival, against which it is no easy matter to make head. Commencing only about seventy years ago with the works of Hume, Blair, Robertson, Mackenzie, and other luminaries, the literature of Edinburgh reached a culminating point in the productions of Jeffrey and Scott, and in the encouragement offered by two publishers—Constable and Blackwood—both men of tact and enterprise. From the possession of only a few hand-presses towards the end of last century, the business of printing has increased so greatly, that with the kindred arts of engraving and lithographing, it has become the leading occupation in the town. Compared with the feeble efforts of not many years back, the preparation of literature may be said to be now a staple business, for it engages nearly a dozen large establishments, each having from two or three to ten printing machines moved by steam power, and the whole pouring out a quantity of books, pamphlets, and periodicals second in amount only to that of the Metropolis. Latterly, while the mechanical means of production have been improving, the literary power, it is to be feared, has been diminishing in energy. It certainly argues little for northern enterprise that the 'Edinburgh Review' should have

become the property of a London house, and should be now edited and printed in England; and also that Edinburgh should be as unable to retain its best writers, as it is to keep its medical practitioners and artists from finding their way across the Border. It is a curious fact, with which we are intimately conversant, that a considerable portion of the literary material which Edinburgh fashions into shape, and renders acceptable in its periodicals, is drawn from distant parts of the United Kingdom; comparatively little is contributed by the rest of Scotland—scarcely anything by Scottish women—excessive absorption of mind in church matters being apparently fatal to the lighter graces of literature.

Perhaps better things are in reserve. Already there is an appearance of relaxation in Scotland from the pursuit of material interests and the hardening influence of sectarian polemics. Of late years, a taste for the fine arts has made a most gratifying progress. It is no longer considered sinful to manifest a love for pictures; nor is it of the nature of heresy to build a church in a style superior to a barn. Within the memory of middle-aged persons, there were only two or three portrait-painters in Edinburgh; and public exhibitions of works of art were unknown. There was, however, an excellent school for drawing, supported by funds belonging to the country at the Union. This academy was the beginning of the fine arts in Scotland: it educated Wilkie, Allan, and all the great artists. Latterly, the profession, greatly increased in numbers and importance, have become an incorporated body, under the title of the Royal Scottish Academy. Its leading members—Gordon, Harvey, Hill, Macculloch, Steele, Duncan, and others—have acquired a widely-extended reputation. Of their annual exhibitions, so well known, it is unnecessary to say anything, further than that they have helped to raise the tone of feeling in Edinburgh, and elevate its character as a capital. The scheme of a national gallery for the reception and permanent exhibition of pictures from the best masters, is at present in the way of being matured—of course from local resources. We should like to see added to this a national museum, the repository of all that is interesting in the mineralogy and natural history of Scotland, as well as of works of foreign and ancient art. It is not easy, however, from the numerous demands on benevolence and public spirit, to see how such an institution could be realised, and we fear it is hopeless to look for a share of those grants which are voted from the public purse to support the National Gallery and British Museum. At the same time, the English people are too generous not to allow that the present practice in this respect is neither just nor creditable; and that the Scotch, bearing their equitable share of taxation, are entitled to a proportional share of annual subsidies for the improvement of taste and encouragement of the arts.

We now return to Glasgow, which, within the last thirty years, has completely outstripped Edinburgh in point of wealth and population. The rapid and steady increase of this city is indeed one of the most remarkable things in modern British history. At the Union, its population was no more than 12,766; in 1790, it was little above 50,000; it is now upwards of 300,000; and this increase is imputable exclusively to the industry and enterprise of its inhabitants. The active-minded from all parts of Scotland are attracted towards its factories and counting-houses; and in comparison with the continued bustle of its streets, Edinburgh looks almost like a desert. From the total difference of character in the two cities, anything like rivalry, as may be supposed, is out of the question. Little more than forty miles apart, and now united by two railways, a continual stream of intercourse is kept up between them; greatly to their mutual satisfaction and benefit.

Destitute of the picturesque, from the nature of its situation, Glasgow is as well built as Edinburgh, its

houses of all kinds being also formed of a durable sandstone, which imparts an air of substantiality and elegance. Unfortunately, the vast clouds of smoke which issue from numerous factory chimneys give a dinginess to the atmosphere, and detract considerably from the general appearance of the town. Glasgow has its full share of the social incongruities for which the present age is remarkable—vast fortunes and luxurious houses in one district, masses of poverty and misery in another. Perhaps in no city in the world are the observances of religion respected by a larger proportion of the population, or practised with more unequivocal earnestness, than in Glasgow; in this respect, it presents the national character of past ages much more faithfully than Edinburgh. At the same time, philanthropic inquirers have to deplore in Glasgow an astounding amount of what may well be called opposite influences. It was found a few years ago that there were as many as 1393 licenses to sell spirits given out in this city, being one for every fourteen families! This may be of course regarded as the exponent of a vast amount of sensual and vicious indulgence, as affecting certain classes of the population. It represents the misfortunes of the multitude, and, partly, the lack of legitimate and ostensible means of amusement for the great body of young men necessarily amassed in such seats of industry. Great efforts have been made of late years to correct the evil—we must hope that they have been in part effectual. Among recent movements is the establishment of an Athenæum, after the model of the Manchester institution of that name, offering a reading-room, and a lecture-room, or books for perusal at home, as alternatives from the club-room and the idle saunter of the streets. Prejudice usually obstructs such institutions at first, but, by perseverance, their good tendency becomes manifest. Their opponents would do well to think of them, not altogether as what they positively are, but with some regard to the gross evils for which they stand as a substitute.

What has been done to render the Clyde navigable, is perhaps the most curious thing about Glasgow. In this matter an unconquerable perseverance has been displayed. By means of dredging, digging, hemming in the tide and river way, building quays, &c. ships now reach Glasgow which formerly had to unload twenty miles nearer the sea. That which was not long ago a tranquil scene of green grass and rural imagery, is now a busy mart of shipping. There has latterly, it appears, been some carping as to what has been done, and also what has been left undone in this respect; but we agree with a Glasgow newspaper (the 'Citizen') in its reply to all such fault-finding: 'In dispassionately reviewing the management of the river Clyde and harbour of Glasgow for the past seventy or eighty years, we confess that any inclination to find fault is immediately dispelled by the pleasure and pride with which we contemplate the magnificence of the results. We have increased the tidal rise at Glasgow from eighteen inches to about eight feet. Eighteen miles of river have been rendered navigable for vessels drawing twenty feet, where formerly those drawing three feet three inches only could pass. Where formerly there were only a few fishing smacks, we have now vessels of the largest class, trading directly with all the nations of the earth. We have raised the tonnage and other revenue from L.147 (seventy years ago) to L.65,000. Instead of L.460 (in 1800), we now return to the government a customs revenue of L.659,834. All this has arisen from local management of our river and harbour; and we must add, that it is for the most part owing to the exertions and enterprise of the River Clyde Trustees, that in a small and mountainous country, with a scattered population of two and a half millions, with an unkind climate and ungenial soil, a city has been reared, the ratio of whose increase in wealth and population no city in the old world can parallel, and which is only equalled by the largest *entrepôt* of the United States—the city of New York—in the new.'

In one thing the histories of Edinburgh and Glasgow agree—each has been left to its own resources by government. What has been done has been self-creative. The Union has been doubtless beneficial to Scotland, if it were from nothing more than the internal tranquillity which it secured; but it is worthy of grave inquiry, whether superior advantages might not have been achieved by a federal instead of a legislative union? The belief is daily gaining ground that a federal compact would have been preferable; because, while it insured the same cordial intimacy and reciprocity of privilege as now subsists between England and Scotland, it would have allowed the Scotch to manage their own affairs, which, it is judged, would have been somewhat more pleasant and satisfactory than being obliged to transfer the work to a city four hundred miles off, there to be cared for by parties who, to all appearance, are burdened with six times more business than they can properly get through. Stupid as this arrangement is now felt to have been, as if to make matters worse, it has been the inexplicable policy of the last twenty years to abstract institutions from Scotland, and carry them to Westminster, where they are intermingled with the local affairs of England. Against this provincialising of Scotland we make a deliberate protest; not so much from its injury to Edinburgh, as the indignity and injustice of the whole proceeding with respect to the nation. We must put English functionaries right as respects the relative position of Scotland. It is not a province of England, but a kingdom which, by treaty, is insured a certain distinct and independent character. As nothing, as far as we are aware, has occurred to render the articles of Union waste paper, it ought not to be robbed piecemeal of every board for conducting its affairs, nor be unnecessarily exposed to the intrusion of freshly-created imperial institutions. There is the more need for speaking emphatically on this subject, that while we now write, a scheme, it seems, is on foot for transferring the whole management of the harbour and river of Glasgow to a board of some kind in Whitehall. The honest Glasgowegians may well be surprised at the fancy of relieving them of a duty which they feel themselves competent to undertake, and by their performance of which fifteen thousand vessels are enabled to reach the Broomielaw annually. Against this centralising project we hope an earnest remonstrance will be made. The Clyde, surely, can be better looked after on its own banks than on the banks of the Thames.

W. C.

CURIOUS HISTORY OF A SAILOR.

AMONG the group known as the Caribbean Islands, there is a little spot—in a great atlas, scarcely so large as a pin's head, and in reality a mere dot in the waters which sweep around it—called Sombrero, a naked, desolate, barren, miserable lump of rock, the resort of the sea-gull, the occasional playground of the turtle, and the scoff of the great billows of the Atlantic, which hurl their unwieldy bodies against it, as if it would take a very little to induce them to swallow it up altogether. However, the little island, with its territory embraced by a periphery of a mile and a half, has long kept up a gallant resistance, taking in obdurate sullenness the attack of the waves, which appear to be for ever gnashing their white teeth against its rugged sides. Sombrero offers a striking exception to the character of the surrounding islands: it possesses no alluvial soil, no refreshing rivers, or brooks, or springs, no verdant vegetation; nothing, in short, to invite or to favour the residence of man, or to excite anything beyond the incidental notice of the passing vessel. His Majesty's sloop of war, the *Recruit*, on the 13th December 1807, was standing towards this unpromising spot, on which the first act in our drama opens. It was Sunday afternoon, and as the day closed

in, the island lifted its head, lonely and melancholy-looking at all times, in dusky obscurity above the waves, and looked out upon the ocean, if possible, even in gloomier solitude than ever. The Recruit was now about a mile and a half off shore, when, between five and six o'clock in the evening, Captain L—, her commander, came on deck, having just risen from dinner, with a face flushed with wine, and a quick impatience of gesture which portended evil to some one on board. Giving a rapid glance at the dim mass of rock now so near, he hastily summoned the master, and asked, 'What island is this?'

'Sombbrero,' was the reply.

'Have we not some thieves on board?'

'Yes, sir, there are two,' answered the master, somewhat startled.

'Send up my pistols,' said the captain.

The pistols were accordingly brought up, and after undergoing a careful examination as to their condition for service, were ostentatiously laid on the capstan.

'Now send the ship painter here with a strip of black tarpaulin, and his paint and brushes.'

The master hurried down to execute this strange order, while the crew forward were gathered into little knots, each inquiring of the other what all this could mean. Presently the painter appeared with his tools and the piece of canvas in his hand.

'Take your brush and paint the word "THIEF" on that piece of canvas; paint it in large letters!' exclaimed the captain.

With a hand not altogether the steadiest, and, under the fierce eye of the commander, not improving in steadiness, the man proceeded to his task. The five letters of shame soon, however, glared from the canvas; and although not exactly conspicuous for perpendicular and rectangular accuracy of outline, they were plain enough for the purpose; and after completing his work, the man gladly received permission to go below.

'Now send Robert Jeffery up here; lower the ship's boat, and let her crew get ready to take her off to the shore yonder,' shouted the captain, who had already worked himself up into a towering passion.

Robert Jeffery, a lad of eighteen, soon came on deck, little dreaming of the terrible sentence he was about to receive. He was dressed in a blue jacket and trousers, and he held his hat in his hand, but he had neither shoes nor stockings. Giving a significant glance at his pistols, the captain said to him—'Jeffery, do you see that island? I am going to land you on it.'

The poor fellow looked astonished, but dared not offer any remonstrance; and was effectually prevented from resisting the cruel order, by being immediately hurried over the side of the ship, and seated in the boat's stern, with the lieutenant and the boat's crew. He was allowed no time to collect his clothes. 'Never mind his things,' thundered the captain to one of the men who was endeavouring hastily to gather together a few necessary articles for the lad. He was cast out of the ship without provisions, without shoes, without a covering beyond the clothes he wore; and in this destitute condition he was rapidly rowed ashore, half-stupified at the suddenness and severity of his fate. Upon his back was sewn the strip of canvas which published his crime. The lad was naturally of a weak, nervous, retiring temperament, and had always been somewhat of a skulker on board. His feelings now overwhelmed him, and he continued crying bitterly until the boat reached the shore. As they drew nearer the island, the rocks assumed a more definite form, and a little way inland were several which bore all the appearance of cottages. On landing, the lieutenant and the boat's crew accompanied the lad ashore, and proceeded some little way into the island, to see whether or not it was entirely desert, or whether the masses which, in the duskiest of a rapidly-approaching night looked like human habitations, were really so. As they scrambled up the sharp rocks, poor Jeffery's unprotected feet were cruelly cut, and bled profusely. One

of the crew seeing this, humanely plucked off his own shoes, and gave them to the lad; another gave him a knife; and a third a pocket-handkerchief, which he might use as a signal. As they proceeded to the house-like rocks, it was mentioned that the French fishermen occasionally resorted thither to catch turtle; so that Jeffery's hopes were sustained with the prospect of shortly getting shelter and food. On arriving at the rocks, how bitterly were these hopes disappointed! It was now quite dark, and became therefore necessary that the crew should immediately return to the ship. Leaving Jeffery on the desolate rocks, after bidding him a hasty farewell, they got into the boat, and were soon at the ship's side. The boat was hauled up, and the Recruit made all sail from the spot where she had left one of her men to perish. This transaction took place at a little past six in the evening. The captain shortly afterwards went down to his cabin; and poor Jeffery 'embraced the rock for shelter.' As the wind came in fitful breaths upon the ship, mingled with the murmur of the surf, the crew of the Recruit more than once fancied that they heard the lamentations and cries of their unhappy mate. Soon after the wind died away altogether, and nothing was heard beyond the idle splash of the waters against the ship's side, and the far off and incessant sounds of the conflict between the waves of the Atlantic and the rocks of Sombbrero. The night passed away: at six the following morning, the ship was still in sight of the spot; and many were the conjectures of her crew as to the probable fate of Jeffery. He could not be discerned by them from the deck. Between eight and nine the captain made his appearance; and the officer of the watch, in the hope of inducing him to send off a boat for Jeffery, reported that Sombbrero was still in sight. But he was inexorable. Strong fears were now entertained that if the lad did not perish from hunger and thirst, he would fall a victim to the wild birds, which were both large and numerous there. None of these things, however, moved him; and having ordered all sail to be made, the Recruit, under the impulse of a brisk wind, bore off rapidly to the northward.

Leaving Jeffery to his fate, let us follow the ship. Directing her course to Barbadoes, she there joined the admiral's squadron. But the hard-hearted act of her captain being whispered about, it at length came to the admiral's ears, and he, after severely reprimanding him for his cruelty, commanded him immediately to return and look for the man. Two months had passed since he was set on shore, when the Recruit again hove in sight of this melancholy island; and now, under the sting of an avenging conscience, and the terrors of a prospective court-martial, the commander hastily despatched a boat to the shore, with the same commanding officer and men who had landed his victim, giving them urgent directions to leave no corner unsearched. On landing, they disturbed a vast flock of the birds called 'noddies,' and found near the shore a multitude of nests full of their eggs, and of young birds recently fledged, which hopped about in all directions. At this visit it was broad daylight, and now they saw to what a dreadful tomb their captain had consigned Jeffery two months previously. They searched in vain for a drop of fresh water. There were many sparkling pools as clear as crystal; but every one, without exception, was salt, and consequently undrinkable. The island had a craggy, sharp ascent; but on its summit was perfectly flat, naked, and barren, unless a little withered grass, rough and wire-like, can be called a production, and a thin coat of sand and a little detritus a covering. After a long search, nothing was discovered of Jeffery. But a rude tomahawk handle was picked up by one of the men, and to their dismay a tattered pair of trousers by another. Again and again they explored the rocks, dividing, and uniting, and searching every hole and corner; but they found nothing more. They at length returned, and reported the fruitless result of their expedition to their anxious captain; and the news rapidly

spread among the men, who, on hearing of the tomahawk handle and the trousers, were unanimous in the conviction that Jeffery had perished, and probably by a violent death. The boat was again ordered on shore, and this time the captain himself went in her: every cranny in the island was again searched, but with the same result. There was no heap of bleaching bones to indicate his death by the attacks of the birds; but the handle and the torn garment seemed to quench all hopes of his existence. What had become of him? was the universal inquiry; and a profession of utter ignorance, and of the inability even to conjecture, was the universal answer.

The Recruit again quitted Sombbrero for Barbadoes. Captain L— appeared before the admiral, and expressing a conviction, which his anxiety and fears belied, that the lad was safe, and must have been picked up by some passing vessel, the admiral was satisfied, and with a culpable willingness to forgive, suffered the matter to rest: and it rested, strange to say, for two years; but it was again to be put into agitation. A person having experienced, as he conceived, some injustice at the hands of the admiral, and being in full possession of all the particulars of the cruelty he had so lightly passed over, determined to bring it to the light. He addressed a letter to a member of parliament, the representative of his native city, and strongly insisted upon the propriety of calling a court-martial upon the captain, in order to bring the question to an issue. This appeal was sufficiently powerful to set in motion the whole official machinery. A court of inquiry was summoned, and sufficient grounds were procured for the appointment of a court-martial. This step was accordingly taken; many witnesses of the deed were examined, whose testimony proved the fact beyond the possibility of doubt; and the particulars were given with a clearness which, considering the lapse of time since the event, was remarkable, but was easily to be accounted for by the deep impression such an occurrence was likely to have made on the minds of the men. In the defence, no attempt was made to deny the fact; but it was pleaded that the lad Jeffery was of infamous character, and had proved incorrigible while on board. Nothing worse, however, than theft was brought home to the poor lad; and it remains to be seen that even this was of a character so peculiar, as in some degree to diminish its guilt. The court did not hesitate an instant in its sentence: its verdict was perfectly unanimous, and it condemned the captain to be immediately dismissed his majesty's service; and he was dismissed accordingly.

Whoever will turn to the 'Times' newspaper for February 13, 1810, will find under the head 'Court-martial' a few particulars of this singular case; and on looking over Cobbett's 'Weekly Register' about the same period, it will be seen that the public excitement on the subject was extreme. The verdict against Captain L— received the entire approbation of the country. So far an act of justice was signally rendered; but where was the victim in the meanwhile? Was he dead or alive? Had he been killed, or killed himself, or been devoured, or starved, or drowned, or rescued? Upon a motion by a popular leader in the House of Commons, further inquiries about his fate were immediately set on foot. Official instructions were forwarded to our plenipotentiary in the United States; for the report went that an American ship had rescued him. The proper steps were taken, and the result was as follows:—At a town of the name of Marblehead, near Boston, in Massachusetts, the lost Robert Jeffery was said to have been discovered. He was immediately taken before a magistrate, and being interrogated, gave the following account of himself: He stated that he was twenty-one years of age; was born in Polperro, a village in Cornwall; had been seized by a pressgang when he was eighteen, which carried him on board the Recruit; and having been brought up to the trade of a blacksmith, he was made armourer's mate on board of

her. She soon afterwards sailed for the West Indies: after a while, her stock of water ran low; the crew were allowed to a certain quantity daily; and he becoming very thirsty, went one Saturday evening to the beer cask, and drew off about two quarts of spruce beer into a bucket, drinking about three-fourths of that quantity, and leaving the remainder. On the captain discovering his theft, he was ordered to be placed on the black list. The Sunday following he was landed, by the captain's orders, on Sombbrero. He found it to be a desolate island, without any inhabitant, or sustenance of any kind to support life, and he remained on it nine days without any food, save about a dozen limpets that he picked off the rocks. At length he was rescued by an American vessel, and landed at a port in the state of Massachusetts. This declaration was signed with a cross. It was transmitted to England, and appeared at once in all the newspapers.

This, it may be thought, was the end of the matter. But far otherwise. Robert Jeffery had a mother 'yet alive.' She had perused with the utmost anxiety the declaration thus officially set forth, and she immediately addressed a letter to the public journals, which rekindled all the previous uncertainty. Therein she solemnly declares her conviction that the declaration thus made was, if not wholly a fabrication, at anyrate not made by her own son, but by some one who had been suborned to personate her unfortunate child. The most remarkable circumstance in confirmation of this opinion was the fact, that the papers signed Robert Jeffery were marked with a cross, as is usual with persons who cannot write their name; whereas it was averred that Jeffery was a good scholar, and it was unlikely that he should pretend ignorance of the art of writing. The anxious mother further added, that it was of the utmost importance to her to know of the real existence of her son, in consequence of the lease of her premises being held on the dropping of three lives, of which her son's was one, otherwise it would fall into the power of the lord of the manor. Some of the journals espoused her cause, but others affected to doubt that this letter was in reality written by her. The question was soon set at rest. A gentleman went down to her native village, found her out, and was assured from her own lips that she was the author of the letter. The village schoolmaster also bore his testimony to the fact of Jeffery being able to write a fair hand. The intelligence also came out that, when put on shore at Sombbrero, he begged some of the men who were his fellow-townsmen on no account to tell his mother what had happened to him; thus indicating a regard for her feelings which, it was urged, would surely, if he were yet alive and well, have long since induced him to write, and assure her of his safety. Public interest was now at fever heat. Mr Cobbett fanned the flame; and with his homely, common-sense questions, kept poking the ribs of the government in a most uncomfortable manner, while he stirred up an immense blaze among the people by asking, 'Is this the treatment our "jolly tars" are to expect?'—a question which, considering the popularity of the navy, greatly added to the ferment.

Matters now assumed a very serious aspect. The public appeared determined to bring by any means the whole subject to an issue, and to obtain information as to whether the lad was really dead, or was yet living. Those in authority found that it was high time to take some decisive step to decide the question; and in a short time a ship, under the command of a captain in the navy, was on her way to Boston with the necessary documents, to find out the young man, and, if living, to bring him home. This proved the climax in Jeffery's history. Some little time elapsed before the result of the mission could be known; during which, however, the interest in the young man's fate by no means diminished. And if the attention of the public had been commanded by the peculiarities of the case, how are we to describe the alternations of hope and fear which agitated a mother's anxious heart? At length

the vessel returned, to put a final end to suspense as to the man's destiny. The notice of her arrival was accompanied by the following announcement in the 'Morning Post' newspaper:—

'Jeffery, the seaman, was this day discharged from the navy, by order of the Lords Commissioners of the Admiralty. He was immediately brought on shore, and set off for London!'

Thus was this long-pending and much-agitated question finally settled by the appearance of the young man himself. A thousand inquiries were now of course put to him about his adventures; to most of which the following narrative was the answer:—

At first he was altogether unable to believe that it was intended to abandon him in that destitute condition, upon an island, which the men who brought him there knew to be uninhabited and unproductive. He thought it probable he was merely left there for the night to frighten him, yet he could not help fearing the worst, from the stern character of his captain. How anxiously he watched for the morning! how wearily that wretched night passed away without shelter, and without a second covering for his frame! The morning came, and all his hopes were confirmed on beholding the Recruit only a few miles off the shore. He sat watching her from the gray dawn until it was bright daylight; every moment he expected to see the same boat which had torn him from her, return on the welcome errand to convey him back again. Vain hope! He saw her white sails unfurling and filling out with wind, and perceived that the distance between her and the island was rapidly increasing; and then, as she became a speck on the mighty waters, then only did he give himself up to overwhelming despair, as the awful reality of his fate came home to his mind. She vanished in the horizon, and he saw her no more. For two whole days he suffered dreadfully from thirst, and deeply, though less distressingly, from the cravings of hunger. To allay the fever which consumed him, he drank a considerable quantity of salt water, which, however, only rendered his sufferings more intense. Death was now before him, when most providentially a refreshing shower of rain fell, and the quantity which remained in the crevices of the rocks supplied him so long as he remained on the island. But he was at some difficulty in drinking it; for it lay in such shallow pools, or in such narrow fissures, that it was at first perplexing how to avail himself of the precious gift. The idea at length entered his mind of sucking it out with a quill; and as the island abounded in birds, he was at no loss to find one suitable for his purpose. Inserting one end of this into the crevices, he was able to suck sufficient to quench his thirst, feeling inexpressibly grateful for this most opportune blessing. But nature now renewed her other calls upon him, and was imperative in her demands for food. How to supply this want he knew not, nor could he think of any means of doing so. He saw a great number of birds of the gull kind, rather larger than a goose, and attempted to catch some, but in vain. He then hunted for their eggs, but he could only find one, which had probably lain there for months, for it was in such an offensively putrid state, that, fainting as he was from inanition, he could not touch it. The only food he had, if it could be called food, was some bark, which he was so fortunate as to find cast upon the seashore. At length, greatly to his joy, he saw a vessel in the distance. With an exulting heart he watched her emerge, sail after sail, from the blue horizon. When her hull rose above the line, he was half wild with delight; and plucking forth his handkerchief, he waved it incessantly, every minute expecting some signal to indicate that he had been perceived. The great ship, with her load of wealth and life, took no heed of the poor outcast, and 'passed by on the other side,' at a distance too great for him to be discerned by those on board. Another and another ship hove in sight, and passed away, leaving him to his tears, and hunger, and despair. Altogether, five vessels were descried by him,

each leaving him more cast down and nearer death than before. He had now despaired of rescue; and fainting through hunger, he sank down upon the shore. But relief was at hand. An American vessel, passing nearer the island than usual, was hove to at the command of the captain, in order that he might examine the birds which were flying in great numbers around it. On landing, the men discovered our perishing seaman, carried him in all haste to the boat, conveyed him on board, and by kind and judicious treatment, speedily restored him to perfect health. He was thus delivered from his imminently perilous situation, conveyed to Marblehead, where his story excited at once the indignation and active compassion of the people, who soon supplied him with clothes, work, and wages. There he had peaceably spent this interval of time; and while England was ringing with his name, he was pursuing his humble occupation, wholly ignorant of the tumult his case was exciting at home.

Immediately on his arrival in London, Robert Jeffery became one of the metropolitan lions, and was for some time visited by crowds of persons, much to his pecuniary advantage. This publicity stimulated Captain L— to come to an arrangement, by which Jeffery should be compensated for all his wrongs, and a handsome sum was accordingly paid him, on condition of removing to his native village.

After the manner of a real romance, we must bear our hero company to the last. Accompanied by an attorney's clerk, to whom he was intrusted, he set out for home. On the road from Plymouth they met Jeffery's father-in-law, for his mother had been twice married: he immediately recognised with joy his long-lost relative; and he ran forwards to apprise his anxious mother of the speedy arrival of her son. The news flew like lightning through the village—Robert Jeffery was coming home safe and well! Before the young man reached the place, the sound of the village bells was borne to his ears, and quite overcame him. The inhabitants, old and young, turned out to meet him, and were prepared to receive him; and, says the 'Times,' in its sober account of this romantic business, 'it is scarcely possible to express the cordial greetings and exulting transports that attended his arrival.' The whole village was for the time in a commotion which it had rarely or never experienced. People who, when Jeffery was a humble workman in his father's shop, never cared a jot about him, and little dreamt of the noise he would one day make without intending it, now pressed forward and warmly shook him by the hand, congratulating him on his safe arrival in hearty expressions of welcome. After the tumult of joy had a little subsided, they began to look upon the clerk with suspicion, and to exhibit alarming symptoms of hostility against that gentleman; but Jeffery immediately assured them that he was one of his friends, and had taken so long a journey only for the purpose of protecting him. This produced a speedy revolution in the sentiments of the villagers, and their angry looks and expressions were at once exchanged for those of respect and kindness. The meeting between Jeffery and his mother was particularly interesting. At first she gazed upon him with a kind of bewildered anxiety, as if doubtful whether she could trust what she saw. Her son that was dead was alive again, 'he that was lost was found.' In a few moments she recovered herself, and they rushed into each other's arms. 'Oh, my son!'—'Oh, my mother!' interrupted by sobs on both sides, were all that they could utter for some time. At length the agitation of their feelings subsided, and a scene of calmer endearment ensued. Nothing but the safe arrival of the wonderful Jeffery engrossed the attention, minds, and tongues of the warm-hearted villagers.

In concluding this curious history, we wish we could authoritatively explain what may seem to require clearing up. We have heard that the tomahawk handle turned out to be part of a fisherman's hatchet; and it

was surmised that the tattered trousers never belonged to Jeffery at all. Perhaps the signing with a mark was the effect of momentary caprice. Beyond this, after a diligent search, we are unable to discover any explanation of the circumstances which, for the time being, produced so much perplexity. If this had been a fiction, it would have been easy to have invented a key to the lock: as it is, we leave it to our readers, with the simple assurance that the narrative, in all its particulars, is exactly as it is to be found in the newspapers of the period.

THE BLOWPIPE.

THE blowpipe, in its simplest form, is a small metal tube eight or nine inches in length, gradually tapering from one extremity to the other, so as to terminate in a very fine orifice, and bent round at right angles about an inch from the smaller end. If we place the point of this little instrument in the flame of a lamp or common candle, and blow gently through the other opening, we are enabled to produce a flame capable of raising the temperature of any small object exposed to it to a degree of heat more intense than that of a furnace.

The introduction of the blowpipe into the arts dates probably from a very distant period, having been employed, as it still is, by jewellers and workers in metal for the purposes of soldering; in which light it may be regarded as a convenient substitute for the furnace-bellows. The happy idea of extending its use into the investigations of chemistry, is believed to have originated about a century ago in Andrew or Antony Von Swab, a Swedish metallurgist and councillor of mines, who, according to the statement of Bergman, applied it to the examination of metallic ores and furnace products in the year 1738. The first person, however, from whom was derived any knowledge of the method of using the blowpipe, and of the effects produced by it, was Axel Frederick Von Cronstedt, also a Swede, connected with the mines of his country, and well known as the author of the first system of mineralogy based upon chemical principles—'A man,' in the words of Berzelius, 'whose genius so far outstripped the age in which he lived, as to be unintelligible to his contemporaries.' His system of mineralogy was published in 1758; and his quick and original mind perceived, at an early period of his researches, the combined power and utility of this little instrument in the hands of the chemist. He improved it, and applied it successfully to the investigations of minerals, making use of certain reagents or fluxes for that purpose, which are still retained, being pre-eminently superior to any that have been subsequently tried.

The illustrious Bergman contributed still further to the popularity of the blowpipe, by a treatise on the subject, which he sent to Baron Von der Born in 1777, who published it two years after, in the Latin language, at Vienna. In the compilation of this work, Bergman, on account of his ill health, was chiefly assisted by John Gottlieb Gahn, likewise a Swede by birth and immediate parentage, but of British extraction, who performed nearly all the experiments detailed in it; and who subsequently, by his laborious investigations and numerous inventions and improvements, attained in the use of this instrument to a surprising degree of efficiency, and far surpassed all who had preceded him. He is stated to have carried his blowpipe always with him, even on his shortest journeys, and to have submitted to its action every new or unknown substance that fell into his hands. During the last few years of Gahn's life, Berzelius—

now the most celebrated of living chemists*—undertook, at his request, an extended series of experiments, which the old man, still ardent in the pursuit of science, was to have controlled, blowpipe in hand; but this intention was put a stop to by his lamented death, which took place on the 8th of December 1818, in the seventy-fourth year of his age. Berzelius afterwards carried on his investigations, adding greatly, by various discoveries and new methods of research, to the utility of the instrument; and in 1820, he published at Stockholm a complete treatise on the use of the blowpipe in chemistry and mineralogy, which became at once a standard work, and was immediately translated into most of the European languages. This work has since that time passed through several editions, and may be said to have formed the basis of all that has been subsequently written on the subject. Amongst the chemists of our own country whose researches have tended to advance our knowledge of blowpipe analysis, may be mentioned the names of Dr Wollaston and the late Smithson Tennant. A very useful work, which has already entered a second edition, and been translated into the French and English languages, has also been published within the last ten years by a German chemist, Carl F. Plattner, assay master at the Royal Freyberg Smelting Works.

Having thus traced the history of the blowpipe through the principal points of its progress, we shall briefly explain the method of employing it in the investigation of unknown bodies; and the means—simple and easy of execution, and certain in their results—by which the presence or absence of the common metals, and other elementary substances of ordinary occurrence, may be at once detected in any compound presented to us. The utility of this knowledge no one can attempt to gainsay; and as a good and efficient blowpipe may be purchased, in an improved form, for a single shilling, and packed with all its necessary apparatus and reagents in a little case, which can be carried in the pocket, or placed without inconvenience in a corner of the traveller's portmanteau, it may be employed by those to whom otherwise the domain of chemistry would be a forbidden land. We would especially call the attention of all about to emigrate to, or dwelling in, the more distant colonies, to the use of this admirable little instrument; for, to such, opportunities may not be wanting for the discovery of metallic ores, or other natural productions, which, resembling, to the unpractised eye, merely so much earthy or stony matter, may be found, when examined, to be of the greatest utility. Even in a central district of Europe but comparatively a few years ago, an ore of cobalt was broken upon the roads, which has since yielded an annual revenue of many thousand pounds.

Are all the refuse substances flung aside as useless in our workshops, our manufactories, and our dye-houses, to be regarded as worthless, or nearly so? May they not yet be applied to purposes at present little dreamt of, or lead to discoveries replete with use and profit to mankind? Let the blowpipe answer these questions: no one can honestly reply to them for it; and they are at least, should they occasion but a single good result, worth, and well worth, the asking.

The form of blowpipe described at the commencement of this article has the disadvantage of letting the water, arising from the condensed breath after using it for a short time, be blown out into the flame, thereby

* Since this article was written, news have arrived in this country of the serious, and, it was feared, fatal illness of this distinguished philosopher.

causing a certain interruption or inconvenience. This is best remedied by making the blowpipe of two pieces—namely, a long straight tube (from six to eight inches in length, according to the sight of the operator), closed at one end, and rather larger in diameter at that extremity; and a shorter tube or pipe of narrow diameter, and about an inch and a half in length, fitting at right angles into the side of the long tube, by an orifice made for that purpose, at a quarter of an inch from the closed end. If to this we add two little nozzles or jets of platinum, with orifices of different sizes, to fit on to the pointed extremity of the short pipe, as may be required, we shall possess a very perfect instrument. The reason these little jets are made of platinum is, to avoid the necessity of clearing their minute apertures by mechanical means, when they become stopped up by dirt or grease; as in this case we have only to heat them to redness before the point of the blowpipe flame, to render them bright and clean again in an instant—platinum being able to withstand, uninjured, the blast of our most powerful furnaces, and therefore capable of bearing the degree of heat necessary to burn off the carbonised matter; whereas other metals would fuse, or become brittle and oxidised.

Before we can properly understand the results obtained by the blowpipe, we must become acquainted with the nature and properties of the flame to which it is to be applied. Let us take the flame of a common candle as an example, and examine its different parts, and the properties, distinct and unchanging as the laws from which they are derived, which each possesses. If we observe this flame attentively, we shall find it to be composed of three totally different parts—namely, a dark nucleus in the centre, formed by the unconsumed gases which issue from the wick, and which cannot burn for want of air; secondly, a bright luminous cone surrounding the dark internal portion; and lastly, a thin and feebly-luminous mantle enveloping the whole flame, being scarcely visible at the summit or on the sides, but forming at the base a cup-shaped portion of a dark-blue colour. In this outer surface of the flame the gases undergo complete combustion, being abundantly supplied with oxygen from the surrounding air; and it is here that the greatest degree of heat is situated. This fact may be easily exemplified by holding in the flame a thin iron or platinum wire, which will then be found to be coated with carbon or soot in the interior part, whilst it is most strongly heated at the sides or apex; and on removing the wire, the soot will be seen to disappear in passing through the enveloping surface of the flame. On forcing a stream of air, by means of the blowpipe, gently through the flame of a candle in its natural position, the relative situations of its different parts will be entirely altered. The flame itself will be deflected into a horizontal position; and oxygen, before supplied only to its external surface, will be thrown into its very centre, causing the complete combustion of the gases, which burn in the form of a long blue cone, surrounded by a pointed flame of a yellow colour. At the point of this blue cone is concentrated all the heat that before was spread over the entire surface; and the surrounding yellow flame prevents the heat thus concentrated from escaping. All metallic bodies—that is to say, small fragments of such containing oxygen—are, with very few exceptions, soon deprived of it, and reduced to their true metallic state, if they be held just before the point of the blue flame, and entirely within the yellow one. Metallic bodies, on the contrary, if held a little way beyond the flame, and strongly heated, are, with two or three exceptions, as gold and platinum, converted into the state of oxides, losing completely their metallic aspect and properties.

In using the blowpipe, the air must not be forced directly from the lungs, as such would soon exhaust the operator, besides the injurious effect that it might have upon his health; but the mouth must be filled with air, and this suffered to pass very gradually through the instrument, aided by the compression of the muscles

of the cheeks and lips, the operator breathing at the same time through his nostrils. This, which is confessedly rather troublesome at first, is rendered perfectly easy of execution after a few trials; so that, with a little practice, a blast of several minutes' duration may be kept up without the least trouble or fatigue. Substances, when exposed to the flame, are supported on a piece of well-burnt charcoal, or at the end of a thin platinum wire bent into a loop. Otherwise, they are held by a pair of tongs or forceps with platinum points; and occasionally in a narrow glass tube, three or four inches long, and open at both ends; or in one of the same length, but of larger diameter, and closed at one end, so as to form a little flask or test tube.

As it would be impossible to condense within the limits of a single article all the operations and demonstrative experiments capable of being performed by the aid of the blowpipe, and of the simple apparatus with which it is usually accompanied, we shall merely point out, by way of example, the means by which we may render evident, in the most minute portion of any compound, the presence or absence of one or two of the more common substances met with in nature:—

Sulphur occurs most abundantly in nature. It is exported, in its pure state, in vast quantities from Sicily and other volcanic districts; and it is also obtained in some localities by a process of art from certain of its metallic combinations. A great number of the metals of commerce are chiefly extracted from their sulphur compounds—as lead from *galena*, or the native sulphuret; and copper from *copper pyrites*, a compound of sulphur, copper, and iron. Sulphur also, in union with a certain quantity of oxygen, is met with in *gypsum*, consisting of sulphuric acid, lime, and water, from which the plaster of Paris is made; likewise in *alum*, and in numerous other mineral and manufactured productions; amongst the latter, notably (in its pure state) in gunpowder. To detect the presence of sulphur in any body, we have only to mix a small fragment of it with about as much carbonate of soda as will lie on the point of a penknife, and to fuse the compound on a piece of charcoal in the yellow flame; when, if sulphur be present, a dark reddish mass will be obtained, which, moistened and placed on a bright piece of silver (a new coin, for instance), will communicate to it a brown or black stain. This stain is, in reality, a compound of the sulphur with the silver, and is the same as that produced when we eat an egg by means of a silver spoon—all eggs containing a portion of sulphur. The tarnishing which silver undergoes when exposed for any length of time, especially in rooms in which coal fires are burnt as fuel, is also due to a similar formation.

Arsenic is occasionally found in nature in a pure state, which is that of a gray and brittle metal, quickly acquiring a black tarnish on exposure to the atmosphere. That terrible poison, the arsenic or 'white arsenic' of commerce, is a combination of the metal with a certain quantity of oxygen, and is called by chemists 'arsenious acid.' Arsenic is readily detected, and with great certainty, by fusing a small quantity of the substance suspected to contain it with carbonate of soda on charcoal, exposing it alternately to the points of the inner and the outer flame; when, if arsenic be present, copious white fumes will be given off, possessing a most powerful odour of garlic. The metal will emit this odour when heated by itself; but its oxygen combinations require the addition of the soda and the charcoal to reduce them to the metallic state prior to their volatilisation.

Iron compounds are easily detected by the blowpipe, as they become attractable by the magnet after exposure to the yellow flame, and impart an impure green colour to glass of borax, which fades before the outer flame to a pale yellowish tint. The latter process for the detection of iron must be resorted to when but a very small quantity of it is contained in the substance under examination. Reduced on charcoal with carbonate of soda, infusible magnetic grains are obtained.

Cobalt, which is usually found in nature united to sulphur or arsenic, is chiefly used in the arts for the production of a fine blue colour in glass, porcelain, and other manufactured articles. The ores of cobalt come principally from Sweden, Prussia, and Saxony, and serve for the preparation of the 'smalt' of commerce; the metal itself being never extracted from them except in the laboratory of the chemist. When pure, the metal is highly magnetic; but this property is entirely destroyed in it by the admixture of a very small proportion of arsenic. The minutest fragment of any compound containing cobalt, imparts to borax, when fused with it in either part of the flame, a deep beautiful and peculiar blue colour.

As a relief to these technical details, which might be extended so as to embrace the complete range of the elementary substances, we shall conclude with an anecdote, which tends to show in a forcible manner the benefit that may be derived from a knowledge of the method of using the blowpipe in many of the ordinary occurrences of life, and in situations that may happen to us all:—Late in the autumn, three or four years ago, two young engineers (whom we will call Mr Y— and Mr C—), engaged in checking the levels of a projected line of railway extending through Devonshire into Cornwall, were quartered for the night at a miserable little inn—one of the few habitations thinly scattered here and there on the edge of the wild and inhospitable Dartmoor. The day had been cold, wet, and cheerless; and Y—, who had overworked himself, and who was suffering from a severe cold, began to feel really ill, upon which Mr C—, after a hasty meal, sallied forth against the wind and rain to procure some medicine for his friend. As the nearest town, however, was some ten miles distant, he was forced to content himself with bringing home a dose of Epsom salts, which he obtained at the shop of a 'grocer, dealer, and vender of horse and patent medicines'—so ran the emblazoned sign-board—at a little hamlet about two miles from the inn. The shop, moreover, being closed, and the head and chief absent, Mr C— was forced to take the medicine as genuine Epsom salts, upon the *ipse dixit* of a sharp lad, who kept guard with great importance over this heterogeneously-stored emporium. Thus supplied, Mr C— made his way back to the inn; and Y— having swallowed a portion of the bitter compound, they retired to their rooms. But in the middle of the night, imagine the horror of C— to be awakened, and to find Y— standing by his bedside, anxiously inquiring 'if he were sure that it was not poison that he had taken, as he could not sleep for startling dreams, and for the strange sensations that he felt all over him.' To spring from the bed, to procure a light, and to draw from the corner of his carpet-bag the little portable blowpipe case, which he always carried with him, was the work of a few moments; and in less than five minutes, C— had thoroughly convinced himself that the remains of the medicine contained only sulphuric acid, magnesia, and water—these being the true constituents of Epsom salts. In his first nervous agitation on jumping out of bed, visions of arsenious acid, acetate or sugar of lead, and oxalic acid, passed across his mind, the two latter especially, from their external resemblance to Epsom salts; but the rapid experiment, which showed him the presence of sulphuric acid, proved to him at the same time the absence of arsenic and lead; and the taste alone was sufficient to dispel all fears respecting oxalic acid, the absence of which he was also enabled to confirm by a simple and decisive test. Thus reassured, Y—, again retired to his bed; and half an hour after, C—, on peeping into his room, had the satisfaction to find him fast asleep.

Now, had C— not possessed the simple knowledge requisite upon this occasion, what would have been the consequences? The inmates of the house must have been aroused, and despatched in various directions in

quest of a medical man, whilst the unfortunate Mr Y— would have been left in all the agonies of suspense, letting the result of his own excited imagination grow more and more into the semblance of a horrible reality, until the effects of fear might have really rendered the visit of the doctor a necessary one.

A TALE OF GOLF.*

On the morning of the 17th August 183—, two native golfers of the famous Dubbieside, in Fife, were seen resting on the brow of the links, and anxiously casting their eyes in the direction of Methill, as if expecting the smoking funnel of the ever-restless St George. Their coats of business were hoisted,† their caps were drawn resolutely over their brows, and they examined with more than common care the knitting of their clubs, the insertion of the lead, and the indentation of the bone.‡ From their capacious pockets they turned out ball after ball with mysterious care,§ and the names of the makers were interchanged with reverential whispers, as they peered into one or two of the most select. At their feet reclined their caddies, grasping each a complete establishment of clubs, and listening with deep respect to the chat of their masters.¶ At last a towering column of smoke announced that the steamer was at hand, while from the end of the bank the flory-boat was plying its way to receive the passengers for Leven. The sportsmen leaped to their feet as the passengers descended the side of the steamer, and an exclamation of 'He's come!' burst from them as they saw a large package of clubs lowered down into the boat. They hastened to the sands to welcome the arrival of the stranger sportsman, who had been sent to dim the glory of Dubbieside; and there, in the stern of the boat, with his arm encircling his instruments of play, did they behold the doughty champion who was backed against the rustic players by some discomfited metropolitans, and who was destined to open the eyes of Dubbieside to its ignorance and vanity in assuming an equality with the clubs south of the Forth.

He was a short, stout-made, sandy-whiskered man; his spectacles not altogether concealing his ferrety eyes; his nose short, and ever ready to curl; and his lip compressing itself, as if it were ever bridling up under some slight or insult. He was the ideal of a small pomposity, set off with a finical attention to dress: rings clasped his little fat fingers, and a diamond pin shone in his puffy breast. He surveyed his new brothers on the shore with an air of loftiness, although he must have known them for his intended associates, and cast on the country round a vexed look, as if his friends had compromised his dignity by sending him to a place that appeared so questionable. His stateliness, how-

* A game almost peculiar to Scotland, played on *downs* or *links* near the sea. The links at Dubbieside, on the north shore of the Firth of Forth, are a noted scene of the amusement. A general account of golf is given in the *Journal*, old series, No. 558.

† For lightness and ease of movement, golfers usually wear a short loose coat, and sometimes this is of a peculiar colour and button, as the uniform of a club.

‡ The chief clubs used in golfing are of wood, loaded with lead, and faced with horn or bone.

§ The object of the game of golf is to strike the ball along the green, and into a small hole, at the smallest possible number of strokes. The ball is composed of leather, stuffed so full of feathers, as to be at once hard and elastic.

¶ The caddie is a servant who carries the bundle of clubs required by the golfer, and who is also in general qualified, by his skill in the game, and his local knowledge, to give directions to his employer.

ever, gave way to rage and abuse when he found that, to get ashore, he must mount on the back of one of the boatmen. There being no alternative, he was horsed amid the smiles of passengers and onlookers—his legs drawn up most ungracefully to save his boots from the brine, and his face, over the shoulder of his carrier, presenting the appearance of the man of the moon in a state of excitement. Arrived at the shore, he was set down with little ceremony, when, unluckily, his first contact with the county of Fife was a seat on the cold wet sand. He was soon put on his legs by his brother sportsmen, whose condolence and jokes were ill calculated to soothe his ruffled feelings; but with a tremendous effort, the high-pressure gentleman readjusted his spectacles, and did assume enough of calmness to look contempt on all around, and discharge an execration at the county of Fife and the insufferable incommensurateness of its conveyances.

The party now moved to the hole from which they were to strike off, the stranger receiving the proposal of a short pause at the public-house of the village with a look of horror. They were here joined by a number of second-rate golf-men—old lovers of the game, who could yet, in despite of rheumatism, follow the rounds—besides a whole troop of ordinary villagers, inspired, if not with a love of golf, at least with an interest in the honour of Dubbieside. The stranger having undone his clubs, round which his red coat was tightly roped—having renounced his handsome green one with gilt anchor buttons, and relinquished it with a sigh, and a shrink of composure to his fate, to the Dubbieside caddie, whom he looked on as a second Caliban—addressed himself to the business of the day. He cast on the ground a 'Gourlay' * white as snow, hard as lead, and elastic as whalebone; and the trembling caddie having, amid the whiz of a shower of novel oaths, teed † it at last to his satisfaction, he seized a club resembling Tam o' Shanter's mare—a supple jade and strang'—gave it a few preparatory vibrations; then, assuming the honour of precedence, he addressed his body to his ball, raised his club, and came round with a determined sweep. The missile sped right into a sandy brae, which the generality of players clear with the first stroke; but such a thing will occasionally happen with a good player. So little was thought of it—though the testy stranger glowed like a red herring; and his humour was by no means restored when he saw his partners, after 'licking their loaves,' make their balls fly like skyrockets over the place where he was earthed. Away, however, the crowd moved—principals, caddies, amateurs, clubmakers, lang weavers, and hecklers—the last class of gentlemen having at this time struck for an advance of wages, and being glad of anything about which to occupy themselves. The whole formed a ring round the strange gentleman, who was now to dig his ball out of its firm lodgment of sand. The occasion, the company, the awkwardness of his position, and the consciousness of the want of sympathy in all around, contributed to heighten the angry feelings of the champion: so, darting a glance of fire at one of the hecklers, who remarked, with tipsy gravity, and most offensive familiarity, in allusion to the hapless situation of the ball, that it would require spectacles to find it out, he gave it such an ill-natured and ill-directed whack, that it sunk completely into the regions of night. The hurras of the hecklers, the yells of the boys, the placid laughter of the paralytic old players, who shook upon their sticks, and the quiet condolence of the rival players, which was given in all the offensiveness of broad Scotch diminutives, now nearly threw the mortified stranger into a fit of apoplexy. The ball, however, was declared not playable; and being

dug out by the fingers of the caddie, was thrown back on the green, at the loss of a stroke in counting to its owner. So, reconcentrating his energy, and assuming as much calmness as could be collected from a composition so formed, he aimed at it a well-directed stroke. Unfortunately, at the very instant, a prophetic groan or hem from one of the flax-teasing fraternity gave a wrong turn to the blow, and swept the ill-destined ball into a bunker.* Another cheer for Dubbieside was about to be raised, when the strange gentleman grappled with the obnoxious heckler, and lustily called for a constable. This produced a rush from his companions, who in an instant released him from the clutch of the indignant golfer, around whom he began dancing and sparring, with his jacket and paper-cap doffed, demanding a ring and fair play. But, the honour of the links being at stake, the Dubbieside players laid hands on the shoulders of the rebels, and awed them into civility: so, after a few grumbings, the Dubbieside men having taken their second strokes, which sent their balls far on into safe and beautiful ground, the troop once more moved on. The metropolitan champion was now to strike his fifth stroke, or 'three more,' and the perspiration was seen in beads on his brow, when he came up and beheld his infatuated 'Gourlay' sitting as if in an egg-cup of sand. The more civilised of the idlers felt something like sympathy, and a feeling of commiseration was beginning to steal over the multitude, when the caddie, having given the gentleman the *cleek* instead of the *iron*, ‡ which he swore was the proper play, the said caddie was unceremoniously deposed with a cuff in the neck that sent him into the sand: the clubs were at the same time wrenched from him by his irate master, who said he would carry them himself. This event did not render the player more cool, or the spectators more indulgent; so, when the ball was jerked from its position, it went slant over the bank to the firm bed of sand on the beach, where it rolled, as on an iron floor, till it reached the water. The flaxmen, swinging arm in arm to the top of the bank, now burst out into a chorus of

'The sea—the sea—the open sea—
I am where I would ever be,' &c.

This was too much. For a moment a sort of stupor seemed to fall on the devoted stranger; but an unearthly calmness and paleness succeeded, as he moved leisurely to the sea, picked up his ball, and put it into his pocket. He had observed the steamer on its return from Largo, and walking leisurely to the flory-boat, which was just going out, he arrived in time to secure his passage. His exit might have been dignified—for even the hecklers remarked that there was something 'no very cannie in his look' when he left the ground, and they did not even venture to cheer—but just as the boat was shoving off, a frenzied-looking woman, running along the beach, made signs for them to stop, and in an instant the mother of the dismissed caddie was in the boat, demanding reparation for the damage done to her laddie. The approach of the obnoxious hecklers to witness this new scene, operated more on the discomfited golfer than the woman's clamour; and a bonus, most disproportionate to the damage, was slung into the horny fist of the outraged mother, who, suddenly lowering her tone, stood upon the beach his only friend. Yet could she not, as the boat moved off, prevent the flaxmen sending after him their chorus of 'The sea, the sea,' until he was seen to ascend the steamboat and suddenly disappear below.

Who or what he was remains a mystery: his backers never gave his name, or a hint of his profes-

* A ball made by an eminent artist of this name.

† At striking off, the ball is perched by the caddie on a little pile of sand, to make it lie fair to the stroke. This is called *teeing*.

* A sand-pit. When the ball falls into a bunker, a stroke is required to replace it on the green. On golfing ground there is usually a succession of such pitfalls, which the dexterous native players avoid, but which are particularly dangerous to strangers.

‡ The *cleek* and *iron* are two clubs with metal heads, one lighter than the other, used in striking the ball from sand or hard ground.

sion. Some imagined him to be a principal Edinburgh clerk; others a half-pay resident in Musselburgh; but what or who he really was, could not be discovered by the most curious inquirer.

SUMNER ON TRUE GLORY.

CHARLES SUMNER, whose essay on War was noticed by us some years ago, has added to his reputation by an address on 'Fame and Glory,' delivered before the literary societies of Amherst College, August 11, 1847, a copy of which, printed at Boston, has just reached us. Mr Sumner's address appears in England at an appropriate time. When a portion of the people, misled by a pretended fear on the score of military defences, would force the country into what would virtually be a war, such a discourse must have a peculiarly useful tendency. Too long has the world been deluded with the glitter and pomp of military array. It is time that the 'fame and glory' usually accorded to warlike exploits were set down at their true value.

We cannot, in these limited pages, follow Mr Sumner through his comprehensive oration; but confining ourselves chiefly to a few prominent points, we shall present, as far as possible, a condensed view of his line of reasoning.

Fame and glory may, for the present purpose, be considered synonymous. They are the expression of a favourable public opinion on certain actions, but any value to be attached to this opinion must depend on the degree of enlightenment and conscientiousness of those who express it. 'In early and barbarous periods, homage is exclusively rendered to achievements of physical strength, chiefly in slaying wild beasts, or human beings who are termed enemies. The feats of Hercules, which fill the fables and mythology of early Greece, were triumphs of brute force. Conqueror of the Nemean lion and the many-headed hydra, strangler of the giant Antæus, illustrious scavenger of the Augean stables, grand abater of the nuisances of the age in which he lived, he was hailed as a hero, and commemorated as a god. And at a later time honour was still continued to mere muscular strength of arm. One of the most polite and eminent chiefs at the siege of Troy, is distinguished by Homer for the ease with which he hurled a rock, such as could not be lifted even by two strong men in our day. And this was glory in an age which had not yet learned to regard the moral and intellectual nature of man, or that which distinguishes him from the beasts that perish, as the only source of conduct worthy of enlightened renown.'

In after-times, in Greece, glory was gained by expert wrestling and chariot-driving, and contests of this kind, as vulgar as modern horse-racing, were the frequent theme of the Greek poets. Rome did not improve on the Grecian notions of glory. The much-prized crowns of honour were all awarded to the successful soldier. The title to a triumph, that loftiest object of ambition, was determined by the number of enemies destroyed. Founded and perpetuated in military aggression, without a single redeeming instance of justice, the Roman Empire finally sunk under the vengeance which it had provoked. The successful robber was in turn a prey to the spoiler. The same tale may be told of all the nations of the middle ages. The glorification of animal strength and courage was universal. Chivalry was only polished brutality. 'The life of the valiant Céspedes, a Spanish knight of high renown, by Lope de Vega, reveals a succession of exploits which were the performances of a brawny porter and a bully. All the passions of a rude nature were gratified at will. Sanquinary revenge and inhuman harshness were his honourable pursuit. With a furious blow of his clenched

fiat, in the very palace of the emperor at Augsburg, he knocked out the teeth of a heretic—an achievement which was hailed with honour and congratulation by his master, Charles V., and the Duke of Alva. Thus did a Spanish gentleman acquire fame in the sixteenth century.'

The 'glories' of chivalry are matched in states of society which a knight would have affected to despise. 'The North American savage commemorates the chief who is able to hang at the door of his wigwam a heavy string of scalps, the spoils of war. The New Zealander honours the sturdy champion who slays, and then eats, his enemies. The cannibal of the Feejee islands—only recently explored by an expedition from our shores—is praised for his adroitness in lying, for the dozen men he has killed with his own hand, for his triumphant capture in battle of a piece of tapa-cloth attached to a staff, not unlike one of our flags; and when he is dead, his club is placed in his hand, and extended across the breast, to indicate in the next world that the deceased was a chief and a warrior. This is barbarous glory! But how little does all this differ from the frantic eagerness of knights to capture the flag of an enemy, or the 'glory' of being commemorated in stone, with the legs crossed, and the body clothed in armour! What a mob of fools mankind have been in all ages and countries!

Carrying his eye over the present condition of society, Mr Sumner admits that a love of fame or glory—that is, a love of approbation carried to an extreme length—is neither immoral nor blameable when directed to those acts which promote human happiness. At the same time, this species of personal ambition 'detracts from the beauty even of good works.' In our opinion, the man who does not do what good is in his power, without regard to human applause, is not entitled to be called great. The popularity to be aimed at, according to the correct definition of Lord Mansfield, is 'that which follows, not that which is run after; it is that popularity which, sooner or later, never fails to do justice to the pursuit of noble ends by noble means.'

Mr Sumner is next led to draw a comparison between fame derived from the pursuit of peaceful and useful arts, and that from successful war. 'It is from the lips of a successful soldier, cradled in war, the very pink of the false heroism of battle, that we are taught to appreciate the literary fame, which, though less elevated than that derived from disinterested acts of beneficence, is yet truer and more permanent far than any bloody glory. I allude to Wolfe, the conqueror of Quebec, who has attracted perhaps a larger share of romantic interest than any of the gallant generals in English history. We behold him, yet young in years, at the head of an adventurous expedition, destined to prostrate the French empire in Canada—guiding and encouraging the firmness of his troops in unaccustomed difficulties—awakening their personal attachment by his kindly suavity, and their ardour by his own example—climbing the precipitous steeps which conduct to the heights of the strongest fortress of the American continent—there, under its walls, joining in deadly conflict—wounded—stretched upon the field—faint with the loss of blood—with sight already dimmed—his life ebbing fast—cheered at last by the sudden cry, that the enemy is fleeing in all directions—and then his dying breath mingling with the shouts of victory. An eminent artist has portrayed this scene of death in a much-admired picture. History and poetry have dwelt upon it with peculiar fondness. Such is the glory of arms! But there is, happily, preserved to us a tradition of an incident of this day, which affords a gleam of a truer glory. As the commander floated down the currents of the St Lawrence in his boat, under cover of the night, in the enforced silence of a military expedition, in order to effect his landing at an opportune promontory, he was heard to repeat to himself that poem of exquisite charms—then only recently given to mankind, now familiar as a household word wherever the mother-tongue of Gray is spoken—the "Elegy in a

Country Churchyard." Strange and unaccustomed prelude to the discord of battle! And as the ambitious warrior finished the recitation, he said to his companions, in a low but earnest tone, that he "would rather be the author of that poem than take Quebec." And surely he was right. The glory of that victory is already dying out, like a candle in its socket: the true glory of the poem still shines with star-bright immortal beauty.' How might this comparison be extended!

Of military prowess, in reference to fame, Mr Sumner entertains but a poor opinion. Animal courage, on which military ardour is based, is exhibited in a greater degree among some of the inferior tribes of creatures. 'Courage,' he says, 'becomes a virtue when exercised in obedience to the higher sentiments—to promote justice and benevolence by Christian means. It is of a humbler character if these objects are promoted by force, or that part of our nature which we have in common with beasts. It is unquestionably a vice when, divorced from justice and benevolence, it lends itself to the passion for wealth, for power, or glory.'

The question, however, may be put—Is there no difference between the defenders of their country from unjust invasion, and those who fight aggressively? No doubt those who die in repelling violence are worthy of cordial sympathy; but the strife is to be regarded 'only as a token of the dishonourable barbarism of the age—like the cannibalism of an earlier period, or the slavery of our own day.' Every considerate person must join in regarding war as an unchristian institution, and at best 'a melancholy necessity, offensive in the sight of God, hostile to the best interests of men.'

Unfortunately, there can be little hope of seeing war and warlike preparation abated as long as jealousies and rivalries are maintained between neighbouring nations; and we might almost venture to say, that if half the pains were taken to cultivate a good understanding among the people of contiguous countries, that is employed to raise mutual distrust, even defensive wars would be unknown. No pains of this kind, however, are ever taken. The people of one country remain in ignorance of the people of another, and by the entanglements of diplomacy, as well as by the manoeuvres of those who make war a trade, are too easily brought into collision. Glory gained in battles which are so brought about, can be spoken of only with loathing and detestation.

We close our paper with the following passages, which seem to us to possess the character of true oratory.

'God only is great! is the admired and triumphant exclamation with which Massillon commences his funeral discourse on the deceased monarch of France, called in his own age *Louis the Great*. It is in the attributes of God that we are to find the elements of true greatness. Man is great by the godlike qualities of justice, benevolence, knowledge, and power: and as justice and benevolence are higher than knowledge and power, so are the just and benevolent higher than those who are intelligent and powerful only. Should all these qualities auspiciously concur in one person on earth, then we might look to behold a mortal supremely endowed reflecting the image of his Maker. But even knowledge and power, without those higher attributes, cannot constitute greatness. It is by his goodness that God is most truly known; so also is the great man.' When Moses said unto the Lord, "Show me thy glory," the Lord said, "I will make all my goodness pass before thee." It will be easy now to distinguish between those who are merely memorable in the world's annals, and those who are truly great. If we pass in review the historic names to whom flattery, or a false appreciation of character, has expressly awarded this title, we shall find its grievous inaptitude. Alexander, drunk with victory and with wine, whose remains, at the early age of thirty-two, were borne on a golden car through conquered Asia, was not truly great; Cæsar, the ravager of distant lands, and the trampler upon the liberties of

his own country, with an unsurpassed combination of intelligence and power, was not truly great; Louis XIV. of France, the magnificent spendthrift monarch, prodigal of treasure and of blood, and panting for renown, was not truly great; Peter of Russia, the organiser of the material prosperity of his country, the murderer of his own son, despotic, inexorable, unnatural, vulgar, was not truly great; Frederic of Prussia, the heartless and consummate general, skilled in the barbarous art of war, who played the game of robbery with "human lives for dice," was not truly great. Surely there is no Christian grandeur in their careers?

'There is another and a higher company, who thought little of praise or power, but whose lives shine before men with those good works which truly glorify their authors. There is Milton, poor and blind, but "bating not a jot of heart or hope"—in an age of ignorance, the friend of education—in an age of servility and vice, the pure and uncontaminated friend of freedom—tuning his harp to those magnificent melodies which angels might stoop to hear—confessing his supreme duties to humanity in words of simplicity and power. "I am long since persuaded," was his declaration, "that to say or do ought worth memory and imitation, no purpose or respect should sooner move us than love of God and mankind." There is Vincent de St Paul of France, once in captivity in Algiers: obtaining his freedom by a happy escape, this fugitive slave devoted himself with divine success to labours of Christian benevolence, to the establishment of hospitals, to visiting those who were in prison, to the spread of amity and peace. There is Howard, the benefactor of those on whom the world has placed its brand, whose charity—like that of the Frenchman, inspired by the single desire of doing good—penetrated the gloom of the dungeon, as with angelic presence. And lastly, there is Clarkson, who, while yet a pupil of the university, commenced those lifelong labours against slavery and the slave-trade which have embalmed his memory. Writing an essay on the subject as a college exercise, his soul warmed with the task, and at a period when even the horrors of the middle passage had not excited condemnation, he entered the lists, the stripling champion of the right.'

Taking an example from these instances of true glory, 'let us reverse the very poles of the worship of past ages. Men have thus far bowed down before stocks, stones, insects, crocodiles, golden calves—graven images, often of cunning workmanship, wrought with Phidian skill, of ivory, of ebony, of marble—but all false gods. Let them worship in future the true God, our Father as he is in heaven, and in the beneficent labours of his children on earth. Then farewell to the Syren song of a worldly ambition! Farewell to the vain desire of mere literary success or oratorical display! Farewell to the distempered longings for office! Farewell to the dismal, blood-red phantom of martial renown! Fame and glory may then continue, as in times past, the reflection of public opinion; but of an opinion, sure and steadfast, without change or fickleness, enlightened by those two suns of Christian truth—love to God and love to man. From the serene illumination of these duties, all the forms of selfishness shall retreat, like evil spirits at the dawn of day. Then shall the happiness of the poor and lowly, and the education of the ignorant, have uncounted friends. The cause of those who are in prison shall find fresh voices, the majesty of peace other vindicators, the sufferings of the slave new and gushing floods of sympathy. Then, at last, shall the brotherhood of mankind stand confessed—ever filling the souls of all with a more generous life—ever prompting to deeds of beneficence—conquering the heathen prejudices of country, colour, and race—guiding the judgment of the historian—animating the verse of the poet and the eloquence of the orator—ennobling human thought and conduct, and inspiring those good works by which alone we may attain to the heights of true glory. Good works!

such, even now, is the heavenly ladder on which angels are ascending and descending, while weary humanity, on pillows of stone, slumbers heavily at its feet.'

INDIAN EXPERTNESS.

THE natives of India have for ages been noted for their extraordinary personal activity and ingenuity—qualities which fit them for being the most expert thieves and jugglers in the world. The performances of London or Parisian freebooters sink to nothing in comparison with the daring feats of the Dacoits of Hindostan, from whom in all probability the wandering gipsies of Europe drew their origin. The stories told of Dacoits are almost too marvellous to be credited. When sleeping in your tent, the experienced Dacoit will not scruple to burrow in the earth, in order to obtain an entrance, unseen by the sentinel at the door; or swimming down the river in the night, his head covered with an earthen vessel, he will glide unnoticed under the windows of your budgerow, and noiselessly creeping in at the window, make off with everything you have, while you and your family are indulging in a pleasant nap; and finally, when caught and condemned to death, he will walk straight up to a piece of artillery, and pressing his chest against its muzzle, allow himself, without a struggle, or even a look of regret, to be blown into atoms—a death inflicted in the field on Dacoits and other marauders.

One would think that the Hindoo must have a constitutional aptitude for theft, his body is so slim, yet so muscular, his motions so snake-like, his agility so astonishing. In fact, after a little practice, he is like a man made of India-rubber, and seems to proceed without the slightest reference to the fragility of any part of his frame. Mr Fane tells us that, at Delhi, he saw several fellows jumping sheer down into a well *ninety* feet deep, in pursuit of a rupee thrown in to tempt them. There was a slanting passage on the opposite side, by which they got out again; but the perpendicular plunge was the feat expected, and this they performed again and again with the utmost readiness, men and boys rushing in emulation, each anxious to be the first to spring into the abyss after the prize.

Mr Tennant supposes that the superiority of the Hindoos in feats of agility and legerdemain arises from their pursuing these arts as a distinct and constant (and he might have added hereditary) profession. However this may be, he tells us that their doings surpass all credibility. In balancing, for instance, which is an effort of skill without the possibility of deception, a man frequently places five of the common earthenware water-pots, one over the other, upon his head, and a girl climbing to the uppermost, he dances with this extraordinary coiffure round the field. On another occasion, 'the same person balances a pole of sixteen feet long, the bottom of which is fixed into a thick cotton sash or girdle; another man gets upon his back, and from thence runs up the pole, his hands aiding his feet, with the nimbleness of a squirrel. He then proceeds first to extend himself on the pole upon his belly, and then upon his back, his legs and arms both times spread out. He next throws himself horizontally from the pole, which is all the while balanced on the girdle, holding only by his arms. This attitude among the tumblers is called the flag. Thirdly, he stands upon his head on the top of the pole, holding below the summit with his hands. Finally, he throws himself from this last position backwards down the pole, holding by his hands, then turns over again, holding by his feet; and this is repeated over and over till he reaches the ground. These, and a thousand other feats, constitute the amusement of the idle and the subsistence of a numerous class of strollers.'

The most beautiful of all the feats performed by Indian jugglers, is the well known tossing of six balls, which are sustained in the air, or made to revolve round the head, by a dexterous and gentle touch of the hand. This is anything but an unintellectual exhibition. There is in it no pretension to legerdemain, no

deception of the eyes. It is a feat of honest skill, and to the thoughtful is philosophically curious. It demonstrates an extraordinary calculation as to keeping time, and shows perhaps more than anything else the power of concentrating the mind on a single subject of thought. We feel assured that the mountebank who can perform the clever manœuvre of making half-a-dozen balls spin round his person, possesses a capacity which, well-directed, might lead to much higher things.

It is unfortunate, from the state of society in India, that personal expertness should so much take a furtive direction. Dacoitism may be said to be carried the length of a science, for in its higher professors it disdains theft on a mean or bungling scale of operation. Colonel Davidson mentions the case of a Dacoit who had stolen a man's garments from under his head, severing with a knife a part of the article which was either entangled or purposely fastened to the pillow. 'This,' says he, 'was a mere bungler, and I am persuaded, an apprentice without experience or talent. The scientific mode is well known: when it is necessary to make a sleeping man turn on his other side, you tickle his opposite ear with a straw till he obeys, and then a dexterous pull secures the booty. It is in this way that many excellent English gentlemen awake in the morning without mattress, blanket, or sheet either above or below them; having at the same time a favourite terrier asleep under their beds, and a pair of detonating pistols under their pillows.'

Broughton describes a less 'clumsy' theft committed in the Maharratta camp, of which he gives a lifelike picture. A tent was entered in which fourteen men were sleeping, two of them at the door with drawn swords by their sides. The thieves, nothing daunted by the crowd, made use of the swords to cut their way into the tent, and picking their steps among the sleepers, possessed themselves of the property they coveted. On another occasion, one of the maharajah's finest horses was carried off by a fellow, who, observing the rider dismount, and give the bridle into the hands of the attendant, darted forward, severed the reins with his sword, and galloped off in an instant.

The following instance of Dacoitism, illustrative of our subject, was related to us by a gentleman long resident in India:—

General S—, who considered himself able to outmanœuvre any Dacoit in Bengal, had given orders to pursue and bring before him a thief whose misdemeanours had warranted the severest punishment. The poor Dacoit was caught and brought up for examination. He was a fine specimen of the East Indian race. Of a clear brown, every feature of the most perfect mould, and with a form of exquisite symmetry and proportion, he now stood, nothing daunted, before the chief whose breath was to decide his fate.

'You are a Dacoit?'

'I am.'

'You are aware that the crimes you have been guilty of are punishable by death?'

'If such be my *nusseed* (destiny), I am prepared to meet it.'

'Would you avoid it?'

'Decidedly.'

'Well, then, listen. Scarcely a night passes that several of our cavalry horses are not stolen. In spite of our constant vigilance, in spite of sentinels, and every other precaution, they are carried off. Do you know how this is effected?'

'I do.'

'Well, then, on one condition your life shall be spared: show us the mode in which these extraordinary robberies are committed, and I will not only set you free, but give you one hundred rupees.'

The Dacoit almost sneered at the offer of the bribe; but after a moment's pause, he replied, 'I am ready.'

'Bravo!' cried S—, well pleased. 'Now we'll get at the secret. Let the captains and officers commanding troops be ordered instantly to attend at my stable tent

to see the trick, and be able to guard against it. Desire two cavalry soldiers and two grooms also to be there; and let them make haste, for I am all impatience to see the feat performed.'

In a quarter of an hour all was prepared. A very spirited and valuable horse of the general's was selected for the trial, one that allowed none save his master or his feeder to approach him. But the robber rather exulted in this, as he declared it would the better display his dexterity.

In the first place, the horse was tethered, as all cavalry horses in the field in India are, beneath an open tent, his fore legs being each made fast by a rope to a staple in the ground. The hind legs were similarly secured. A groom lay on one side of him, a grass-cutter (forager) on the other. The soldier to whom he was supposed to belong was stretched immediately behind him, and another very near, with orders that if they could in any way detect, by noise or touch, the tread of the robber, they were instantly to start up and seize him. Till then, they were to close their eyes and affect to sleep.

The Dacoit, on the other hand, threw himself on the grass, and, like a snake, crawled up to the first guard, and lay quietly beside him for a moment, to ascertain if he were asleep; then gently rising over him, he crept between the groom and the horse, till he actually lay beneath the spirited animal, which, extraordinary to say, never attempted to stir. With the greatest nicety he undid one of the hind tethers, or spansills, then one of the fore; then he paused a while, and the horse stirred not. He then undid, with great care and nicety, the other two, and creeping out between his fore legs, managed to substitute a native bridle for the head-stall. The spectators were lost in admiration, particularly the old general, whose praise was unbounded. But still the most difficult part of the task remained to be done—namely, to get the horse away. This was effected by turning him round. The Dacoit now quickly raised himself up by his arms, and the next moment was on the animal's back. Then walking him up to his supposed guard, the horse stepped over his legs, which were close together, and in the next instant he stood clear of all impediment, when the ingenious rider struck both his heels into him, and set off down the lines in a hand gallop.

General S— was pleased beyond expression with the man's address; and though he hardly knew how to guard against such expert thieves, yet he now saw the modes employed by the robbers, and it might be possible to invent some means to thwart them.

In the meantime the adroit native had arrived at the extreme outskirts of the camp, when the general, who began to think he had shown them enough of his skill, called on him to come back. 'None are so deaf as those who will not hear.' From that moment to the hour of his death, the worthy commander never saw his favourite charger, and what was still worse, he was ever afterwards bound to blush at his own simplicity whenever the word 'Dacoit' was mentioned in his presence.

Numerous villages in Central India are entirely peopled by Dacoits, who carry their depredations westward to the banks of the Indus, and southward to Bombay and Madras. In our own territories, Colonel Sleeman says there are likewise whole colonies of them, a thousand such families being located in the Upper Doab alone. The landholders and police officers frequently make large fortunes by their share of the spoil; and thus robbery is a very safe business when carried on at some distance from home. But independently of the venality of the functionaries, it is extremely difficult—in some cases impossible—to get witnesses to appear; and this state of things must continue till the meshes of justice are drawn closer, and men are not ruined by the loss of time attending a prosecution. Till then, the wonderful ingenuity of a considerable portion of the Hindoos must continue to be turned towards the

arts of knavery, instead of enriching their country by such masterpieces of industry as the famous muslins of Dacca, which have not yet been surpassed even by the science of Europe.

EARLY NEWSPAPER ADVERTISEMENTS.

A SCRAP of the advertising sheet of a newspaper, some thirty or forty years old, happening to fall into our hands the other day, afforded considerable amusement, and gave birth to the idea, that if the investigation were pushed a little beyond this date, it might prove productive of several curious facts. Full of this conception, we repaired to the British Museum, and were very shortly seated at a table surrounded with a mountain of dusty folios. We were soon immersed in the mass, and aged 'Diurnals,' venerable 'Intelligencers,' 'Mercuries' yellow and grim, and hoary old 'Gazettes,' underwent a careful scrutiny. As some of these patriarchs were in their one hundred and eightieth year, it may be readily conjectured they supplied a very queer sort of literary repast. Engaged in this pursuit, we may be said to have witnessed the very birth of that prolific monster whose many-membered body now occupies so large a share of public attention. We have seen the hydra when it was a bantling with only one head. It was no very arduous undertaking to find the first advertisement; but to trace the gradual development of form, and feature, and numerical strength, was a labour for a literary Hercules, and by no means to be undertaken by any one who could not spend a year or two on the subject. We therefore confess that, after gleaning a few curiosities, we consigned the huge mass back to its dusty vaults again; and believing that some of the information we derived may interest many of our readers, we beg to present them with this article as the result of our short dive into a sea of newspapers of the past and part of the preceding century.

We believe that the first advertisement discoverable in any newspaper is one which refers to the theft of two horses. It is contained in an early number of a paper called the 'Impartial Intelligencer,' published in the year 1648, and consequently now (1848) exactly two centuries old. It was inserted by a gentleman of Candish, in Suffolk. After this, these notifications were very few and far between for several years, until we approach the era of the 'London Gazette.' Here, for some time, they assumed no very definite form, consisting merely of a short official notice in italics at the end of each Gazette, and not headed with the title 'Advertisement.' One of the first called by this name—in this paper, that is to say—is contained in the number for May 6, 1667. It is sufficiently remarkable to deserve resuscitation, and runs thus:—

'AN ADVERTISEMENT.

'We are, by his majesty's command, to give notice that, by reason of the great heats which are growing on, there will be no further touching for the evil till Michaelmas next, and accordingly all persons concerned are to forbear their addresses till that time!'

This remarkable advertisement, which, so far as we know, has escaped the notice of historical writers, is repeated in four or five subsequent Gazettes, after which it disappears, to the extent of our search, never to reappear again. The value of the newspaper as an advertising medium was now beginning to be felt. Persons who had lost their dogs or other property began to give notice thereof in the tailpiece of the last column of the Gazette. The Duke of Albemarle appears to have been particularly unfortunate, for his advertisements appear four or five times—once for 'A white greyhound dog with red cheeks, intelligence to be brought to the Duke of Albemarle's porter at the Cockpit.' The Prince Rupert was equally unfortunate. Felonies of this nature appear to have been of great frequency, and even the royal stables and falconry were not secure.

Advertisements were now to be directed to another object than the mere proclamation of missing property, or of official notices. A far-sighted gentleman, by name

'Egbertus Willis, of the city of Utrecht,' informs the public that he is 'skilful in the cure of crookedness, and other defects of the body.' Such is the modest commencement of the present foul disgrace of a portion of the public press—quack advertisements! This was like the 'letting forth of waters.' Commercial advertising now took origin, and gained strength. We believe an enterprising tobacconist makes one of the first *entrées* as an advertiser in this character. This was a Mr 'James Norcock, snuffmaker and perfumer,' whose sign was the harmonious union implied in the 'jessamine tree and snuffing gentleman,' and who professed to sell 'all sorts of snuffs, Spanish and Italian; also the best Spanish lozenges and cashen to be eaten, and all sorts of rare Spanish perfumes.' Auctioneers follow Mr Norcock's train, of whose unpretending announcements the following is a fair sample:—'On the fifteenth day of March next (1684) will be exposed to sale by the candle, two elephants, male and female.' Other advertisements state 'by inch of candle,' from which it will readily be understood that the bidding commenced with the lighting, and terminated with the consumption, of 'the inch of candle,' a method suited to the sober spirit of those times. If more prodigal of time, auctioneers were more frugal of their words in those days than in our own. Let the following pithy announcement shock any Mr Robins as it may, we shall not withhold it, but declare how that a 'splendid site,' an 'advantageous investment for capital,' a 'magnificent property,' was actually advertised in two lines, containing two sentences:—'The bowling-green in Southwark Park is to be let to build upon; inquire there, and you may know farther.' From there being but one, and that only an occasional advertisement, in the 'Gazette' at its commencement, thirty years later, ten or a dozen appear in each journal. Scattered through them occur a number and variety of advertisements about runaway servants, in the description of whose persons we are sometimes informed that they 'wore their own hair.'

With the commencement of the eighteenth century, the genius of advertising had attained a considerable development, and the general character of the advertisements resembled in many respects that of the present time. They related to the wants, and luxuries, and diseases of mankind; and these, with but little variation, remain the same from century to century. At this time quack advertising, with the strength of a poisonous weed, overtopped all the rest in effrontery, immodesty, and extent. Some of these announcements indulge in all the romantic hyperbole commonly accepted and disbelieved in our own age. A medicine known as 'Scots' pills' reaches, we believe, the greatest age among them. It is the Methuselah of the lot. A brother patriarch is Dr Benjamin Godfrey's miraculous elixir or cordial. There was even in the seventeenth century, towards its close, a famous anti-doloric oil, which administered instant ease to the excruciations of gout and rheumatism, and was avowed to be 'likewise excellent for all old aches, pains, bruises, strains, stiffness, palsy, &c.' Next to these were Major John Choke's 'Incomparable necklaces for the easement of children in cutting their teeth.' We should have thought Major Choke's name quite sufficient. The king of France, however, was of a different opinion; for all his four children accomplished their dentition, to the immortal glory of Major Choke, solely by the preternatural aid they received from these invaluable ornaments. But greater miracles were in reserve for the healing art than even these. The original edition of the 'Spectator' for July 2, 1712, contains a notice which we shall abbreviate:—'*Loss of memory or forgetfulness* certainly cured by a grateful electuary peculiarly adapted to that end. It makes the head clear and easy, the spirits free, active, and undisturbed, and revives all the noble faculties of the soul, enabling those whose memory had been totally lost (!) to remember the minutest circumstance of their affairs to a wonder!' Another, which appeared in the same sheet, was an 'Admirable confection which assuredly cures *stuttering* and *stammering* in children and grown persons.' Its stupendous powers were

retailed at the insignificant sum of half-a-crown a pot. No fewer than sixteen quack advertisements, of ten or twelve lines each, appear in the 'Craftsman' for 1730, occupying the whole of the last side of that paper. Omitting all notice of the offensive ones, it may amuse to quote the titles of a few others. There was the 'Julapium Ashmaticum' for broken-winded men, in proximity to 'The Infallible Remedy for Broken-winded Horses;' 'The Great Elixir;' 'Famous for the Vapours;' 'Angelick Snuff'—for human angels, we presume; and a sly advertisement, something after the modern style, headed—'In consequence of the daily disturbance in churches by coughing, the original inestimable angelick electuary,' is strongly recommended for the public good. Advertising perfumers were not wanting to flatter the vanity of these old times. There were creators of artificial beauty in the seventeenth century, and they abound in the nineteenth. If there was not a 'Kalydor,' there was a 'Britannic Beautifier,' we have not the smallest doubt of equal efficacy. If there was no wonder-working 'Curling fluid,' there was the incomparable 'White water to curl gentlemen's hair.' Even old *wigs* that look scandalous, after a simple application of that liquid, would curl as freshly and as stiffly as if they had just left the hands of the *perruquier*. Instead of advertising from 'kings' palaces' and plate-glass groves, the barbers of those times, utterly innocent of such circumlocutions as are at present in vogue, spoke out in the following right-down language:—'This is to acquaint gentlemen and others that there is a fresh parcel of perukes of all sorts, Bobs, Tyes, and Naturals, that the maker will warrant to be made of the true human English hairs.'

We believe that the following advertisements relate to a species of insurance which will be new to many of our readers. In the 'British Apollo' for 1710 is the following notice:—'A first and second claim is made at the office of Assurance on Marriage in Roll Court, Fleet Street. The first will be paid on Saturday next; wherefore all persons concerned are desired to pay two shillings into the joint-stock, pursuant to the articles, or they will be excluded. The two claimants married each other, and have paid but two shillings each.' Yet they were to receive L.37. This advertisement may receive its explanation in another:—'Any person, by paying two shillings at their entrance for a policy and stamps, and two shillings towards each marriage until their own, when (the number is) full, will secure to themselves L.200, and in the meantime, in proportion to the number of subscribers.' So well did this speculation answer, that three offices shortly opened in the same line, one of which had its appropriate situation in *Petticoat Lane*. These examples excited the ingenuity of others; and we shortly light upon an advertisement from an office of insurance upon baptism. In this case persons were to pay two shillings and sixpence towards each infant baptised until their own. If the list was full, they could then receive L.200: 'the interest of which is sufficient,' says the advertisement, 'to give a child a good education, and the principal reserved until it comes to maturity.' There is no doubt that many of these projects were wholesale systems of robbery. For a time, however, they were greedily run after.

Many of the advertisements of the public amusements are diverting. There was the 'famous water-theatre of the late ingenious Mr Winstanley,' the architect of one of the Eddystone lighthouses, 'wherein is shown the greatest curiosities in waterworks—the like was never performed by any. Sea-gods and goddesses, nymphs, mermaids, and satyrs, all playing water as suitable, and some of them fire, mingled with water; and the barrel that plays so many liquors is broke to pieces before the spectators.' Next were the performances of a wonderful posture-master, who offered the attractions of 'extending his body into all deformed shapes—making his hip and shoulder meet together,' and half twisting his neck off. Mr Fawkes's theatre near the Haymarket was another favourite resort, where he presented the following entertainments:—He caused a tree to grow up in a flower-pot on the table, which would blow and bear ripe fruit in a

minute's time; besides which were his famous little posture-master, musical clocks, Venetian automata, and sea-pieces with *naumachia*. The advertisement of one of the theatres—we are half afraid it is a hoax, yet it occurs, we believe, in the 'Daily Advertiser'—states that the performances are in honour of the presence of 'Adomo Oronooko Tomo, sent to see the kingdom of Great Britain by the Great Trudo, Audato, Povesaw, Danjer, Eujo Suveveto, king of Dawhomay.' His highness was to be amused with the humours of Sir John Falstaff, altered from Shakespeare. Near Charing-cross was an exhibition advertised of a little man 32 years old, and 36 inches high, with his wife of the same age, and under 36 inches, and a little horse 24 inches high, and a satyr that had a head like a child.

Charging for advertising commenced at a very early period. A few might at first have been inserted gratuitously, but the revenue flowing from this source was so obvious a consideration, that the practice soon began of charging a fixed sum for each. In the 'Mercurius Librarius,' a bookseller's paper, it is stated that, 'To show that the publishers design the public advantage of trade, they will expect but sixpence for inserting any book, nor but twelve pence for any other advertisement, relating to the trade, unless it be excessive long.' The next intimation of price is in the 'Jockey's Intelligencer,' which charged a shilling for each, and sixpence for renewing. The 'Observer,' in 1704, charged a shilling for eight lines; and the 'Country Gentleman's Courant,' in 1706, inserted advertisements at twopence a line. The 'Public Advertiser' charged for a length of time two shillings for each insertion.

It has not often been our lot to engage in a diversion which has suggested so many solemn and mournful thoughts as this. We have heard the very voices of the past speaking to us. A century and a half has been living before our eyes—where are they now!—their passions, pleasures, wants, amusements, eccentricities, wisdom, and folly, hushed in the cold silence of the unsparing tomb. Surely said the preacher, 'Vanity of vanities—all is vanity.' We began our paper in mirth, we are constrained to end it with a touch of gravity.

THE COMMON NETTLE.

One of the plants which follow the footsteps of man, and which often indicates by its presence the situations on which cottages stood in some of the now thinly-peopled or deserted Highland glens. Thus, while proprietors of the soil, in their desire to have the exclusive use of large tracts of country, whether for sheep or for deer, make clearances of Highland glens, and endeavour to get rid of all vestiges of the peasantry who inhabited them, and 'lay field to field, till there be no place, that they may be placed alone in the midst of the earth,' there springs up in the wild waste a plant, which marks the cottage sites as hallowed ground, and tells of the deed to future generations. The occurrence of nettles in neglected gardens and fortresses was a subject of observation in times long gone by. Thus Solomon, when speaking of the field of the clothful and the vineyard of the man void of understanding, remarks that 'nettles had covered the face thereof;' and the Prophet Isaiah, when alluding to the desolation which shall come on the enemies of God's people, says, 'Thorns shall come up in her palaces, nettles and brambles in the fortresses thereof.'—*Bass Rock*.

LAUGHTER.

'Laugh and grow fat,' is an old adage; and Sterne tells us that every time a man laughs he adds something to his life. An eccentric philosopher of the last century used to say that he liked not only to laugh himself, but to see laughter and hear laughter. Laughter is good for health; it is a provocative to the appetite, and a friend to digestion. Dr Sydenham said the arrival of a merry-andrew in a town was more beneficial to the health of the inhabitants than twenty asses loaded with medicine. Mr Pott, a celebrated surgeon, used to say that he never saw the 'Tailor riding to Brentford' without feeling better for a week afterwards.

MY CHILDHOOD'S TUNE.

[This exquisite piece is from a little volume recently published, entitled 'Lyrics and Miscellaneous Poems,' by Francis Brown. We select it for extract, not only on account of the merit of the verses themselves, but because they convey a good idea of the beauty, gentleness, and grace which characterise the volume generally. Miss Brown is almost wholly blind—a circumstance which lends an interest to her poems, independent of that commanded by her genius.]

And hast thou found my soul again,
Though many a shadowy year hath past
Across its chequered path since when
I heard thy low notes last?

They come with the old pleasant sound,
Long silent, but remembered soon—
With all the fresh green memories wound
About my childhood's tune!

I left thee far among the flowers
My hand shall seek as wealth no more—
The lost light of those morning hours
No sunrise can restore.

And life hath many an early cloud
That darkens as it nears the noon—
But all their broken rainbows crowd
Back with my childhood's tune!

Thou hast the whisper of young leaves
That told my heart of spring begun,
The bird's song by our hamlet eaves
Poured to the setting sun—

And voices heard, how long ago,
By winter's hearth or autumn's moon!—
They have grown old and altered now—
All but my childhood's tune!

At our last meeting, Time had much
To teach, and I to learn; for then
Mine was a trusting wisdom—such
As will not come again.

I had not seen life's harvest fado
Before me in the days of June;
But thou—how hath the spring-time stayed
With thee, my childhood's tune!

I had not learned that love, which seemed
So priceless, might be poor and cold;
Nor found whom once I angels deemed
Of coarse and common mould.

I knew not that the world's hard gold
Could far outweigh the heart's best boon;
And yet thou speakest as of old—
My childhood's pleasant tune!

I greet thee as the dove that crossed
My path among Time's breaking waves,
With olive leaves of memory lost,
Or shed, perchance, on graves.

The tree hath grown up wild and rank,
With blighted boughs that time may prune—
But blessed were the dews it drank
From thee—my childhood's tune!

Where rose the stranger city's hum,
By many a princely mart and dome,
Thou comest—even as voices come
To hearts that have no home.

A simple strain to other ears,
And lost amid the tumult soon;
But dreams of love, and truth, and tears,
Came with my childhood's tune!

DOMESTIC DUTIES.

Seeing that almost the whole of the day is devoted to business abroad, and the remainder of my time to domestic duties, there is none left to myself—that is, for my studies; for on returning home, I have to talk with my wife, prattle with my children, and converse with my servants; all of which things I number among the duties of life. Since, if a man would not be a stranger in his own house, he must, by every means in his power, strive to render himself more agreeable to those companions of his life whom nature hath provided, chance thrown in his way, or that he has himself chosen.—*Sir Thomas More*.

SATURDAY, MARCH 11, 1848.

PRICE 1½d.

I N N S.

It is pleasant to take one's ease in one's inn; but it is essential to the realisation of the idea that it should be a good inn. For an inn to be good, there is no necessity that it should be fine. It may be fine, and not good. The quality of goodness in an inn depends on its fulfilling the ideal of its own pretensions, whatever these are. All we require is, that it should be good of its class—that is, if it be a grand inn, that it should be grand without any derogatory slatternliness, any misapplication of servant power, or any other drawback from splendour; if a humble inn, pretending only to a moderate presentment of comforts, that it should really be a tolerable home for its own class of customers; and so forth. These postulates being attained, then we may each take our ease in our inn indeed; and a very great privilege it is to be able to do so at usually so small an expenditure of money. Duty, pleasure, whim, or whatever else, calls us out from home—we travel or ramble all day—it is perhaps a wilderness, with only a few cottages scattered over it; but, lo! it is a post-road we are upon; and there, for certain, at the end of a few miles, rises a goodly house, furnished with all the ordinary comforts of refined life—there a smiling welcome awaits us: if wet, we are sympathised with and dried; if hungry, the table is instantly spread: we lounge over a good fire all the remainder of the evening, and for the night repose among sheets redolent of the daisies where they were bleached. Mere payment of a bill next morning, though a legal, is not a moral discharge for all these benefits. Never do I enjoy them without a personal thankfulness to the honest people who have chosen a mode of livelihood so useful and so kindly towards their fellow-creatures, as well as a more sentimental gratitude for the privilege of living in a country so settled, and so advanced in the things of civilisation, as to admit of such a regular, albeit mercantile system of hospitality.

Between the highest and humblest of all things the intervals are usually enormous—for example, as has been somewhere remarked, between the Archbishop of Canterbury and the hedge parson, or between Sir Atley Cooper and the village apothecary—however they may be describable by common names, as in these cases clergyman, or doctor. So between Mivart's, with its rows of fifteen windows to Brook Street, or Douglas's and Barry's in Edinburgh, or Gresham's in Dublin, and the modest aburges of the village, with its 'red lion predominating over a punch-bowl,' or its black bull, with gilt hoofs and horns, the interspace is vast; and yet they all belong to the genus *inn*, as well as the hundred shades of variety which stand between. All, too, may have their virtues, if conducted in a fitting manner—on that everything depends. There is some-

thing interesting, almost awing, in an outrageously large inn. To be shown with your carpet-bag into No. 189, or 217, is of the nature of an impressive event—somewhat chilling, too, perhaps, seeing how individuality sinks when you consider that you are only one of a multitude making your home for the night in this vast house. One feels in such a case of wonderfully small account in the eyes of both servants and masters. Your illness, or even death, would hardly fix their regard for a moment. The beauty, however, is in the regularity—the system. The bed-chambering power perfect as clockwork, in despite of Virgil and his *varium et mutabile*. Breakfasts appear at order, as if some law presided over the association of the various things on the tray and their coming up stairs. There is even a generalisation of hot shaving water which seems marvellous. One could almost suppose that boots walk down stairs, clean themselves, and come up again. Mechanical, sentimentless, cold, and unloving is the whole affair, yet how admirably adapted for a general effect in giving comfort and expediting wishes! How excellent entirely in its own way!

Where small inns are tolerably well managed; I feel them to be, upon the whole, more agreeable. If newly started from a home where you are in the receipt of some daily respect as husband, father, and master, it is rather an unpleasant plunge to take your place at once as No. 217, with only a few pieces of human mechanism, in the shapes of waiter, cham'aid, and boots, floating gelidly about you. The greater conspicuousness and consequence which you attain at a small inn, makes the transition less. The gentleman in No. 5 parlour, with his two candles, is somebody. If the portmanteau and the man had alike a respectable appearance, he may depend upon the speculations of both waiter and landlord having taken a turn in his favour; the first practical result of which will probably have been a mission of the landlady to the kitchen to see that cook is sufficiently particular in doing that fowl for dinner. John, in laying the cloth, if he sees anything like an opening, will be sure to prove conversational, remarking probably on the anticipated effects of the railway commencing in autumn, which, he thinks, must for certain cause an omnibus to leave the house and come to it at least twice a-day. Or perhaps we had a great farmers' ball in the big room two nights ago, at which there were such doings. The landlord himself, if you cross him in the lobby, or saunter out upon him in front of the house, is found to observe no chilling distance—very different from the invisible deities of the grand caravansaries. You may soon wind off from him the whole chat of the country side. The landlord of such an inn is generally but a half-occupied man. The lady being always of superior importance in house management, he has no chance of keeping up in any dignity of

duty, unless he has a little farm for raising the provender consumed in the house, in which case he may be enabled to consider himself as a man of some small consequence. From the general operation of this semi-vacuity or enforced idleness, your landlord is usually social and gossipy. Great matter it is for the superior moiety, if she only can contrive to keep him from doing any positive harm.

There is a particular class of inns above all others agreeable—those which, being situated in some favourite haunt of amusement-seekers, have only to endeavour to be agreeable places for the spending of a few days, or even of one day, and their whole function is served. No great posting system, no tavern business, no pell-mell of stage-coaches, no 'commercial gentlemen' to take a lead as customers. Generally situated in some pleasant nook, with an esplanade looking out upon the lake, the vale, or whatever else the place is celebrated for; nice parlours, clean airy bedrooms, very likely a pianoforte in your room; appearances of elegant life in the people of the house, and nothing sordid or shabby in their system of entertaining and charging. Here it is truly delightful to experience that warmth of welcome which belongs to inns—light-hearted ramblings all day—the comforts of the inn in the evening. All the better if the telegraphic wires of the post-office have been cut behind you. Your ordinary world forgot: the whole sense of duty, that usually sits so heavy, thrown away for the time. Alas! what is life to the best of us but a long series of cares, with three or four such little affairs of relaxation interspersed! Inns of this pleasant kind are to be seen at Matlock, at places in the Isle of Wight—Ventnor, for instance—about the Cumberland lakes, and also in our own dear Highlands. Reader, there is a nook of the world called by a name which, ten to one, you cannot pronounce—Drumnadrochit. Nestling in a fine glen near the banks of Loch Ness, it is an inn for a romance. A Shelley might have chosen it as a retreat in which to compose one of his poems. Oxford students do, I believe, haunt it as a fitting place for their summer studies. Of all the generation of pleasant inns, this is by many degrees the pleasantest I have ever chanced to be in, be the rest what they may. It is more like that parsonage which a wagish friend recommended its non-resident tenant to advertise as a proper place for an eternal succession of honeymoon parties than anything else. From the perfect resemblance which everything bears to what you see in an ordinary house—here, too, you find a piano in the parlour—from the kindly simplicity of the attendants, and the neatness and taste presiding over all your entertainments, you feel that you lose nothing in life by being in Inverness-shire instead of at home. Such inns might be expected in some Utopia, where mercenary feelings had given way to universal kindness and mutual serviceableness.

I am not quite sure if it be a wise arrangement which gives landladies in general such a precedence over their lords in the management of inns. It is all very true that, an inn being chiefly a domestic matter, and woman being more especially the domestic sex, we may naturally expect to see the lady taking a leading share of the common duty. I think it, however, a mistake to suppose that there is not full and fitting employment for a man also about an inn. It appears to me that the energy of the male intellect would often be useful in enforcing and maintaining the necessary arrangements, and in taking advantage of circumstances that might redound to the better success of the house. It is unfortunate

that men should think themselves in any case above such duties. Nothing tending to useful results can be beneath a man's regard. Were men of tolerable judgment and intelligence more generally to take a steering hand in the inns of secondary and third-rate importance, they might immensely improve them. By travelling, they might catch up many good ideas, both from the modes of management they would see in other inns, and from the remarks which they heard made by guests about particular arrangements, and the conduct of the several attendants. By exercising a real care in superintendence, instead of only promising to do so in their house-cards, they could effect wonders. The plain truth should be understood by them, that to fulfil their place in life, they must make themselves virtually the servants of those they would hope to profit by. By this we mean that nothing should be omitted which care and trouble can do, to make their guests comfortable—to make the house as home-like as possible for them. There must be no tiring in this kind of well-doing—custom should never stale the infinite variety of little attentions that gratify guests. Grant it is a slavery—are we not all slaves to each other? Who that would eat, escapes the bondage of those from whom he asks bread?

The greatest difficulty is to get good servants. This is the feeblest point about most inns. Of all waiters, how few are cleanly—how few approach the tact and unobtrusive discreetness of a tolerably well-bred man-servant! Landlords little reflect, perhaps, on the shock it gives to a gentleman who is tolerably well served at home, to see his breakfast brought in by a coarse fellow with uncombed hair, unwashed hands, and unbrushed clothes, as often happens. One fault is nearly universal in the class, and it is a sufficiently annoying one—the want of a quiet manner. Some seem to think it necessary that they should walk across the floor with the impressiveness of the statue in Don Juan, and set down every plate and salt-vat with a noise that may be heard over half the house. The unsatisfactory points about waiters are the less endurable when we reflect on their comparative gains. In a well-frequented house, where gratuities from the guests are in practice, the remuneration far exceeds that usually accorded to other men of the same grade in life. Here, indeed, there is a great absurdity. A gentleman calls for a glass of soda-water, is charged eightpence, and gives the remaining groat to the waiter, not reflecting that the man's profit by the transaction exceeds that of his master, who has rent and taxes to pay, a house to keep up, and bad debts to be made up for. The disproportion is owing to the shabbiness which would appertain, in appearance, to more just remuneration. It is a barbarism altogether this plan of securing civility from attendants at inns—the very confession that it is the only way expected to have the result is distressing, as if men were so reluctant towards their professed duty, that nothing but a particular reward for every little act could induce them to execute it. It is not perhaps one of the best effects of the system, that waiters are so often induced by their accumulations to undertake the charge of houses for themselves, while not possessed of the education and knowledge of the habits of the upper classes which are required for such establishments.

There is a national genius for inn-keeping; and it is to be feared that we all fall short in this respect of our continental neighbours. Amongst our own nations, the Irish are ill qualified, the Scotch moderately so, the English the best. The comparison ranks with that of the nations for business gifts generally, so that we may

fairly infer that the English couple make the best landlord and landlady, because they can adapt themselves better than either the Scotch or Irish to that subjection of the external selfhood to the desires and needs of others which constitutes business. The Irishman is too idle for his trade, and follows the foxhounds. The Scotchman is too proud, and skulks into a sort of half farmer or grain dealer. The Englishman, alone able to surrender himself entirely to that by which he makes a penny, goes into the affair with apron and sleeves, and is a landlord in deed as in profession.

THE SCHOLASTIC LOGIC.*

THE words '*scholastic*' and '*logic*' are, to the majority of readers of books, either void of meaning, or exceedingly repulsive. But if, by a vivid historical picture, the agitation of men's minds, the excitement and the interest that have been involved in the things denoted by these terms, were once clearly brought into view, they could not occur in common speech without exciting lively emotion. The principal doctrines that made logic a body of human knowledge, were originated by the greatest scientific mind of antiquity, among a people who took extreme interest in such things, at the same time that they were excessively devoted to amusements and splendour, excitement and novelty. But the reception of Aristotelian forms of reasoning among the Greeks was cold and discouraging, compared with the reverence and enthusiasm they inspired during the latter half of the middle ages, and the earlier part of the modern age—that is, from about the twelfth to the seventeenth centuries. Being applied to the most momentous discussions of religion, and the highest questions of man's social welfare, they assisted in bringing either peace or wretchedness to millions of minds, in staying or forwarding revolutions, and in subjecting the arbitrary will of despots to the universal reason of mankind. It has been truly remarked, that the infallibility of Aristotle supplanted the infallibility of the pope, and paved the way for that liberty of thought, and free use of individual reason, which is now our privilege and our boast. In modern history, logic means the artificial aids that can be given to the human understanding, to enable every man of ordinary sense and education to decide for himself in matters of religion and political right, instead of submitting implicitly to the decision of others.

Like many other things that have done good in their time, and have good in them, scholastic logic has fallen into disrepute, in consequence of its abuses. In the time of its ascendancy, it was completely overdone, and mankind have not yet recovered from the disgust which it produced. And the neglect and disregard of the subject are now so great, that few of us care to know either why it was once so popular, or what was the offence that brought its popularity to an end.

The name is derived from a Greek word signifying originally *speech* or *discourse*, or the communication of thought by language: and logic itself refers to the operations of reasoning that are carried on by means of language or speech. The flashes of thought that are never expressed in words, the instinctive decisions of the lower animals, what we call intuitions and inexplicable impulses, cannot come under the control of logic. A bird chooses the straws and sticks that are to build its nest by the inspiration of nature alone; or if it acquires any experience on the subject, that experience is never expressed in words or artificial signs; it is not a *logos*, nor a subject of logic. And in many of the decisions of the human kind, there is the same speedy, instinctive kind of operation, unconnected with words or speech. A man may see a tree laden with

ripe fruit, and pluck and taste it, noting at the same time its appearance; he may find it to be very delicious, and, in consequence, he may partake of it whenever he meets with it afterwards; and all this time he may never give it a name, nor describe it in any way, nor compare it to anything, with the view of making others know it, nor give a name to the feeling it produced in him. Yet if he recognises it a second time, and pluck and eat in consequence of the previous experience, he goes through a process of *reasoning*. The first instance was a case of knowledge by *experience*, the second a case of knowledge by *inference*; and the native instincts of men always lead them to make such inferences.

But when names are applied to everything, and when we not only derive experience and make inferences for ourselves, but impart this experience to others; that they may have the benefit of the knowledge of the past and of the future which it contains, a new machinery is introduced, an artificial apparatus of immense extent, whose working leads us into a great many considerations that never occur to the humbler animals. We have our affirmations, our denials, our discussions, partial truth and whole truth, sophistry and delusion, misunderstanding and inconsistency, voluntary and involuntary falsehood, confusion and nonsense. Even our inferences, performed by the force of the natural instinct, are sometimes found to be contradicted by experience: our knowledge of the past fails to be a key to the future. And when language is interposed to the extent of constructing arguments, trains of reasoning, and vast complex chains of persuasion, the machinery may become too cumbrous for us, unless it is very carefully managed. In truth, if the working of this immense structure of artificial thinking is not guarded by precautions and rules, it is easy to see that it may produce endless difficulties.

Logic, then, is one of the sets of rules for regulating the use of the machinery of speech. *Grammar* supplies rules for ordering names in groups with a view to perspicuity and facility in speaking and understanding the language, and teaches the uses of the inflexions and arrangements adopted in each particular dialect. *Rhetoric* lays down maxims for giving language its highest possible effect in communicating ideas and sentiments from one person to another: it teaches how to use words for the purposes of exposition, persuasion, pleasing, and for composing the works of art that are founded on speech, such as the various forms of poetry. *Logic* views language solely as an instrument of inference or reasoning, for extending knowledge wider than experience, for discovering the past, the future, and the distant, from the present. In so far as we reason without language, logic does not apply to our operations, any more than grammar applies to the roar of the lion, or rhetoric to the song of the nightingale. But as soon as we put our reasonings into words, or into the form that conveys them to other men's minds, there is a certain fixed character which they must have, otherwise they are bad and inadmissible, and will prove false to nature and fact when the trial is made. The scholastic logic teaches what are the shapes that reasonings stated in words must have in order to be sound and worthy of confidence, so that a man may stake his life and character on the conclusion.

There is a class of people very much disposed to undervalue artificial rules of all kinds, and to uphold unassisted nature as the grand source of healthy action. The greatest works of human genius, it is said, have been produced without the help of rules: Homer and Shakspeare paid no attention to arts of poetry and laws of composition; and people ought to write, speak, think, and act as nature dictates, and then they will do their best. But without entering into the general question as to the comparative merits of the natural and the artificial, it is sufficient to say that man, by constructing a system of articulate speech, has made himself a very artificial creature. He has brought

* Formal Logic: or the Calculus of Inference, Necessary and Probable. By Augustus De Morgan, of Trinity College, Cambridge; Professor of Mathematics in University College, London. London: Taylor and Walton.

himself to communicate feeling, to think, imagine, and create by verbal machinery, and he must receive guidance in the right use of this machinery. The animal that judges by its direct senses alone, cannot go far astray; but man, who stakes his wellbeing upon hearsays and symbols, who believes in the magnitude of the earth from a few rows of ciphers, and in the existence of unseen stars by the force of a series of black scratches on a white surface, must be very attentive to the authenticity of a machinery that seems so liable to abuse.

To suppose that most men can judge of a sound or unsound argument when they hear it stated, without requiring rules of logic, or any artificial help, is a mistake. The ability to judge of a chain of arguments, even in regard to the soundness of the reasoning, apart from the truth of the facts, is not the common prerogative of mankind, or one of the free gifts of nature: it is acquired only in consequence of laborious cultivation. Now, in educating people in this most desirable accomplishment, the scholastic logic used to be the branch of knowledge and discipline chiefly depended on. The scholars at all the universities were regularly drilled and exercised in bringing every kind of argument and proof under the forms laid down by the Aristotelian scholastics, and this enabled them to declare with certainty whether arguments were good or bad. The constitution of the old universities has not been altered; logic is still a part of their curriculum, but it is reduced for the most part to a branch of information instead of drill. The artificial forms of reasoning, which were once the sole matter of the instruction, are now pushed into a corner, and a great part of the session is spent in expounding human nature in general; so that the students are never so completely familiarised to the processes of logic, as to apply them afterwards in the business of life.

The general principle, or great fundamental discovery that logic is founded on, may be understood without much difficulty; although the complete exposition of it would require perhaps about as much time and study as the six books of Euclid. The principle is this: every step of sound reasoning may be reduced to one general form, which exhibits clearly what is the precise thing that is done when an inference is made. To comprehend exactly this universal form of the process of reasoning, it is only necessary to conceive, first, what a *proposition*, or assertion, or affirmation is. A proposition brings together two things, two ideas, or two qualities or attributes, and asserts that these two things are always associated; so that where one is, there the other is also. Thus, 'Clouds obscure the sun,' is a proposition: two distinct things are stated, and they are affirmed to have a certain invariable connection. The thing we call a cloud, is one; the thing we call obscuring, or hiding, or darkening the sun, is another; and it is alleged that the two always go together. In consequence of this connection, we can be sure of the presence of the second by merely knowing of the occurrence of the first. If we are told in history that in the day of a great battle the whole heaven was overcast with cloud, we are sure, without being told, that the sun's body was concealed, and his light very much diminished. Wherever nature has ordained that two things shall always accompany each other, and when man has been able to find out this connection, and state it in words for general information, a proposition or affirmation is arrived at which very much shortens human labour; because by it we can know of the presence or absence of a thing not only by direct experience, but also by means of its accompanying thing. When we have established the affirmation, that prussic acid causes death, if we can prove that one man administered a dose of it to another who has been found dead, we condemn him as a murderer without farther inquiry. We have found that the taking of a certain amount of prussic acid, and the loss of life, are invariably associated by the ordination of nature; and if we are sure that

the first has occurred, we believe in the second, as its effect, with the greatest certainty: and by the help of other propositions, we can establish a murder by prussic acid, although we do not know directly that the acid was procured from a chemist, and drunk by the victim. For it is one of nature's established coincidences, that prussic acid, when acted on by certain other known substances, produces a blue colour, called prussian blue. Now, if the stomach of the dead person is put through a process of contact with these other substances, called tests, and if it bring out the prussian blue at the proper stage, this, in consequence of the invariable connection of the two things, is a proof that prussic acid has been taken. In this way we can know and believe that a thing has been done that we have not seen, or that no living man may have seen.

To pass from the nature of propositions to the nature of reasoning or inference, we have to supply only one other link, and the process is complete. If it be a general proposition that prussic acid destroys human life, the only thing necessary to predict the loss of life in a particular case, is to make sure that prussic acid is really the substance administered. For if it is a general rule that some one thing is always followed by a certain other thing, we have only to establish the occurrence of the first in order to believe in the occurrence of the second. Thus we have a primary proposition that links two things, and a second proposition which makes out or asserts the existence of one of them in some individual instance; and hence the consequence or conclusion is, that the other is present. This is the process whereby we draw an inference in all cases, or acquire a piece of information that is not within the range of our experience. There are, as it were, three different steps in the operation:—The general proposition; the assertion of identity of the subject of the proposition and the subject of a case in hand; and lastly, the conclusion, or the full application of the proposition to the case.

The scholastic logicians, in recognising the three steps now mentioned as belonging to every case of reasoning, gave them technical names, as follows:—The two first assertions they called the *premises*; and the third, as in ordinary speech, the *conclusion*. The first assertion, which is a general proposition or affirmation of the connection of two different things, they called the *major premise*, or the greater proposition; and the second assertion they termed the *minor premise*, or the lesser proposition. Since the first proposition, or the major premise, is the general law of nature, while the second is merely a statement that a particular case comes under it, the first is conceived to be the more important of the two; hence its title of superiority. The entire operation of inference, when formally arranged in its three successive parts, is called a *syllogism*. The reasonings and arguments used in ordinary speech are generally stated much shorter than in the full syllogism, and very often in such a way, that it is difficult to distinguish the different parts that we have here set down; but if ever there be any doubt about the soundness of an argument, the best way of placing it before the mind is to separate it into its three steps of major premise, or general principle, minor premise, or assertion of identity, and conclusion. This is the most advantageous form of looking at the case: the mind is put into the best possible position for judging of the soundness of the inference. It is like judging of a man's affairs after they have been put into the orderly forms of correct book-keeping. For if an argument is unsound, the fault must lie in one or other of three things: the major premise must be untrue, or the minor premise must be untrue, or the conclusion must be something different from what the premises can support. Possibly we may not be able to say, after all, if the conclusion is sound; we may be unable to judge if the primary proposition, or general law, be really true, as is asserted; or we may not be sure if the case mentioned in the second proposition is really a case to come under

the general law; but still we gain a great deal by looking at these statements apart from each other; and we can always be sure if the conclusion is good, for logic teaches all the forms of major and minor premises that can give a sound conclusion, or what the conclusion is that can be rightly drawn from any two premises.

Logicians find it necessary, in speaking of 'propositions, to give names to the two things that are asserted to go together. The thing that is spoken of, when an affirmation is made, is called the *subject* of the proposition; the thing affirmed of it is called the *predicate* of the proposition; and the words of affirmation make the *copula*. Thus, in the proposition, 'The earth is round;' the *earth*, the thing spoken of, is the *subject*; and the quality, *roundness*, is the *predicate*; the word 'is' being the *copula*. The use of these phrases in the syllogism may be illustrated as follows:—Suppose any one were to assert that the new planet Neptune is round, because the planets are all round; the argument in its logical order would stand thus—

Major premise—All the planets are round.

Minor premise—Neptune is a planet.

Conclusion—Neptune is round.

Now if this conclusion is wrong, the error must arise from one or other of three mistakes: either it is false that all the planets are round; or it is false that Neptune is a planet; or lastly, supposing all the planets to be round, and Neptune to be a planet, we are not correct in concluding that Neptune is round. The first two points refer to matter of fact, the third is matter of logic. These three statements being propositions, each must have a subject and a predicate; and there must, moreover, be a fixed relation among the various subjects and predicates. Although there are three propositions, giving in all three subjects and three predicates, yet there must be so much identity in the matter of the propositions, that no more than three separate ideas must be present. These three separate ideas, or things, are called the three *terms* of the syllogism. The predicate of the conclusion, in this case *roundness*, is the *major term* of the syllogism, and it is contained in the *major premise*; the subject of the conclusion, *Neptune*, is the *minor term* of the syllogism, and it is contained in the *minor premise*; the thing common to both premises, *planet* in this instance, is called the *middle term*, being, as it were, the intermediate thing that enables the first half of the conclusion to be joined to the second. Now logicians classify syllogisms or arguments according to the position taken by the middle term. It may be the predicate in both premises, or the subject in both; or it may be the predicate in the first, and the subject in the second; or the subject in the first, and the predicate in the second; making in all four distinct cases, called *figures*. Each figure is subdivided into *modes*, according to the nature of the propositions, which may be affirmative or negative, universal or particular; that is, the proposition is *affirmative* when we say all the planets are round; *negative*, when we say no planet is round; *particular*, when it is 'some planets are round; and *universal*, when all planets are round. There is thus a classification of syllogisms or arguments; and each particular kind of syllogism justifies a certain conclusion, which we are taught by logic, if we do not happen to know it before, as in most cases we must.

The logic of the schoolmen confined itself to showing what were the conclusions that could be drawn from given premises; but in recent times, it has been considered a part of logic, and the greatest part, to judge of the soundness of the premises themselves. The investigation and the proof of general propositions, or the links of coincidences and succession established by nature, which are the foundation of all reasoning, constitute a far more serious and laborious occupation than scholastic inference; that is to say, it is much more difficult to establish general laws than to apply them correctly. This constitutes the investigation of nature, or

the building up of science, which is nothing more than the assemblage of laws and principles that have been already amassed, arranged in heads according to the departments of nature that they belong to. Lord Bacon is for ever associated with the transition from scholastic logic to the logic of investigation. As the one pretends to give the human understanding artificial helps to aid it in judging if a doctrine is accurately applied, or a conclusion properly drawn, so the other gives assistance in the far higher process of finding out and establishing the doctrines themselves, or the laws that all knowledge, and prediction, and inference are founded on. The right modes of observation, experiment, induction, deduction, classification, &c. are expounded in this wider logic; as may be seen in the 'Logic' of Mr John Stuart Mill, which is by far the completest work that has yet been produced on the subject.

Meantime, however, the scholastic logic continues to be cultivated in all its old exclusiveness. The treatise now before us, by an eminent mathematician, is intended to extend and improve the syllogistic process by additional devices, and new names and symbols, or to render scholasticism still more scholastic. There can be no doubt of the ability of the work; and it is a general rule that a man of ability and high cultivation is always worth listening to. But the structure of Professor De Morgan's book is so closely analogous to a treatise of algebra, that nobody can be expected to understand it, or persevere in reading through it, that is not familiar with algebraic processes, or has not a decided aptitude for thinking by symbols. The old logic makes use of letters to express the subjects and predicates of propositions, in expounding the forms of the syllogism: as all A is B, all B is C, therefore all A is C; which is a short and convenient device, serving to confine the attention to the *form* of the syllogism—this being the thing that logic exclusively attends to. The four letters, A, E, I, O, were used to represent the four kinds of propositions, according to the varieties of affirmation and negation, universal and particular. Every syllogism could then be expressed by three of these vowels. The syllogism last stated, containing three universal affirmative propositions, would be expressed AAA; and also by the name *barbara*, whose vowels are three a's. Or if the syllogism were, no B is C, all A is B, therefore no A is C; the first and last propositions being universal negatives, would have for their symbol E; and the second, being a universal affirmative, is A: thus the whole syllogism is expressed by EAE, which, mixed with certain consonants into a word, is *celarent*—the name given accordingly to this species of syllogism. There are nineteen such words, expressing so many kinds of legitimate syllogisms; and these are made into five lines of Latin metre, which have to be committed to memory by the learner. The lines are worth copying here, as many of our readers may never have seen the scholastic compendium of all sound reasoning—

Barbara, celarent, darii, ferioque priors
Cesare, camestres, festino, baroko, secunde.
Tertia, darapti, disamis, datist, felapton,
Bokardo, feriso, habet: quarta Insuper addit.
Bramantip, camenes, dimaris, fesaepo, freisoon.

The nineteen words in italics reveal, by the order of their vowels, the nineteen sound syllogisms: any argument, whose three propositions, when expressed by their letters, do not observe the order of the vowels in one of these words, is not a good argument. Thus EAA, which is not found in any word, is the expression of an illogical syllogism. The words *priors*, *secunda*, *tertia*, *quarta*, are the numbers of the figures that the syllogisms fall under.

Mr De Morgan has introduced a new set of symbols to express the *contraries* of things contained in propositions; as if we had, in addition to the name of every object, a name for its contrary—'Man, not man; black, not black;' and so forth. Using large letters—X, Y, Z—to express things and qualities, he takes smaller letters

—x, y, z—to represent their opposites; and he can thus vary very much the symbolical expression of syllogisms, and in many cases render more obvious to the reader the soundness or unsoundness of every possible form of argument. And he adds a great number of other symbols, with good effect in their way, but all with the great objection—that none but an algebraical mind can appreciate, or be at home in, such manipulations. By rendering syllogistic logic theoretically and symbolically more perfect, he has removed it farther and farther from easy application to the practical purposes of life; unless in so far as his work is studied by the few for their own cultivation, so as to enable them to set good examples of right reasoning to the many.

THE DONKEY DRIVERS.

A SKETCH FROM REAL LIFE.

I LIVE in an old tumble-down house, not a great many miles from London, and on the borders of a furzy common. Before the age of steam locomotion, this was considered the country; and even now, there is one solitary spot where, from mossy knolls rising beneath clumps of antique trees, we overlook a perfectly retired and sylvan scene. A sparkling stream, like a silver thread, winds its way amid rich pasture land and thick beech plantations; an ivied spire, furnished with a peal of soft musical bells, peeps forth from a distant village; and in the summer evening time it is pleasant to rest on those mossy knolls, and listen to the sad distant music.

The ruins of an old church may be traced from this point; wild roses and eglantine are around us, with violets and bluebells; a sweet honeysuckle porch is seen leading to a lowly-thatched hut; and there are lowing kine and bleating flocks by our side and in the distance. In this there is nothing wonderful; but only turn back not many hundred yards, and seek another point from whence to view a very different and more widely-extended panorama—the vast wilderness of London, St Paul's, Westminster Abbey, hosts of steeples, myriads of chimneys, armies of masts and shipping clustering on the almost choked-up and hidden river, good old Thames: in fine, smoke, fog, and misery without end! Seen from this common, *there* the sun sets; but the holy moon rises from behind the tall trees and the old church, which I can reach in less time than I have taken to gossip about it. Royalty for many years found a secluded and peaceful home on this ancient common, famed alike in history and legendary lore; but I know not if the ears of royalty were ever assailed by the same unearthly yells and hootings which so often disturb our retirement, and remind us of the descriptions we have read of the war-whoops of the Indian savages. The explanation is, that there are several stands of donkeys, where these animals are let out for hire, on different parts of the common; and the general assemblage, or grand emporium, is close to the garden wall which bounds the domain once honoured by a royal presence.

One evening during the past summer, as I was returning from a ramble by the side of a dear invalid, who was drawn about in a hand-carriage, two ragged little girls loitered around our gate from idle curiosity to watch the occupant of the pretty green chariot assisted into the house. I was struck by the appearance of the elder of the two; for although with a quantity of matted black hair, a very dirty face, and still dirtier habiliments, I could trace a singular loveliness both of form and feature. She had large, languishing blue eyes, shaded by long, black, silken lashes; but notwithstanding this, the gipsy physiognomy was decided; and as there were many of that tribe in the neighbourhood, I doubted not that these vagrants were wanderers from their tents. After regaling the poor little things with some tempting cakes, I asked the beauty her name, when she answered with distinctness and propriety, 'Mazelli Lee, please ma'am.'

'And what is your father, my dear?' I said.
'Father's a gipsy, please ma'am.'
'And your mother is a gipsy too, I suppose, my dear?'
'No, mother's a lady, and drives donkeys, please ma'am.'

I pressed the child to try and explain her meaning; but all the answer I could get was, 'Mother's a lady, and keeps donkeys.' She made me comprehend that the smallest and most *exclusive* donkey-stand on the border of the common, nearest our house, belonged to her mother; and that her only brother, a little bigger than herself, was also an assistant in the business. She said their home was not very far off—in the pits near the caverns, where a miserable collection of huts had been from time immemorial. Moreover, on questioning Mazelli further, I found she regularly attended the Rev. Mr L—'s Sunday school, knew her catechism, 'and said her prayers every night, when mother washed her face.' I hoped that a portion of the latter statement was true; but the face-washing seemed quite incredible.

My curiosity was aroused; and the next day I walked close past the donkey-stand, which Mazelli Lee had described as being kept by her mother, 'the lady;' and then I observed an individual whom I had often seen before, but without noticing her particularly, or giving her a second thought. This individual was a woman still young and good-looking, with the fresh colour of unclouded health lighting up her blue eyes—eyes almost as beautiful as the little Mazelli's—and with an anxious expression fitting sometimes across the vacant but good-humoured composure which was the leading character of her countenance.

Her appearance was not at all that of a conventional heroine of romance; yet I could not help fancying that there was somewhat of different breeding, shown by her general bearing and unstudied attitudes, from that usually displayed by the race of females engaged in her boisterous calling. Her two little girls were squatted on the grass beside her; and a handsome specimen of a real genuine-looking, good-for-nothing gipsy man was loling at his ease near the group, in supreme enjoyment of a pipe. I did not like to speak to the mother and her daughters under these circumstances, because, not patronising donkeys, and being an inhabitant, it was not a very agreeable or perhaps safe acquaintance to form; but Mazelli knew me directly, and came bounding forward, while the woman curtsied silently, and without the usual vociferations of, 'Donkey to-day, ma'am? Steady donkey—quick donkey!'

One or two evenings afterwards, I was in company with a voluble lady who had come to our neighbourhood for change of air, and was ordered by her medical attendant to take donkey exercise. She was full of a 'most singular adventure she had met with—a perfect romance in real life;' and her gossip, to my great satisfaction, related to the donkey-woman. 'Yesterday morning,' said she, 'my young friend Miss R—and myself had donkeys brought to our door early for a long excursion; and while trotting along, attended by a frank, rosy-looking female, we began speaking to each other in French, not wishing the driver to understand our conversation. After a while, however, the donkey-woman said very quietly, "Ladies, it is as well to tell you that I *understand French*." We were at first speechless from surprise, and then from not knowing what to say—afraid of something, we could not tell what; although she was by no means intrusive, but behaved with perfect propriety. By and by, in order to break the awkward silence, I remarked to Miss R— how well the singing had been conducted at St Mark's church on the preceding Sunday evening, when a very beautiful choral hymn had been sung, and the chanting exquisitely continued. We regretted that neither of us remembered the composer's name, as we desired to procure the music.

"I have it at home, ladies," said the donkey driver: "it is taken from an old oratorio, and is part of my

school music. I was at St Mark's on Sunday evening, and felt pleased to hear it again."

"She then offered to lend us the music in question; and this was modestly and simply said, just as if we must know her history, and therefore ought not or need not feel astonished at such discrepancies. However, when we did express our surprise, she simply narrated her story, which is this:—She was the only child of a wealthy farmer by his first marriage, and her mother dying during her childhood, she was placed at a boarding-school for young ladies, where she received the usual education. But she was idle, and hated learning; and when she left school, and returned home, she found a stepmother, who did not treat her kindly, and became a severe taskmistress to her thinking. A troop of gipsies coming into the neighbourhood, she secretly formed their acquaintance; and in the end eloped with their chief, Mr Johnnie Lee by name, and became his wife. After leading a wandering life for many years, she had induced her husband to settle here, from a desire that their unfortunate children should receive a "Christian education," as she termed it, and also because a relative of her husband's was a flourishing fly-proprietor in the vicinity, and might forward their views. But her husband was a rover by nature; idle and careless; and all she had been able to do was to establish a donkey business, and to attend to it herself. She declared that the pure air, and the untrammelled freedom of her mode of life, was suitable to her taste; and we pressed her no farther, poor creature!"

Such was the tale I heard; too singular and improbable for a fictitious narrative, too extravagant for invention. It induced me to pay a visit, after the hours of donkey usage were over, to Mr Johnnie Lee's hut 'by the faverias.' I knew by previous observation that 'the pits' contained wretched hovels, and still more wretched inhabitants; but the one I now entered was worse than I had ventured to anticipate. It consisted of only two rooms; the under one with a mud floor, and with the ceiling broken, and the upper flooring projecting through. I did not ascend the ladder leading to that, for I saw quite enough below to surprise and bewilder me. A scene like this so near my own comfortable home, and in the midst of the rigorous proprieties of conventional life!—and a woman of nearly the same grade originally as myself, of nearly the same bringing up, thus outraging the common decencies of life! How far beyond the saddest tales of romance or the wildest visions of fancy! Her three children were around her, supping on potatoes; but there was no snowy cloth on the tottering board, no cleanly basins of new milk, no fresh flowers in wicker-baskets; nothing as it would have been were I relating *fiction*. Outside there were no honey-bees or garden-plots, where sweet thyme, and mint, and sunflowers grow; nothing but foul donkey sheds adjoining, where, amid damp fodder and noisome stench, rested the weary animals ere they were turned out on the common to shift for themselves during the night. The gipsy husband was not there. I did not ask for him, for I guessed his haunt but too well. It was an 'owre true tale' I had heard, and this was the moral.

Johnnie Lee's wife opened a chest which stood in one corner, containing the rags of the family, and amidst them lay concealed her sole earthly treasures—her father's miniature; some school-books, with her maiden name inscribed in them, which I forbear recording; and some torn and yellow-looking music—the music which she had offered the loan of to my acquaintance. She gave me no farther explanation; made no comments; but she did confess, that if it should please God to afflict her with sickness, she knew not what would become of them. To her own father and family she had been the same as dead since her disgraceful elopement. She had indeed purchased pure air and untrammelled freedom at a fearful price! Poor thing! with a smile on her lip, but with a tear in her eye, she added, 'I do wish my children to receive a

Christian education; and when I look on them, particularly on my little Mazelli, and remember their inheritance, I dare not think. But I have chosen my lot. My husband does not beat or ill use me; he has given up many bad practices for my sake; and if he is rather fond of the shelter of the public-house, ought I to complain of that? Do not shed tears for me: I have no feeling for myself.' And she said truly. A woman destitute of feeling seems an anomaly in human nature; but this she *must* be, and fine sympathies are wasted when expended on her. But for the poor little children my heart still bleeds. Gentle blood flows in their veins, for the ties of relationship cannot be broken; and what a curious family party would be formed of the mingled race: the most decorous and prosperous of the middling-classes of the community in juxtaposition with the refuse of humanity—thieves, vagrants, tinkers, and donkey drivers!

SOME PASSAGES IN THE LIFE OF A PRESBYTERIAN VICAR.*

A FEW years ago, a society was formed in Manchester for the publication of antiquarian remains, historical, biographical, and political, relating to the counties of Lancashire and Cheshire—counties which afford an unusually favourable field for the exercise of that growing spirit of research into the past, of which societies of this nature are an indication and expression. The present is the fourth volume that bears the *imprimatur* of the Chetham Society, together with the impress of the armorial bearings of the individual after whom it is named; to whom the town is indebted for a most valuable public library, placed in the long galleries of the college, also founded by him. Within these ancient walls, in quiet seclusion from the commercial noise and turmoil without, we have passed some pleasant hours, surrounded by 'the mighty minds of old'—huge tomes in their old wooden bindings, and manuscripts rich with the gay lining of the middle ages, on which, through 'storeyed casements,' fell the varied lights of such sun as is permitted the inhabitants of that well-smoked metropolis of the English manufacturing districts.

Adam Martindale was the Presbyterian vicar of Roseterna, a village in Cheshire, whose church and beautiful sheet of water—the *Mere*—are well known to all lovers of the quiet rich scenery in that district. Humbly born, to a great extent self-educated, and retaining through life his original homely simplicity, combined with strong sense and shrewdness, he has left the stamp of his mind and heart in this account of his own life, which is printed from a manuscript in the British Museum. A diversified and somewhat stormy life it was, as must inevitably have been that of one who lived during the Great Rebellion and till after the Restoration, and who was called on to take part in the turbulent events of the time. Embracing the Parliamentary side almost by accident, he seems to have adhered to it without bigotry, and to have borne with wonderful patience the reverses that came upon him on the decline of its brief ascendancy; while his lifelike sketches of domestic details afford a most vivid and entertaining view of the character of this honest Lancashire man, with his good heart, and keen eye to the main chance, and likewise of the manners of the higher classes, and of the common people, in the middle of the seventeenth century.

As we prefer the *life* to the *times* of our vicar, we shall not touch on the latter, save just to remind those who, luxuriating in liberty which has descended to them as an inheritance, are becoming thankless for it—of the rich price paid for that rich gift; in blood, noble and ignoble, poured out like water; in broken

* The Life of Adam Martindale; written by Himself. Printed by the Chetham Society. Edited by the Rev. H. Parkinson, canon of Manchester.

hearts and desolated homes; in public sorrows and private griefs; in reckless license and military despotism—a strange formulary for the composition of freedom!

And now to our book, from which, as it is not accessible to the public, we shall extract the more largely, occasionally condensing our author's somewhat diffuse details. Chiefly we intend presenting the leading incidents of Martindale's daily life, his home cares and joys, passing over, or nearly so, both polemics and politics, as foreign to our present purpose. It must be said, however, that he had his full share of the disputations of the day; and in that day toleration was ill understood. To the Presbyterians it was only known as a 'snare of the devil' and 'work of Satan,' which they, in their zeal, eschewed as uncompromisingly as ever did Romish inquisitor, who, having the power, made short work of it by burning his heretics, instead of deluging them with fierce pamphlets and hissing-hot divinity. Martindale himself, who must be reckoned somewhat of a liberal, at the very time that he was suffering from the laws against Separatists, tells us that he 'did so little like a universal toleration, that he had oft said that if the king had offered him his liberty upon condition that Papists, Quakers, and all other wicked sects should have theirs also, he thought he should never have agreed to it; though, when it was offered (as probably most others would have done), he found a loophole by which he saved his consistency, while he took the benefit of the act.

The first seven years of his life, of which he gives a minute account, passed much like those of every other child—sundry accidents, broken heads, narrow escapes from drowning, learning his A B C by the help of his 'brethren, and a young man that came to court his sister;' and his great love for his book after that first and formidable difficulty was overcome, make up the recital. But towards the close of it, he tells us, 'there fell out a grievous and troublesome business to our family. There had lately been a great plague in London, causing many that had friends in the country to come down, who, having employments to return unto, were full as hasty to return as consistent with safety; and my sister Jane having conversed with some of them, was as forward as they. Our parent, and other prudent friends, were against her going for many reasons: 1st, She wanted nothing at home, nor was likely to lack anything; and had she had a mind to be married, my father was then in a good ordinary way to prefer her: 2d, She had no friends in London to go to [with others as to health, &c.]; but all these would not back her: she measured not a competency by the same mete-wand that they did. Freeholders' daughters were then confined to their felts, petticoats and waistcoats, cross-handkerchiefs about their necks, and white cross-cloths upon their heads, with coifs under them, wrought with black silk or worsted. 'Tis true the finer sort of them wore gold or silver lace upon their waistcoats, good silk laces (and store of them) about their petticoats, and bone laces or works about their linens. But the proudest of them (below the gentry) durst not have offered to wear an hood or a scarf (which now every beggar's brat that can get them thinks not above her), nor so much as a gown till her wedding day; and if any of them had transgressed these bounds, she would have been accounted an ambitious fool. These limitations, I suppose, she did not very well approve; but having her father's spirit and her mother's beauty [what a concise and expressive delineation of character!], no persuasion would serve, but up she would to serve a lady, as she hoped to do, being ingenious at her needle. But when it came to a going indeed, my mother's heart had like to have broke for extremity of sorrow; and indeed there was great cause for it, seeing how irregularly her daughter broke away from her.

'After her arrival in the city, she was quickly infected with the pestilence, yet it dealt favourably with her; but though the pest was over, the plague was not,

for she was still kept shut up, and her money grew very low. Then, with the Prodigal, she thought upon her father's house; yet knowing upon what terms she had left it, she concealed her straits from us; only in a gentle [genteel] way she writ for a goose-pie to make merry with her friends, and a lusty one was immediately sent her, cased in twig-work; but before it could reach her, or the money that was sent with it to make her friends drink as well as eat, that the goose might swim without her cost, her money grew so near to an end, that she had thought to sell her hair, which was very lovely both for length and colour; at which instant a gentleman that went up in her company being fallen in love with her, supplied her for the present, and shortly after married her. He had been well born and bred, but was master of no great matters in the world. They were thought very fit to keep an inn, as accordingly they did at the George and Half-Moon without Temple Bar. This cost my father's purse to purpose in helping to set them in house; and my mother rarely failed any the return of the carrier, to send them up country provisions, such as bacon, cheeses, pots of butter, &c.; nor did this at all trouble her, but ever when she thought of the necessitous condition of her daughter at her coming up, and her follie in concealing it from her, it even cut my poor mother to the heart.'

After this our hero was sent to school, and seems to have fallen into bad hands, from the account he gives of his masters. He is severely critical on their qualifications; but his five reasons for not getting on with his learning, were certainly enough to make him rather acid, and he was evidently not accustomed to mince matters. 'The hindrances to my learning in this seven years of my life were many: as, 1st, Many teachers (five in seven years); 2dly, These none of the best; 3dly, A tedious long method then and there used; 4thly, Dullards in the same class with me, having power to confine me to their pace; 5thly, Many sad providences making great gaps in this seven years, as will appear hereafter.'

But we must hasten to relate another 'grievous business' that befell this most unlucky Martindale family:—'About this time my father met with a great disappointment in the matching of mine eldest brother. My father was not so severe as to expect he should bring him a fortune suitable to what himself had got, yet an hundred or six score pounds would easily be answered with advantage enough, and therefore not difficult to be obtained; nor was it, for besides others that it was thought would bid him welcome, there was one that actually did so, that had seven score pounds to her fortune, of very suitable years, and otherwise likely to make an excellent wife. But when things were near accomplishing, he on a sudden slighted her, and sets his affection on a young, wild, airy girl, between fifteen and sixteen years of age, an huge lover and frequenter of wakes, greens, and merry nights, where music and dancing abounded; and as for her portion, it was only forty pounds. This was a great surprise upon us, and we were all full bent against it. But say and do what we could, he was uncounsellable—have her he would; and at last, with much ado, he procured my father's unwilling consent, and married her. 'Tis true, indeed, she proved above all just expectation, not only civil, but religious, and an exceeding good wife; whereas the other he should have had, proved (as I have heard) as much below it. But that was the effect of God's great and undeserved goodness—not any prudent choice of his; and the smallness of her fortune was a great prejudice to our family.'

But now the first trumpet-note of civil commotion peals on our friend's ear with a significance not to be misunderstood. He gives it graphically in few words, after announcing his being ready for the university. 'But the university was not so ready for me; wars being coming on that soon after turned Oxford into a garrison, and many scholars into soldiers. It is true things were not then come to such an height, but

working fast that way. Great animosities were set on foot concerning monopolies and ship-money. Shortly it was generally thought, that if a parliament did not heal us, we should break all to pieces; as accordingly it proved.' Disappointed in his expectation of going to Oxford at that time, he turned tutor; and the first family in which he lived affords a fine specimen of character and manners.

'In this interval Mr Skevington of the Booths sent for me to teach his children, and to read prayers in his family, and this was all I undertook; but afterwards he put such variety of business on me, and involved me in such trusts about his housekeeping, that sometimes I have not gone to my naked bed [had not undressed] for a week together. Besides, he was very high and tyrannical in his carriage towards me. Many a time hath he chidden me severely for not doing such work as he required of me, when he himself, by employing me about other business, had rendered it impossible; and were I never so innocent, I must not answer for myself; for if I did, he would presently hit me on the teeth with this—that servants must not answer again; urging that text, Titus, ii. 9, in the most rigid sense, so as to make it inconsistent with common justice. His sons also gave me great occasion for exercise of patience, for they were just like him; and so encouraged by their parents and flattering servants, that I would almost as soon have led bears, as take charge of such ungovernable creatures; and yet it was expected at my hands they should profit highly.'

All this, however, he endured, on account of the unsettled state of the times, which rendered any employment—even tutoring at Mr Skevington's—better than nothing, till increasing tumults caused the household to be broken up, and he returned home to find things in a sorry condition. Between Parliamentarians and Royalists, this unfortunate family seem to have found themselves greatly perplexed. His sister was married to a Royalist, and, going to live at Lathom, which the Parliament's forces accounted their enemies' head-quarters, were sadly plundered by those forces passing the road where they lived. In the following account of what befell his own household and neighbours, he gives a melancholy picture of the miseries of civil war; of the miseries which it inflicts even on those who have no concern in it, and would fain be quiet; and of the mere accidents that may, and usually do, determine the common people in their choice of sides. There is something very touching in the simple recital:—'The great trade that my father and two of my brethren had long driven was quite dead; for who would build or repair a house when he could not sleep a night in it with quiet and safety? My brother knew not where to hide his head, for my Lord of Derby's men had taken up a custom of summoning such as he, upon pain of death, to appear at general musters, and thence to force them away with such weapons as they had, if they were but pitchforks, to Bolton, the rear being brought up with troopers that had commission to shoot such as lagged behind, so as the poor countrymen seemed to be in a dilemma of death either by the troopers if they went not on, or by the great and small shot out of the town if they did. This hard usage of the country, to no purpose (for what could poor cudgellers do against a fortified place?), much weakened the interest of the Royalists; and many yeomen's sons went to shelter themselves in Bolton, and took up arms there.'

After this, events came on so thick, that they made a man of the lad—a process which he stood better than many on whom the raw manhood, thus suddenly thrust, was but the induction to living brutality, or an unblest grave hastily closed on the young limbs and scarcely pulseless heart. He first sought out a school, and remained for a while master, first at Holland, and then at Rainforth; but finding sundry inconveniences at this latter place, he left it, and went to live as clerk with Colonel Mone, in the Parliament's service: and here he gives us a precious sample of a Roundhead's family.

'It was,' he says, 'such an hell upon earth, as was utterly intolerable. There was such a pack of arrant thieves, and they so skilful at their trade, that it was scarce possible to save anything out of their hands. . . . Those that were not thieves (if there were any such), were generally desperately profane, and bitter scoffers at piety.' These gentry succeeded in making him so thoroughly uncomfortable, that he was glad to take a worse place as chief clerk in a foot regiment, where he was speedily induced to take the Covenant, the chaplain being commissioned to satisfy any who should scruple so doing.

He was with his regiment in Liverpool when that place surrendered to Prince Rupert, and was imprisoned for nine weeks, in addition to losing everything. After various chances and changes, we find him again keeping school; and here, at Over-Whitley, Cheshire, an incident, which he styles a 'diminutive cross,' befell him, which we must give entire, both as illustrative of the *manners* of the time, and of his exquisite way of telling a story:—'A gigantic fellow that, by the favour of a colonel, had been captain of horse (though never fit to be a corporal), married a widow, whose children were free, as daughter-in-law of the founder. But this would not satisfy him. I must either receive and teach freely three children of his by a former wife, or he would force me by club law, threatening hideously how terribly he would bang me, making no question of the feasibility by reason of the vast disproportion of our statures, and his resolution to get as great advantage of the weapon. Nothing would down with him, but do it I should, or he would pay me off soundly. I was unhappily infected, either by the breed I came of, or by being among soldiers so long, with a martial spirit, that I could not understand and answer such language to his satisfaction, but took mine own way. Hereupon one Saturday, as I came from the school, without any weapon save a short hand-stick about a yard long, he met me, and, after some rhodomontado language, which I despised, he let fly at me with a long staff. I, being very nimble and strong for my pitch, ran in upon him, receiving his blow upon my shoulder, where his staff, lighting near his hand, did me no hurt at all; and I forthwith clasp my mine arms about his middle, threw him down into a sandy ditch, where we wrestled, and fought, and tugged it out for near an hour together, sometimes one, and sometimes the other being under, during which time a child about four years old carried away both our staves, and laid them across a pretty distance from us. When I had him at advantage, I never offered to do him any considerable harm; but when he got any advantage of me, he most maliciously attempted to rend my cheeks with his fingers and thumbs; but it pleased God to enable me to loose his hold so quickly, that I quite escaped that which, if it had succeeded, would certainly have put me to a great deal of smart and cost in the cure, and probably have disfigured my face sadly, if it had not also spoiled my speech, as the like did to a bayliffe that I knew, that could scarce speak intelligibly afterwards. But two of his workmen in the next field were aware of us, and finding me upon such terms with their master as they little expected, pulled me off him, and held me while he fetched his staff, and valiantly knocked me down and broke my head most terribly, and also gave me so many bangs upon the arms, that when afterwards he commanded them to give me mine own stick, I could do nothing with it, nor scarce hold it in mine hand. Yet, blessed be God, nothing was broke but the peace and my pate, which, without any cost, was speedily well again. I was very sensible the law gave me advantage enough; but I being perfectly well again, and not in the least damaged in mine estate or reputation, took all such courses for pure revenge, and would make no use of them; and indeed the intolerable shame that fell upon him was so great a punishment, that it would have been follie to have exacted any more.'

Martindale seems to have been heartily tired of sol-

dying, such as it was; and leaving the Parliamentary army, tenders, somewhat apologetically, reasons for his joining that party, which must be admitted to have been such as were not unlikely to determine his choice. Circumstances will, after all, influence the generality of men, more than abstract right or wrong; and for this reason, if no other, that all can form some judgment satisfactory to themselves from the former, while few are competent to pronounce on the latter. We can sympathise with him when he urges, in favour of the cause which he had embraced, that all the ministers in the neighbourhood (except two tipplers), and 'serious' people generally, declared for its justice.

But more serious discomposures were in store for him. He takes steps for entering the ministry, and sorely is he teased with the polemical squabbles of the day; between the Presbyterians—fresh beginning to reel in the saddle into which they had vaulted, and stalwart Independency, then in its first youth and strength. Gorton, whither he went to make trial of his qualifications, he describes as a 'waspe's nest,' being there particularly teased by one old gentleman, who, in his hasty zeal to get him ordained, was willing to heap a variety of benefits upon him, including his daughter for a wife—a kindness of which it appears the young aspirant did not avail himself. It was not till three years after this, and with much ado, for he seems constantly, both in secular and spiritual affairs, to have had an adverse fate contending with his purposes, that he received Presbyterian ordination, and was settled at Roseterne. Previous to this, he had 'married Eliz. Hall; and within the compass of eleven years, it pleased God' to give them four children, and 'to take three of them to himself again.' And of these he speaks in terms of tender affection. His father also dies. 'Considering how good a father he had been, and how fashionably, in the time of his prosperity, he had lived among his neighbours, we thought it convenient to bring him home handsomely out of his own, and so we did. For all that came to the house to fetch his corpse thence (beggars not excepted), were entertained with good meat, piping hot, and strong ale in great plenty. Then at Prescott, where he was interred, and the souls of the auditors feasted with an excellent sermon, there was a rich dinner, ready prepared at a tavern, for the kindred, and so many more as a great room would receive, with plenty of wine and strong drink, and for all the rest, tag and rag, sufficient store of such provisions as are usual at ordinary burials. Yet all this came to no very great matter, being discreetly ordered. So that I am persuaded some funerals have cost twice so much that have not been so creditable to the cost-makers.'

Martindale got into some trouble, as his hap generally was, by Sir George Booth's rising in 1659, the Presbyterian party being then dissatisfied with what he calls 'that Protean, vagrant government by a succession of usurpers.' Nay, our Parliamentarian waxes so loyal as to say that if 'usurpers' would continue his liberty, and 'a king and free parliament' oppress him, he would still vote for the latter; but he had wit enough to see the small chance there was of any good being effected by that ill-digested movement—for the failure of which he assigns very sufficient reasons—and so kept himself clear of it. The Restoration he passes over slightly; but it was a beginning of more sorrow to him; and it is worthy of remark how the restraint of his own liberty, and that of other Separatists, was brought about by the excesses of the wilder sectaries. Liberty has no worse enemies than its mad friends. But he was now on the lowest side of the wheel; and some neighbour squires were determined to make him feel the worst of his position—worrying him with legal interference, hurrying him hither and thither, and finally imprisoning him at Chester, 'where,' he adds, with characteristic regard for his pocket, 'the charge was at first considerable.' But he finally got out of the scrape with less hurt than might have been expected, through the

kindness of Lord Chancellor Hyde, who, being interested on his behalf by Richard Bacter, 'did so rattle' one of the deputy lieutenants, that his discharge speedily ensued. It is painful to read of such injustice; but 'they who play at bowls'—And Martindale was no exception to the truth of the proverb.

The 'act of uniformity' turned our friend out of his living somewhat uncereemoniously, seeing the Book of Common Prayer, by some blunder, did not come into his parish till *after* the last Sunday allowed for its reading by those who would conform! But he bears him gallantly through the storm, and with praiseworthy meekness continues to attend the ministrations of his successor; repeating his sermons in the evening to his own household, who, he tells us, rather preferred them thus at second hand. However, there is a bright side to everything, for he adds, that he believes the act saved his life, by taking him off employment too heavy for him. Another blow succeeded this first; and in his distress he betook himself to teaching mathematics, in which he excelled, though applying to the study so late in life. This fresh calamity was the passing of the Oxford act in 1665, whereby Nonconformists were banished five miles from corporations. He then removed his family to Roseterne in Cheshire, going himself to teach mathematics in Manchester, where he seems to have been kindly treated, being left unmolested even by 'high Episcopal men,' justices of the peace, who, though aware of his preaching in the neighbourhood, were unwilling, it appears, to deprive themselves of their mathematical tutor, whom they 'paid nobly' for their instruction.

Martindale seems to have had much trouble and anxiety with his son, who ruins himself in London much after the fashion of a modern wiseacre. It is painful to note how little invention we have, but that even our follies must be copies of those of our forefathers. Our very *slang* is not our own; for it appears that the phrase by which we designate such dexterous gentlemen as the one who relieved our student of his cash, is at least as old as this poor 'pigeon.' Certes, your 'mere scholar' is not good for much, if he is to be taken as a specimen. He had been appointed chief usher in Merchant Tailors' School, London, and was taken much notice of by those above him. 'But this, alas! undid the young man, by lifting him up above himself and the advice of his best friends. He was never given to intemperance, but he made up a club with a number of men of such great estates, and that treated one another in their turns at such a rate, as his comings-in would not bear. Besides, he being a mere scholar, that was always used to have his cloaths bought and kept in repair for him, and knew not how to buy a pair of gloves, when he came to wear rich cloaths, being subject to be cheated by every one he dealt with, the charge of maintaining himself in habit fit for such company was considerable. Finding these things too weighty for him, he makes a full account he could easily help himself by a personage or a wife; and so he might have done, had he taken wise courses and God's blessing along with him. One young woman that had L.500 to her portion he lost merely through a slighting humour. Another at Brentford, that had more than I think fit to speak of, was (as I was told) very fond of him; but because she was a little crooked (forsooth), he would not have her. At last a rook tells him of a great fortune at the other end of the town—a gentlewoman that waited on two young ladies—and makes him believe she had L.600 to her portion; and if he would send him a bond of L.10, he would help him to obtain her. He did so, and after paid the money; but never had so much with her that I heard of. And now he had done his business thoroughly, having himself to provide for, and a wife without a portion to be maintained like a gentlewoman.' He had so disoblighed his best friends by this marriage, that there was no hope of the governor's keeping him in his place at Merchant Tailors'; 'yet, however, they pitied him, and bestowed a gratuity on him at parting

of L5.' Presently after this, he was again settled in a school at Lynn, and his father gives him some advice, that loses none of its value through age.

'As for his preaching, I prevailed upon him to do it plainly to the edification of his people, and not to preach himself as he did at his first setting out. And if some of his matter were sublime and uncouth [a strange junction of terms!] to such ears, and his enlargement in the university style, I question not he would in time have come to be more plain and affectionate for the good of the vulgar. In 1679, he entered upon his place at Northwich (called Witton School), which put me into a necessity of affording him fresh assistance. I therefore gave him some household goods, lent him others (which proved gifts in the event), and furnished him with money to buy such as I could not spare. But, alas! all was suddenly dashed, for he enjoyed this place only ten months. There was in the town a very mortal fever, whereof his wife fell exceedingly ill; and he desiring her life, and fearing her death, begged of God that he might die in her stead, and was taken at his word. His corpse was accompanied from Witton School to his grave with many gentlemen, and other fashionable persons. But none suffered so much by his death as I and mine; for I did not only part with an only son in the best of his time (about thirty years of age), whose education had cost me so dear, . . . but also I sustained considerable additional losses:—For, 1st, He was the only life in my lease of this tenement, save only his mother, who was then fifty-nine years of age—a very considerable loss; 2d, The money that he owed me, and the goods I lent him, . . . came to near L40; 3d, I have kept his child ever since, and I would not take any man's L30 to do for his child what we have already done for it, and are farther to do whether I live or die; so that, upon a moderate account, this last loss (after all the rest) may well be computed at L80 or L90; besides the charges of the funeral, which those that observed it will say was handsomely done.'

What a mixture of the pathetic and the thrifty! The trouble of losing an eldest son just settled in life, and also losing some L80 or L90 by his death, besides his funeral expenses! But then the consolation of having him followed to his grave by 'fashionable persons!'

The next is *rich*. If the shrewd chaplain (he was then living in Lord Delamere's family) had been allowed to manage matters, a better bargain than this would have been struck with my Lord Conway, who got his L5000, but seems to us to have earned a cudgelling, than whom none would have administered it more heartily than Martindale.

'About this time the Earl of Conway married that virtuous and religious lady, Elizabeth, daughter of my Lord Delamere. There was great rejoicing at this marriage, he being a person of so great dignity and estate; but for my part I was much troubled and unsatisfied. The truth is, I liked not the man, for several weighty reasons; and I was utterly against the giving of L10,000 portion, absolutely, without any exception, whether she lived or died, leaving any issue or none. This I thought unreasonable, and more than could well be spared. The next summer, the religious lady (an hundred times too good for such a man) dies while he was proling at court in a gainful office for money, and would not come down to her funeral, pretending excess of grief; but, however, it was soon past; for within a few weeks (as I remember, five), this excessively mournful lord took another comfortable importance, marrying a young, airy lady. After much ado, and long waiting on his lordship's pleasure, at last he declared he would be so kind as to take only L5000 for nothing, and assigned the other L5000 to my lord's youngest daughter, the Lady Diana.'

But the close of his eventful career is now at hand, and things grow worse instead of mending. Misfortunes rapidly follow each other, more than we care to transcribe: among the rest, the burning of his son-in-

law's workshop and barn; the loss resulting from this accident, as usual, falling upon the poor old man. The memoirs close with a lamentation upon the deaths of 'many worthy men of the nonconformist persuasion, that within a year, or little more, had left their earthly habitations in Lancashire for a better in Heaven. When God is housing his sheep (or rather his shepherds) so fast, it is a dangerous prognostic of a storm ere long to ensue.' The manuscript here ends abruptly. All that is further known of him is from the parish register at Roseterne, where the burial of Adam Martindale is entered, 'September 21, 1686.'

THE YOUNG ACTRESS.

SOME time since, a beautiful young girl made her first appearance on the stage of one of the minor theatres in Paris. Her grace and loveliness attracted admiration, which her rising talent promised to secure. She concluded a long engagement with the manager, giving her services for a very moderate remuneration, but which sufficed for her wants and those of an invalid mother, who was totally dependent on her exertions. According to the usual custom, a clause in the contract stipulated that a forfeit should be paid in case of its non-fulfilment by either party.

Theatrical managers never fail to insert this article in the treaties signed by their actors; and it often happens that a very small salary is accompanied by an immense forfeit. In this case it was fixed at ten thousand francs; but the young actress attached no importance to the amount, being fully resolved to fulfil her engagement, and steadily apply to the cultivation of her powers. She felt how much depended on her success, and on she walked in the right path, refusing to be turned from it by the flattering vows and insidious homage which she daily received. But in our uncertain world the good and the prudent may sometimes change their plans as suddenly as the foolish and the fickle.

One day the young actress entered the manager's room, and announced to him that she wished to leave the theatre.

'How!' cried he; 'you are the last person from whom I should have expected such caprice.'

'Indeed, sir, it is not caprice.'

'Is it, then, the offer of another engagement!'

'It is, sir, and one which I cannot refuse: it is from an excellent young man, who wishes to marry me.'

'Here's a pretty business; a marriage in question!'

'My happiness for life, sir, I feel is in question.'

'Then don't hesitate an instant; marry at once.'

'But the person who has proposed for me, would not wish his wife to continue on the stage.'

'A fine prejudice forsooth! What is his situation in life?'

'He is at present a merchant's clerk, but he intends to set up in business, and he will want me to attend our shop.'

'My dear child, I shall want you also to study your part in a new afterpiece which I have just received.'

'Then, sir, you refuse to set me free!'

'I must think about it. At all events, you have it in your power to break the agreement by paying the forfeit.'

'Ten thousand francs! 'tis very dear.'

'It was very dear when you signed your name, but now your services are worth more than that.'

'Alas, it will prevent our marriage!' said the poor girl in a voice choked with tears; and with a despairing heart she left the room.

Two days afterwards, the manager was seated close to the grate in his apartment, trying with all his skill to kindle a fire. All the theatrical attendants were engaged at rehearsal, so he was obliged to dispense with their assistance.

The cashier entered with a visage wofully elongated. The affairs of the theatre were in a critical state; the receipts had diminished; and pay-day at the end of the month approached with a menacing aspect.

'Yes,' said the manager, 'our situation certainly is

embarrassing. And this plaguy fire that wont light! I must call the *souffleur** to help me.'

Astonished that he could jest under the circumstances, the cashier retired. As he was leaving the room, the young actress entered.

'Ah, is it you?' said the manager. 'You are coming from rehearsal!'

'No, sir, I have come to return the part you gave me to study.'

'So it seems you still think of quitting the stage!'

'I have brought you the forfeit.'

'The ten thousand francs?'

'Here they are.'

'And how have you procured this sum?'

'My intended husband gave it me.'

'Is he then so rich?'

'These ten thousand francs are nearly all he possessed. But he said, "What does it signify! we shall only have to defer setting up in business; or perhaps I may succeed in borrowing some money."'

'Going in debt! That's a fine prospect for young housekeepers! So, the dowry you mean to bring your husband is want and ruin; you take from him the hard-earned fruit of his industry, and you oblige him to renounce the prospect of honourable independence.'

'Pray, sir—pray don't speak so cruelly!' sobbed the young girl.

'Have you considered that such a union cannot fail to be unhappy! Listen to reason—take back this money, and return it to him who gave it you. And if you're absolutely resolved to leave the theatre, I'll show you a simple way of doing it, that wont cost you anything. Take this paper, and have the kindness to put it in the grate.'

So saying, he handed her a sheet of paper carefully folded, which she threw among the smouldering sticks.

The manager watched it as the languid flame gradually curled round it, and then shot up in a bright blaze.

'Do you know,' said he, 'what that paper was? It was your signed engagement! And now I have no longer any claim on your services, and consequently can demand no forfeit. Go, my child, marry, employ your little capital well, and be happy.'

Deeply affected by this generous deed, the young actress expressed her gratitude as fervently as her tears permitted.'

'Don't talk to me of gratitude,' replied the manager, 'we are only quits. See, for the last hour I have been blowing in vain at that obstinate fire: you threw your engagement into it, and directly it blazed up. Thanks to me, you are free; and thanks to you, I am giving my hands a good warming!'

DWELLINGS FOR THE HUMBLER CLASSES.

MR. W. A. GUY, in a late lecture on the health of towns (*Journal of Public Health*, No. 4), makes some strong observations on the negligence of owners of houses occupied by the humbler classes in London and elsewhere.

'One of our boasted metropolitan improvements—an apt illustration in itself of the evils of narrow and partial legislation—has left a single street with a few attached courts as a standing reproach to its owners and to the public. These owners, who are persons of wealth and good position in society, are absentees, having probably as little knowledge of, or care for, their property, as if it were at the antipodes; and they sub-let it for a fixed sum to middle-men, who, in their turn, let the houses out in rooms, at exorbitant rents. The tenants of these rooms, true to this wretched system, earn their living, or add to their means, by converting them into low lodging-houses, at a charge of threepence a night, or accommodate whole families of weekly lodgers in the corners or at the sides of the apartments. No one who has not visited this wretched place, and ex-

amined it, as I have done, house by house, and room by room, can form any conception of the depths of degradation to which human beings may be sunk by a vicious system, the offspring of cupidity and negligence. The overcrowding which results from this system, reinforced by the want of water, and the entire absence of the means of decency and comfort, convert every house and room into a focus of disease from which the workhouse infirmary is largely supplied, to the punishment of the ratepayer, whose indifference to his true interest has been one cause of his being thus made to bear the just burdens of other men. Such are the effects of individual and national negligence. The owner of property becomes an absentee, and neglects his duty. Disease and destitution are the inevitable results; and the light burden of prevention which should have been borne by the guilty proprietor, is shifted, as a dead weight of local taxation, to the shoulders of the innocent and unconscionable ratepayer.'

All who are acquainted with our large towns, must admit that the appalling picture here presented is universally applicable—the community is everywhere burdened with rates, and exposed to dangers from the overcrowding of mean dwellings, and the general want of sanitary regulations. A social wrong of this kind ought not to be perpetrated with impunity. The owners of properties should be compelled either to put them in a proper condition, and under proper regulations, as respects health and decency, or abandon them to the public, so as to make way for dwellings of an improved character. We are aware that landlords in too many instances are offered little inducement to improve houses of a humble class, in consequence of the difficulty of getting any rent from tenants in return; and hence the practice of letting such houses to middle-men. But this excuse will not palliate the grievous wrong to which society is exposed: in this, as in other matters, private interest, injuriously exercised, must yield to that of the public. Notwithstanding the alleged valuelessness of much humble property in towns, it is remarkable that there is scarcely a possibility of purchasing it except at an enormous price. Tenements inhabited by paupers, and the constant focus of disease—houses which are almost abandoned by proprietors as worthless—no sooner become an object of request for the sake of public improvement, than prices many times their value are demanded. On a late occasion, we required a site near our printing premises on which to erect dwellings of a respectable order for our workmen. An old half-ruinous house was on the spot required; but though yielding a very trifling rent to its proprietor, and discreditable as respects its internal condition—one of those structures, in short, which ought to be removed as a public nuisance—L.700 was demanded for it; and as this price would have been equal to a ground rent of L.35 annually, the plan of building was given up. Other instances of greed on the part of proprietors in Edinburgh—a greed which invariably defeats itself—could be mentioned: One of the most instructive examples is that of a person asking L.700 for a single floor in an old tenement which produced only L.7 of clear rent annually, the exorbitant demand being made under the impression that a projected improvement could not be executed unless the purchase were made. The improvement, however, has been effected without requiring the old building, which is therefore left standing as a public eyesore, greatly to the sorrow of its too avaricious owner, who would now gladly accept of L.300 for the wretched mass of decayed stone and timber, for which she formerly declined taking less than L.700. It is in no small degree the consequence of this species of cupidity that, private capitalists being prevented from doing anything in the way of renovation, large sections of the town subside into that miserable condition so well depicted by Mr. Guy.

The remedy for this state of affairs appears to be, a law of universal application, which shall give magis-

* In French, *souffleur* signifies both a stage-prompter and a bellows-blower.

trates the power of removing waste, ruinous, and other tenements, injurious to public health, and interruptive of public improvements—in which improvements are to be reckoned the opening up of new thoroughfares, and the erection of dwellings of a proper kind for the labouring classes. By these means the regeneration of towns would be placed on a simple and self-working principle. Private individuals and joint-stock societies would, for their own interest, be found undertaking schemes of improvement publicly beneficial. Instead of being taxed for the making of new streets, communities would be free of all trouble and cost on that account. We do not of course expect that proprietors of old buildings should, by such a scheme, be robbed of their property, vile as it is. Let them be paid a fair equivalent by all means, but no more.

Whether a law of this nature be put in operation or not, it might be possible for the working-classes, by union among themselves, to rent better dwellings at lower rents than those they now generally occupy. All that seems desirable for them to do, is to offer a sufficient guarantee to landlords, and this might be done by a fund previously provided, and currently maintained. By an arrangement with employers—as, for example, leaving a certain sum weekly in their hands, and all becoming conjointly and severally bound to make good deficiencies, a guarantee might also be organised. We have heard of an instance of this nature, by which a large body of men are provided with good houses on what may be called a wholesale principle, the rents not being two-thirds of what they would be if let individually, and without the guarantee we mention.

While on this subject, it may be mentioned that an exceedingly creditable effort has lately been made by a society in London to erect dwellings of an improved kind for the working-classes. We do not allude to the Model Lodging-Houses which have been here and there set on foot, but to a large edifice recently erected by the 'Metropolitan Association for Improving the Dwellings of the Industrious Classes,' in the neighbourhood of the old St Pancras Road. From the Daily News we gather the following particulars of this structure:—It is a building of four storeys, with a long frontage and two wings at right angles, the open space in front being designed as a playground, and the back space as a drying-ground for clothes. The building is on the Scotch plan of including a great number of separate houses under one roof, all reached by common stairs of stone. There are eight entries and staircases, and these give access to houses for one hundred and ten families; some of the dwellings consisting of two, and others of three apartments, but each possessing every accommodation within itself. The aspect of each house is neat and pleasing, and the arrangements for insuring cleanliness and ventilation satisfactory. Houses with two rooms are let for a rent of from 3s. to 5s. per week, according to size; and the sets of three rooms from 4s. 6d. to 7s. per week. These charges include taxes, parish and water rates, and gas in the staircases. 'Even they might have been less, but for the oppressive operation of the window-tax, which exacts, according to the mode of assessment insisted on, the same taxation for ten of these dwellings as that for one forty-windowed house; while each of these sets of rooms would have been exempt from the tax had they been separate cottages.' This exaction we cannot understand; for in Scotland all dwellings on common stairs are legally considered to be distinct houses, and each accordingly pays no window duty if it has fewer than the chargeable number of windows belonging to itself. An appeal to the lords of her Majesty's treasury would surely rectify the mistake here complained of.

Considering the cheapness, the commodiousness, the airiness, and respectability of the dwellings which have been so meritoriously got up by the Association, it might have been expected that they would have been caught at with avidity by the working-men of the neighbour-

hood; but from the account before us, we learn that such has by no means been the case. Much of the dislike to the edifice is perhaps attributable to a prejudice against living on common stairs, as lawyers do at chambers, or as the Scotch, French, and Germans of all classes are in the habit of doing, without any loss of individual independence. Something also is due to an unwillingness to be governed by any sort of regulations. 'A great number of objectors are amateurs of ornithology and zoology; and the moment some of them found they would not be allowed to keep pigs, or pigeons, or fowls, or rabbits, or dogs, they declined inquiring further particulars, and walked away. All this is very lamentable, because it renders the benevolent labours of such associations as the builders of these lodgings, when specifically directed, almost hopeless. The new dwellings, however, are not without tenants; who are indeed of a higher grade than those aimed at by the Association—persons already living in cleanly comfort, though obtained at extravagant prices. The tenants are chiefly artisans of a superior order, such as journeymen pianoforte-makers, composers, and persons who follow chamber trades, such as tailors, flower-makers, chasers, jewellers, &c.; besides clerks, and one or two who possess small independencies. As if to provide an exception on purpose to prove a rule, there is one tenant who belongs to the class for which the building was meant—a gasmaker from the neighbouring works.'

We are told, in conclusion, that 'the labours of the Association for Improving the Dwellings of the Industrious Classes do not end in the Old St Pancras Road. It is their intention to found similar establishments in large manufacturing towns in the provinces; and we trust they will be able to secure another site in the Metropolis, for a building easily accessible to London journeymen. Example placed before the eyes of the inhabitants of squalid neighbourhoods, may in time wean them from the sloughs in which they now choose to exist. If, however, they do not profit by the spectacle of comfort and cleanliness, their children and successors may.'

A PEEP AT MINORCA.

THE following sketch of a chance visit to Mahon—a spot so much out of the beaten track of our English tourists—will not prove uninteresting to our readers, if we may judge from the surprise and pleasure we ourselves experienced, during our twenty-four hours' halt at Minorca, on our voyage to Algeria.

In the beginning of December 18—, I embarked at Toulon in the Montezuma steam frigate, employed to transport from France to Algiers mules, soldiers, and colonists. Three hundred men, four hundred women, and three hundred children, were stowed on the decks of this ship, under the superintendence of the French government. A brilliant sun shone on our departure, a light breeze filled the sails, and before long, the coast of Provence disappeared from our sight.

The sea was calm, the sky serene, the future '*couleur de rose*,' and the deck was crowded with its thousand passengers. Nothing, however, is so treacherous as the Mediterranean; you may feel, as we did, the most perfect security on its tranquil waters, and in a few hours the vessel may pitch and toss in a terrific storm. Such was our case in the present instance. The light breeze which had so gently borne us onward changed to a violent gale, the waters rose, the waves broke against our ship; in short, everything foreboded '*a wild night!*' As if by magic, our decks became deserted, and soon the sighs and moans of the unfortunate sufferers were to be heard on all sides. Englishmen are so well acquainted with the evils of sea-sickness, that I shall only remark, its usual horrors were in this passage tenfold increased by the sight of the four hundred unfortunate women, with their three hundred children, heaped on one another in a space of forty feet by

twenty, through the culpable negligence of the French authorities. Their sufferings during the night were dreadful, especially towards midnight, when the storm became a perfect hurricane. French nature is not rough, even in a seaman; and the delicate attentions of the officers and men to these miserable passengers were unremitting. At length day dawned, but stormy, dark, and gloomy; while the wind and waves seemed to drive us forward towards the coast of Sardinia.

Suddenly the watch cried, 'Land!' 'It must be Minorca,' exclaimed the captain. 'We can now stop at Mahon, our passengers can recruit themselves, and regain their strength, and we can clean out the vessel.' This decision was received with acclamation, and ere long the rocks of Minorca began to rise up before us.

Had it been a hundred times more bare and arid, we should have hailed it as a terrestrial paradise. A cannon from our deck demanded a pilot; and in an instant we saw issuing from the fog, which covered the steep shore of the island, a boat, so small, as to be familiarly termed a 'cockle shell'; it now appeared on the summit of a wave, and then disappeared, as if for ever, in a valley between. Two men steered the tiny craft, which soon approached: a sailor threw a rope; one of them climbed on board; it was the pilot; and in a few moments we perceived a streak of white at the base of the cliff. It was Mahon! or rather the sentinel of Mahon—Fort St Philip.

We steered round an enormous rock, against which the waves dashed with violence—the surge soon subsided; a bay opened: it was the port, and Mahon lay before us.

It is but justice to the Spanish authorities to say, they did not keep us long waiting for permission to land. In a quarter of an hour after casting anchor, we were clambering up the steep rock leading from the harbour to the town.

Mahon is built on a rock, and the port, one of the largest and safest in the Mediterranean, is enclosed within two lines of almost perpendicular cliffs. In the centre, and near the entrance of the harbour, lies a small island, covered with buildings now half in ruins. To this spot the inviolated French soldiers of Algeria resorted for many years, to recruit their strength in the pure air of Minorca, or to make use of it as a resting-place on their passage from Africa to France. But the little island Del Rey is no longer ceded to them for this purpose by the Spanish government; and the French, glad to attribute every annoyance they meet with to the jealousy of the English, allege (with what reason I could not learn) that this refusal is owing to the interference of our foreign office with the cabinet of Spain. 'But,' enthusiastically exclaimed one of my French fellow-travellers, 'what has been the consequence? England ("perfidious Albion") did not foresee the result—Mahon has come to seek France!'

Without doubt the town is now deserted. Its population, formerly amounting to 30,000 souls, at present scarcely numbers 6000. All Mahon is at Algiers, Oran, or Marseilles. The men, clever gardeners, steady and industrious merchants, leave it to make their fortunes at the above-named places; and the young girls, graceful, pretty, and witty, go in quest of husbands: both are eminently successful.

There are two representatives of France at Mahon—one official, the consul; the other officious! the landlord of the Hotel de France. The former, a clever man, is of Dutch extraction, but his family have inhabited Mahon for upwards of a century. His house is a perfect museum of Balearic history, literary and artistic; doubly interesting when examined in the company of its agreeable and well-informed owner. The officious representative, M. Huot, is an old French prisoner of 1809. Brought then to Mahon, he there married, and made his fortune. The houses at Mahon are extremely clean, but our host's hotel surpassed them all. He is most attentive to his guests; and in addition to his other qualifications, is a clever and

most obliging cicerone. Through his means we were enabled, in twenty-four hours, to visit every curiosity of the town. Besides, the Mahonese (or I should say the Mahonese ladies) are so very courteous, that every door is open to a stranger, provided his manners and appearance be that of a gentleman. . . . 'Senor, let us speak of France—let us speak of Paris!' were the first words that greeted us on entering. On my remarking this to my French friend, he replied, with the usual vanity of his nation, 'Ah! mon ami, Paris is the Mecca of all the civilised women in the world!' Not being prepared to prove the contrary, I prudently refrained from pursuing the subject, especially as the Mahonese ladies to whom we spoke seemed to regard it as the 'tomb of their prophet.' Several had made their pilgrimage thither; and their graceful appearance, dress, and engaging manners, bore ample evidence to my companion of the advantages they had derived.

Mahon boasts the manufacture of those flowers in enamel so much prized for ornaments in Paris. Nothing is more attractive or coquettish than the workshops of these flower-makers. There, alone, are to be seen no *jalouses*, or blinds, those stupid jailors of Spanish houses. The *atelier* is on the ground-floor; and while passing in the street, you see twelve or fifteen young girls, all pretty (there is not an ugly woman in Mahon), cease their work, and fix their large eyes on the prying stranger who stops to observe them. As a matter of course, the owner of the establishment invites you to enter and examine her collection of flowers. Who could refuse such an invitation? A selection is soon made, and the purchase concluded; and he who only entered through curiosity, still lingers to answer the numerous questions which are addressed to him in the most fascinating manner, and he departs in admiration of the grace and wit of his fair interlocutors.

The gravity of the Spanish authorities forms a striking contrast to the charming vivacity of this gay people. Inasmuch as the Mahonese love conversation and intellectual society, so are the Spaniards of Mahon morose and melancholy. Their character does not sympathise with that of the inhabitants, who take every occasion to draw the distinction of, 'I am not a Spaniard, I am a Mahonese!'

Mahon contains no public buildings, with the exception of three or four churches, of very doubtful architecture, and still more equivocal ornaments, in which the enamel flowers, as may be supposed, figure conspicuously. In the cathedral are a few monuments of carved wood, gilt, which at first sight make a brilliant effect, though the taste is not of the purest. The organs are the objects most worthy of admiration in the churches. That in the cathedral was made by a German, and the tones are as sweet and full as any I ever heard. A young 'Maestro di Cappella' performed for us on this magnificent instrument for nearly an hour. He was a clever musician, and played twenty different pieces, from a sonata of Bach to the modern airs of Rossini, Auber, and Verdi. During this concert, given for our benefit, the nave of the church became crowded with listeners, and their joyous countenances proved how well they valued the talents of their young organist.

After the church, the cemetery is most worthy of remark. The Campo Santo, or burial-ground of Mahon, is a large yard encircled by high walls, and in which are as many entrances to mortuary chapels as the space permits. The names and rank of the deceased are recorded on a tablet over an altar, and the body lies in a vault underneath. The graveyard itself is nothing but an avenue divided into as many compartments as there are tombs; a horizontal slab contains the style and title of their inmates. The walls, in general, are painted black and blue, which gives them a fantastic appearance.

Nothing looks more melancholy than the gardens in the environs of Mahon. The gardeners, valued for their talents in other countries, have surrounded with heaps of pebbles the squares of cultivated earth which they have created for themselves on the barren rock, whereon

stands the town. They have carried this earth up from the valley in the same way they carried up the pebbles, which prevent its being swept off by the annual torrents of rain. Imagine a country cut into squares like a chess-board by heaps of pebbles, and without the shade of a single tree! On this arid soil grow the vines of Mahon.

Mahon possesses a theatre supplied alternately by Spanish and Italian artistes. The latter enjoyed undivided sway at the time of our visit, and we availed ourselves of the leisure granted us by the storm to hear the 'Elisir d'Amore.' Certainly the singers were far from being first-rate. Their voices were worn, and their instruction incomplete; yet the opera, as a whole, was better performed than in many of the provincial towns of the continent. It must be said, to the honour of the Mahonese, that they possess great musical taste. Far from being indifferent, they applaud every good effect, or well-executed passage. This love of music seems born with them; and the orchestra, which is excellent, is composed of amateurs of the town, who perform like true artists. The interior of the theatre is of a good size, and makes a pretty effect. The first, second, and third rows are divided into boxes, and a considerable portion of the pit is occupied by the orchestra. The Mahonese ladies appear there in full dress. Nearly all wear the mantilla or national veil, fastened coquettishly on their hair, and the fan plays in their hands the same graceful and malicious part which I believed alone to be the secret of the Spanish ladies.

Such is Mahon; and by what it now is, in its abandonment and poverty, we may judge of what it was in the days of its greatness. Of this grandeur of the past, nothing now remains but a vague reminiscence. And, alas! we are told that all this varnish of politeness, this elegance of manners, covers many a moral wound, and a vast deal of misery. Fortunately, we had no time to dispel our illusions by convincing ourselves of this fact. The morning after our arrival at Mahon, a cannon-shot recalled us to our ship. At one o'clock that afternoon we cast a farewell glance at this town, once so flourishing, at this hospitable port, which nature has formed in the centre of the Mediterranean; and, our last look resting on the little island Del Rey, the rugged shores of Minorca vanished from our view.

The following morning, about nine o'clock, I beheld rising before my enchanted sight the rich verdure of the Sahel of Algiers, and the white houses of this capital of French Africa.

TOWN LYRICS.*

We do not know that the term 'minor poetry' is justly applicable to such pieces as these, many of which rank with the highest of their class. They are at least major in their own circle; and that circle, though comparatively humble in point of genius, is far wider in extent, more general in influence, and therefore more important in its bearings upon the public mind, than the one which comprises only the higher and more complicated works of art.

There is one point in respect to which we are inclined to place Charles Mackay at the head of the fugitive or occasional poets of the day; and that is—the suggestive character of his verses. Mrs Hemans, and most of the writers who followed, or walked side by side with her, exhaust the subject they illustrate. There is a neatness and completeness in their pieces which leave the mind of the reader in a state of tranquil satisfaction. Charles Mackay, on the other hand, not only stirs up our thoughts like these, but leaves them in the midst of the turbulence. He makes poets of us all for the time; and when we have come to the end of his verses, our glazed eye rests without speculation upon the page, and we continue in our own

mind the series of images he has suggested. Let any one read the 'Light in the Window,' for instance, and he will comprehend what we mean; or let him read here 'Above and Below,' which is only one of the numerous examples we could give, from this cheap and neat little volume, of the suggestive lyrics:

ABOVE AND BELOW.

Mighty river, oh! mighty river,
Rolling in ebb and flow for ever
Through the city so vast and old;
Through massive bridges—by domes and spires,
Crowned with the smoke of a myriad fires:
City of majesty, power, and gold;
Thou lovest to float on thy waters dull
The white-winged fleets so beautiful,
And the lordly steamers speeding along,
Wind-defying, and swift and strong;
Thou bearest them all on thy motherly breast,
Laden with riches, at trade's behest—
Bounteous trade, whose wine and corn
Stock the garner and fill the horn,
Who gives us luxury, joy, and pleasure,
Stintless, sumless, out of measure—
Thou art a rich and a mighty river,
Rolling in ebb and flow for ever.

Doleful river, oh! doleful river,
Pale on thy breast the moonbeams quiver,
Through the city so drear and cold—
City of sorrows hard to bear,
Of guilt, injustice, and despair—
City of miseries untold;
Thou hidest below, in thy treacherous waters,
The death-cold forms of Beauty's daughters;
The corpses pale of the young and sad—
Of the old whom sorrow has goaded mad—
Mothers of babes that cannot know
The sires that left them to their wo—
Women forlorn, and men that run
The race of passion, and die undone;
Thou takest them all in thy careless wave,
Thou givest them all a ready grave;
Thou art a black and a doleful river,
Rolling in ebb and flow for ever.

In ebb and flow for ever and ever—
So rolls the world, thou murky river,
So rolls the tide, above and below:
Above, the rower impels his boat;
Below, with the current the dead men float:
The waves may smile in the sunny glow,
While above, in the glitter, and pomp, and glare,
The flags of the vessels flap the air;
But below, in the silent under-tide,
The waters vomit the wretch that died:
Above, the sound of the music swells,
From the passing ship, from the city bells;
From below there cometh a gurgling breath,
As the desperate diver yields to death:
Above and below the waters go,
Bearing their burden of joy or wo;
Rolling along, thou mighty river,
In ebb and flow for ever and ever.

A LATE CONTRIBUTION TO THE BANNATYNE CLUB.

THE Duke of Sutherland has made an interesting contribution to the works of the Bannatyne Club. It is a thin quarto volume, containing two ancient records of the bishopric of Caithness, procured from the charter-room at Dunrobin. To the records are attached a few preliminary pages descriptive of the early history of Caithness, of which the county of Sutherland once formed a part. The period referred to is the twelfth and thirteenth centuries, when this extreme northern part of the island of Great Britain owned a divided allegiance to the kings of Scotland and Norway—the power of the former latterly predominating, partly from the influence of the church. Some parts of this curious work present a graphic picture of the rudeness of ancient manners.

Earl Harald, for the redemption of his sins, had granted to the church a penny yearly from each inhabited house in the earldom of Caithness, and this revenue was levied by Andrew, the first bishop of the diocese, till his decease in 1185. The next bishop was John, who, it appears, declined to exact the contribution; 'but the Pope (Innocent III.) summoned him to obedience, and even granted a commission to the bishops of Orkney and Rosmarky to compel him to levy the tax, by the heavy censures of the church.

* Town Lyrics, and other Poems. By Charles Mackay, LL.D. Author of 'Voices from the Crowd,' &c. London: Bogue.

Whether the poor bishop complied, or attempted to enforce the exaction of the tax, we are not informed; but his subsequent fate, as narrated in the wild sagas of the Norsemen, might appear incredible, were it not singularly corroborated by a Roman record. Earl Harald Mǫðadson, who had been deprived of his Caithness possessions by William the Lion [king of Scotland], resolved to recover them by force, and crossed from his Orkney kingdom to Thurso with a great fleet. There was no force capable of resistance. The bishop, who was residing in his palace of Skrabister, went out to meet him, as the intercessor for the poor Caithness men; but the savage earl took him and cut out his tongue, and dug out his eyes with a knife. The saga goes on to tell us that Bishop John recovered the use of his tongue and his eyes, by the miraculous intervention of a native saint, written Tröllhæna.

The latter part of the story is not confirmed by any good authority; but some part of the barbarity of the earl, and the bishop's sufferings, is confirmed by the following letter of Pope Innocent, ascribed to the year 1202, addressed to the bishop of the Orkneys:—"We have learnt by your letters that Lombard, a layman, the bearer of these presents, accompanied his earl on an expedition into Caithness; that there the earl's army stormed a castle, killed almost all who were in it, and took prisoner the bishop of Caithness; and that this Lombard (as he says) was compelled, by some of the earl's soldiery, to cut out the bishop's tongue. Now, because the sin is great and grievous, in absolving him according to the form of the church, we have prescribed this penance for satisfaction of his offence, and to the terror of others—That he shall hasten home, and barefooted, and naked except treads and a short woollen vest without sleeves, having his tongue tied by a string, and drawn out so as to project beyond his lips, and the ends of the string bound round his neck, with rods in his hand, in sight of all men, walk for fifteen days successively through his own native district [the district of the mutilated bishop] and the neighbouring country; he shall go to the door of the church without entering, and there, prostrate on the earth, undergo discipline with the rods he is to carry; he is thus to spend each day in silence and fasting, until evening, when he shall support nature with bread and water only. After these fifteen days are passed, he shall prepare within a month to set out for Jerusalem, and there labour in the service of the Cross for three years; he shall never more bear arms against Christians; for two years he shall fast every Friday on bread and water, unless, by the indulgence of some discreet bishop, or on account of bodily infirmity, this abstinence be mitigated. Do you then receive him returning in this manner, and see that he observe the penance enjoined him."

William the Lyon did not fail to exact the penalty of such an outrage. In 1197, he collected a mighty army, crossed the Oikel, and, perhaps for the first time, entirely subdued and intimidated the provinces of Caithness and Sutherland. As usual, the blow fell upon the people. The guilty chief made terms, and left his Caithness subjects to pay the enormous fine of a fourth of their whole possessions.

Such is a picture of the state of ancient Scotland, before the blended light of Christianity and civilisation had softened the natural asperities of society. The important service rendered by the Bannatyne Club, in making such documents as the Caithness Charters accessible to the historian, need not be expatiated on.

HAZLITT'S ADVICE TO HIS SON.

Do not begin to quarrel with the world too soon; for bad as it may be, it is the best we have to live in here. If railing would have made it better, it would have been reformed long ago; but as this is not to be hoped for at present, the best way to slide through it is as contentedly and innocently as we may. The worst fault it has is *want of charity*; and calling knave or fool at every turn will not cure this failing. Consider as a matter of vanity, that if there were not so many knaves and fools as we find, the wise and honest would not be those rare and shining characters that they are allowed to be; and, as a matter of philosophy, that if the world be really incorrigible in this respect, it is a reflection to make one sad, and not angry. We may laugh or weep at the madness of mankind, we have no right to vilify them for our own sake or theirs. Misanthropy is not the disgust of the mind at human

nature, but with itself; for it is laying its own exaggerated vices as foul, blots at the door of others! Do not, however, mistake what I have here said. I would not have you, when you grow up, adopt the low and sordid fashion of palliating existing abuses, of putting the best face upon the worst things. I only mean that indiscriminate, unqualified satire can do little good; and those who indulge in the most revolting speculations of human nature, do not themselves always set the fairest examples, or strive to prevent its lower degradation.

THE LAW'S ENCOURAGEMENT OF QUACKERY.

A case before the Master of the Rolls curiously illustrates the deficient state of medical law in this country. A chemist—who, like all other chemists or persons in this kingdom, is allowed to concoct whatever poisons they please for the cure of diseases, and to sell them, provided they pay for a government stamp—puts together certain ingredients in the form of pills. He calls these consumptive pills; and in order to insure more extensive notice and sale, he uses the name of Sir James Clark, who is well known for the attention he has paid to the study of consumption, and issues advertisements calling his pills 'Sir James Clark's Consumptive Pills,' thus leading the public to suppose that the pills were made from a prescription of this gentleman. He goes even further than this, and gulls the public into the belief that special favour had been shown to him in this instance; and says in his advertisement, 'By her Majesty's permission.' Now if this man were dispensing some harmless sweetmeat, or some form of farinaceous food, Sir James Clark needed not perhaps to have complained; but from an examination of the pills, it appears that antimony and mercury were contained in them, which are known to be specially injurious in some forms of the diseases in which they are recommended by the advertiser. Of this use of his name, then, we think that Sir James Clark has a perfect right to complain; and against such a use of it, in the name of justice, every honest man must protest. The public purchase these pills on the faith of the advertisement, as the result of Sir James Clark's experience in the diseases for which they are sold; and on finding themselves made worse by them, they would have their confidence diminished in the skill of the supposed subscriber. He is therefore directly injured by the sale of these pills. Yet the law of the country has no resource for him, and he is told by the Master of the Rolls that 'it was one of the taxes imposed on eminent men to have their names thus made use of.'—*Daily News*, Feb. 4. [If this be the law of England, no man of any note is safe from aggression; we trust, however, that the subject will not be suffered to rest where the Master of the Rolls seems disposed to leave it.]

MUSCULAR EXERCISE.

Muscular exercise is a direct source of pleasure to every one not suffering from diseased action. Every one must have felt this. The effect of using the muscles of voluntary motion, when all the processes of the economy are being justly and healthily performed, is to impart a marked and grateful stimulus to the sentient nerves of the part, and a corresponding and grateful stimulus to the nervous system generally, sufficiently noticeable by the mind when studious of its analysis, and always ministering indirectly to the happiness of the individual, colouring and brightening the thoughts and feelings. So much is this believed to be the case by some, that it has been asserted—a man may use his limbs too much to leave him in the enjoyment of his fullest capability of pure and abstract thought, and to the extent of making him unduly imaginative. Although this may well be matter of doubt, the fact, and its wise and benevolent intention, remain unaffected: that man derives an immediate pleasurable sensation from using his voluntary muscles, which not only gives to labour a zest, and even to monotonous movements some degree of enjoyment, but produces a reaction on the mind itself, embellishing a life of virtuous toil with a degree of physical enjoyment, and mental energy, buoyancy, and hopeful light-heartedness, that can never be afforded in a like degree to the drones—the mere 'fruges consumere nati'—of the human hive.—*Robertson on Diet and Regimen*.

TRAVELLERS' TALES.

A PROVERB setting forth the small amount of credence due to the reports of travellers, has been found in nearly every country among the dictates of its popular wisdom. The Esquimaux of Baffin's Bay applied it to their countryman when, on his return from a voyage to Aberdeen in one of the Greenland whalers, he informed them that in the far south he had seen 'sledges with feet like the full moon, drawn by creatures larger than four of their dogs together; herds of animals of the size of the white bear, with horns like that of the narwhal; and tall pillars growing out of the earth, with green heads spreading wide as the summer tents of his tribe.'

'Allah, show mercy to the tongues of travellers!' exclaimed a Bedouin, when a Greek interpreter at Grand Cairo told him that in Christian lands he had seen men make fires of black stones, and burn smoke in their lamps instead of oil. Soon after the arrival of the Portuguese in India, a native of Goa, who had journeyed as far as the Himalaya, told a priest of Buddha that he had seen 'hard water' at the source of the Brahmapootra, and wished to bring some specimens with him, but they melted away in his basket. 'Attempt not to deceive a servant of the gods!' said the priest: 'I have read the books of Buddha, and know all things. The rain descends from the clouds, and the streams run to the sea for ever: water cannot change into stone.' And when the man attested the truth of his statement, the priest's palanquin bearers fell upon him with their bamboos.

Examples of a similar kind might be met with nearer home. We remember one of an old dame residing in a small village on the east coast of Scotland. Her only son had become a sailor on board a vessel engaged in the Greenland whale fishery, and just returned from the northern seas. The event occasioned a kind of assembly at his mother's cottage; old neighbours sat round; and he, as the hero of the evening, related his adventures. All went on well, and the company wondered in silence, till the young man told how the sun had shone on the whaler's track for six weeks without setting, and they had killed a great seal off the coast of Spitzbergen larger than a dray-horse, with tusks twelve inches long, when the mother groaned out, 'Jock, Jock, whar did ye learn to lee? Can ye no tell us something that's Christian like, if it was only about a mermaid?'

The origin of a prejudice so widely diffused, must appear inexplicable to those unacquainted with the accounts which early European travellers, in times when commerce was less extensive, and navigation less understood, brought back from the unknown regions into which they chanced to penetrate. Strange and inco-

herent were those fables—sometimes arising out of distorted veins of existing facts, sometimes originating in ignorance of the language of the natives, and occasionally in the mind of the traveller, deeply imbued with the superstition of his age, and therefore unequal to the task of investigating the reports of popular credulity, or the motives of men interested in their propagation. The works of Greek and Roman authors that have come down to us, and remain, after the lapse of so many centuries, the most certain memorials, and the only intelligible records, of that long abolished state of things which scholars call the classic world, are filled with such marvellous fictions. Most of them are indeed found in the pages of the poets, and generally charged to their account; but it is apparent that these gentlemen only enlarged on beliefs already current among their countrymen, and statements which, however ridiculous they may seem to our better-instructed times, were then implicitly believed by both philosopher and student as part and parcel of the knowledge of their age.

The centre of India was said to be occupied by a people who came to their maturity at five years old, and died of age at twenty. The peninsula of Malacca was spoken of as the golden Chersonesus, whose stones were gems, and whose very dust was heavy with grains of gold. The country of the Simoides in Northern Siberia, then part of the greater Scythia, was assigned as the residence of a race with dogs' heads, who barked out their words in true canine fashion; and the Cimmerian Bosphorus, the place of perpetual darkness and all manner of monsters, was fixed between the Black and Caspian Seas, now one of the finest portions of the vast empire of Russia. But it was on Africa that the travellers of the classic times delighted to expatiate. Its western mountains, under the denomination of Atlas, which they still retain, were popularly believed to support the sky. At their foot were situated the gardens of the Hesperides, the trees of which bore golden fruit, and were guarded by dragons breathing flame. The region now forms part of the new French province of Algeria; and unless we include the Gallic colonists, and the marauding Arabs, neither dragon nor Hesperide is to be seen.

The eastern division of the continent—comprehending Upper and Lower Abyssinia, with which the travels of Bruce, and subsequently those of Major Harris, have now made the reading public tolerably acquainted—was then the country of the Blemmyes—a race of men without heads, having their faces in their breasts; and of the long-lived Ethiopians, a pastoral people who roved over great plains near the equator, possessing nothing but their tents and herds of cattle, subsisting exclusively on flesh and milk, and never dying earlier than the age of one hundred and twenty years. Farther still to the south was the land of the Pigmies, a dwarfish

race, whose tallest men never rose above an English foot, and whose greatest enemies were the cranes.

Nor will the abundance of such errors appear surprising, when it is considered how large a portion of the habitable earth was *terra incognita*, or unknown land, to the famous Greeks and conquering Romans. When Alexander wept for another world in which to try his prowess, his whole geographical knowledge was confined to the south of Europe, the south-west of Asia, and the northern coast of Africa, from Egypt to Tunis, which every schoolboy knows scarcely comprehends one-fifth of the peopled world. The countries that have become greatest and most distinguished in European history were unknown to Alexander. Of the greater part of France, the whole of Austria, Prussia, Denmark, Sweden, and Russia, he knew nothing, and never dreamt of Britain, whose ships now bear her commerce to regions that never heard his name, whose authority extends over the vast region of Hindostan, the western frontier of which his legions thought it such an exploit even to approach; and it is remarkable that there is at this moment in the British Museum an empty urn, traditionally said to have contained the ashes of the great Macedonian, which came into the possession of the English troops on the capitulation of Alexandria in 1802, and was presented by George III. to that institution.

At the commencement of the Christian era, in the reign of Augustus, under whose sway Rome was believed to have attained to the zenith of her splendour in power, in arts, and in literature, the Orkneys were called Ultima Thule, the most northern land known; Cape Roca Sintra, on the west of Portugal, was styled the boundary of earth, and sea, and sky, beyond which mortal ken had never penetrated; the whole north-east of Asia in Europe was denominated the trackless Scythia; and there was a dim traditional idea that India extended southward a great but indefinite distance, and was bounded to the eastward by the far Cathay, as the ancients called China, whose frontier no traveller had ever reached, and whose gods and people were unknown to the rest of the world.

It would seem strange that nations so far advanced in civilisation as the Greeks and Romans undoubtedly were, should have been so ignorant of practical geography, if we were not aware that, notwithstanding their boasted superiority in the arts of painting, sculpture, and architecture, not to speak of many branches of literature, they were miserably deficient in both the theory and practice of navigation. Jason's expedition to Colchis, which furnished a theme for wonder and fable to half the poets of antiquity, was a voyage from the north of Greece to western Georgia, scarcely as far as from London to St Petersburg, and less than a week's sail even to a Russian vessel of the present day. In the Roman times, little speed had been attained. It was no unusual circumstance for vessels bound from Syria to Italy to winter in the port of Crete, now Candia; and from a chapter in the Acts of the Apostles, describing St Paul's voyage in this direction in the reign of the Emperor Nero, we find that it occupied several months to travel a distance which a modern steamer could accomplish in a few days.

About a century before, when Julius Cæsar first attempted to conduct the army with which he conquered Gaul, now France and Belgium, into Britain, they absolutely refused to follow him, saying it was beyond the bounds of the habitable earth. A philosopher of that very country, which seemed so isolated and barbarous to the Romans, the celebrated Dr Thomas Browne, in his work on 'Vulgar Errors,' published in the middle of the seventeenth century, has recorded the following curious specimen of their geographical accuracy:—

'The other relation of loadstone mines and rocks in the shore of India is delivered of old by Pliny; wherein, saith he, they are placed both in abundance and vigour, that it proves an adventure of hazard to pass those coasts in a ship with iron nails. Serapion

the Moor, an author of good esteem and reasonable antiquity, confirmeth the same, whose expression in the word *magnet* is this: The mine of this stone is in the sea coast of India; whereto, when ships approach, there is no iron in them which flies not like a bird into the mountains; and therefore their ships are fastened not with iron, but wood, for otherwise they would be torn to pieces.' And the learned author judiciously adds, 'But this assertion, how positive soever, is contradicted by all navigators that pass that way; which are now many, and of our own nation, and might surely have been controuled by Nearchus, the admiral of Alexander, who, not knowing the compass, was fain to coast that shore.'

During that period which elapsed between the destruction of the Roman Empire and the revival of European learning, known in history as the Gothic ages, geographical knowledge, as well as arts and commerce, were crushed into still narrower limits by the general barbarism and confusion of the times; hence fabulous wonders of all kinds were multiplied, and occupy a conspicuous place in the scanty literature which wandering minstrel or recording monk has chronicled. The whole of Asia, then possessed by the Saracens or Mohammedan Tartars, as far as palmer or pilgrim had penetrated, was celebrated for dragons, griffins, and giants; besides which, in Tartary, there was believed to exist a passage of direct communication with the infernal regions, popular superstition having confounded the name of the country with the old Latin term Tartarus. The north of Denmark and Sweden was the reputed country of ogres—savage giants who dwelt in rock-built castles, and subsisted by cannibalism; Lapland was regarded as the grand warehouse of witchcraft; and the loadstone, probably owing to its wonderful magnetic qualities, made a still greater figure in the geography of the middle ages than it had done in the days of Pliny: huge mountains of this substance were believed to form the northern boundary of the world, by which, when the mariner's compass was discovered in the fourteenth century, the scholars of the age accounted for the magnetic needle continually pointing in that direction.

Yet while such reports were generally believed by the populace, and gravely recorded by the learned, the spirit of the old woman's rebuke to her son, which we have quoted, seems to have influenced the countrymen of Marco Polo, a Venetian traveller, who, towards the close of the thirteenth century, traversed Eastern Tartary and the northern part of China, and returned to tell of the great cities, immense wealth, and overwhelming population he had seen in those hitherto untravelled lands. His accounts, however, were considered so incredible, that the Venetians gave him the sobriquet of 'Millioni,' from the frequent recurrence of millions in his statements, which, allowing for the difference of time, and the effects of conquest, modern discovery has proved to be remarkably correct. But even in times much nearer our own than the middle ages, it is curious to look back on the fables of a similar kind, which were in some degree entertained even by the learned. Long after its conquest by the Spaniards, the centre of South America was supposed to be the El Dorado, or land of gold, where the precious metal might be literally gathered like dust.

When James I. issued his celebrated publication against witchcraft, among the earliest prosecutions for the peculiar crime on which the monarch so profoundly enlarged, is one case known in the parlance of those days as 'The great mystery of Thammes Streette,' which strikingly illustrates at once the terrors and mistakes of the time. It is that of a woman who is indicted for having in her possession 'ane magical vessel to work sorcerie withall, the like whereoff was never seen in Christendom, but had been brought to her by her wicked son in one of the Companie's shippes from the Isles of Spice, whar he gat it from certain Chineses.'

It is satisfactory to know that the unlucky dame

escaped the doom of those who dealt in magic, not being even made to swim for her life, the article in question having turned out, on minute investigation, to be nothing more than a china teapot, and the first of the kind ever seen in England. The account sounds strangely now when read beside one of the countless tea-tables of Britain. But regarding china-ware, some singular tales were afloat in still later times. A learned physician, towards the end of the Commonwealth, remarks, 'We are not thoroughly resolved concerning porcelaine or china dishes, that, according to common belief, they are made of earth which lyeth in preparation about an hundred years under ground, for the relations thereof are not only divers, but contrary, and authors agree not herein. Guido Pancirollus will have them made of egg-shells, lobster-shells, and gypsum, laid up in the earth the space of eighty years. Of the same, affirmation is made by Scaliger, and the common opinion of most. Ramuzius, in his Navigations, is of a contrary assertion—that they are made out of earth, not laid up in the earth, but hardened in the sun and wind the space of forty years.' In addition to this, the doctor observes, 'and of those surely the properties must be verified, which, by Scaliger and others, are ascribed to china dishes, that they admit no poison, that they strike fire, that they will grow hot no higher than the liquor in them ariseth. For such as pass amongst us, and under the name of the finest, will only strike fire, but not discover aconite, mercury, or arsenic, but may be useful in dysenteries and fluxes beyond others.'

Such were the powers accorded to porcelain by the medical profession under Cromwell's sway; but so late as the close of the seventeenth century, we find a letter addressed by the Royal Society of London to Sir Philbert Vernatti, resident in Batavia in Java, filled with questions regarding that part of the globe and its productions, propounded in evident earnestness and gravity. A specimen of these, together with the resident's answers, we present to our readers:—

Question.—Whether diamonds, and other precious stones, grow again, after three or four years, in the same places where they have been digged out?

Answer.—Never, or at least as long as the memory of man can attain to.

Q.—Whether there be a hill in Sumatra which burneth continually, and a fountain which runneth pure balsam?

A.—There is a hill that burneth in Sumatra, near Endrapoer; but I cannot hear of any such fountain; and I believe that the like hill is upon Java Major, opposite to Batavia: for in a clear morning or evening, from the road, a man may perfectly perceive a continual smoke rise from the top, and vanish by little and little. I have often felt earthquakes here, but they do not continue long. In the year 1656 or 1657, I do not remember well the time, Batavia was covered in one afternoon, about two of the clock, with a black dust, which, being gathered together, was so ponderous, that it exceeded the weight in gold. I at that time being very ill, did not take much notice of it; but some have gathered it, and if I light upon it, shall send you some. It is here thought it came out of the hill: I never heard of any that had been upon this hill's top. Endrapoer is counted a mighty unwholesome place, as likewise all others where pepper grows, as Jamby Banjar, though some impute it to the hills burning. As for the fountain, it is unknown to us, except *Oleum Terrae* is meant by it, which is to be had in Sumatra; but the best comes from Pegu.

Q.—Whether, in the island of Sombro, which lieth northwards of Sumatra, about eight degrees northern latitude, there be found such a vegetable as Master James Lancaster relates to have seen, which grows up to a tree, shrinks down when one offers to pluck it up into the ground, and would quite shrink unless held very tight? And whether the same, being forcibly plucked up, hath a worm for its root, diminishing more and more according as the tree groweth in greatness; and as soon as the worm is wholly turned into the tree,

rooting in the ground, and so growing great? And whether the same, plucked up young, turns by the time it is dry into a hard stone, much like to white coral?

A.—I cannot tell: I met not with any that ever have heard of such a vegetable.

Q.—Whether the Indians can so prepare that stupefying herb *datura*, that they make it to lie several days, months, years, according as they will have it, in a man's body, without doing him any hurt, and at the end kill him, without missing half an hour's time?

A.—The China men in this place have formerly used *datura* as a fermentation to a sort of drink, much beloved by the soldiers and mariners, called *luzherbier*, which makes them raging mad, so that it is forbidden, under the penalty of great pain, to make use of the same.

Q.—Whether the animal called *abados*, or *rhinoceros*, hath teeth, claws, flesh, blood, and skin, as well as his horns antidotal?

A.—Their horns, teeth, claws, and blood are esteemed antidotes, and have the same use in the Indian pharmacopoeia as *thereica* hath in ours.

Q.—If the best ambergrease be found in the islands of Socotora and Aniana, near Java, to endeavour the getting of more certain knowledge, what of its being reported to be bred at the bottom of the sea, like to a thick mud?

A.—The best that is in the world comes from the island Mauritius, and it is commonly found after a storm. The hogs can smell it at a great distance, who run like mad to it, and devour it commonly before the people come to it. It is held to be a riscosity, which, being dried by the sun, turns to such a consistence as is daily seen. Myraine's father, Isaac Zigny, a Frenchman in Oleron, hath been a great traveller in his time, and he told me he sailed once in his youth through so many of these zequalen as would have loaded ten ships. The like having been never seen, his curiosity did drive him to take up some of those, which, being dried in the sun, were perceived to be the best ambergrease in the world. I have seen one piece which he kept as a memento, and another piece he sold for £1300 sterling. This being discovered, they set sail to the same place where these appeared, and cruising there to and fro for the space of six weeks, but could not perceive any more. Where this place is situated I do not know; but Monsieur Gentillot, a French captain in Holland, can tell you.

Here is an evidence of the amount of information possessed by some of the greatest scholars in Britain, about the period of the Revolution, concerning countries now filled with British commerce, and for the greater part governed by British authority. A man of ordinary education in the present day would smile at the idea of a fountain running pure balsam, and a tree with a worm for its root, which changed into white coral, not to speak of the medicinal claws of the rhinoceros. But when the slowness and difficulty of communication in former ages are considered, together with the barriers of prejudice and hostility which rose between the nations, restricting commerce, and paralysing research, we will no longer wonder that ignorance, and consequent error, on these, as well as on more important subjects, should have been so prevalent.

In our own age, these barriers are considerably broken down by the freedom and extension of commerce, the inquiries of experimental science, and, above all, the general diffusion of instruction, by which more enlightened ideas are communicated to the people, and a more liberal policy prevails among the rulers of every civilised nation. A remarkable example of the contrary state of things existing at the period in which he lived, is given us in the answer of the above-mentioned resident of Batavia to the Royal Society's inquiry whether or not the celebrated birds'-nests, regarded as such delicacies by the Chinese, might be imported into Britain. Be it observed, the Company to which he refers was composed of Dutch merchants, supported by the authority of their government.

'If the question be made—Whether these things may be brought over by permission of the Company? I answer as first, that their laws forbid the transportation of all whatsoever, whether necessary to the conservation of health, or acquisition of wealth, or rarities; and if the querie be concerning the nature and substance of the wood and nests, they are transportable, and can subsist, without decaying, many years.'

Thus did the narrow-minded selfishness of every people in turn impede the investigations of philosophy, and retard the improvement of mankind. It is remarkable, after all, that many an early fable, once believed in the full breadth of its wonder, has been discovered, in later times, to have had its foundation in greatly exaggerated or misrepresented truth. The Blemmyes of the ancients are explained as a savage people of Eastern Nubia, whose short necks and large heads suggested to some early and ill-informed traveller the extraordinary conformation ascribed to them; while the flat faces, coarse features, and guttural tones of the northern Siberians, endowed them with dogs' heads, in the imagination of Southern Europe, for many an age. The ogres of the north were but a distorted and traditional remembrance of the ferocious Sea-kings, or leaders of those piratical bands who issued from the Baltic, carrying ruin and devastation to every coast of Europe, from England to Greece, in the ninth and tenth centuries. In like manner the long tenacious fibres of some Javanese plant or shrub may have given rise to the idea of a living root; and when we take into account the proneness to exaggeration, and love of the marvellous, common to mankind in every climate, similar misrepresentations will be easily explained. They serve, however, to illustrate the power and progress of knowledge, and stand forth as points of comparison between our age and the past, over which we have a manifest advantage. But as the march of discovery is still proceeding with increased velocity, it is difficult to say how much of our own generation's practical wisdom and speculative opinions may be regarded by our successors only as Travellers' Tales.

ARTIFICIAL MARBLE.

We have lately been much interested by an examination of specimens of artificial marble, sandstone, conglomerate, and other mineral productions made by a lady.*

Curious and useful discoveries may be arranged in three classes: first, those which are the result of mere accident, and therefore reflect no honour on those by whom they are made; and second, those made by a new application of known principles or facts, reflecting on the discoverer all the honour due to superior acuteness of mind, and a fine perception of the connection between cause and effect; the third and highest class are those resulting from a preconceived idea, wrought out to demonstration by pure force of reasoning and experiment, which is, in fact, just tangible reasoning.

To this last class belongs the discovery we are about to notice. So far back as 1840, Mrs Marshall was struck with the odd idea, that the animal and vegetable remains so universally found in the secondary and tertiary strata might, by a chemical or electric influence exerted upon the disintegrated particles of these rocks, have been the cause of their aggregation.

Between the first rude outline of this idea and the realisation of Mrs Marshall's wishes, five years, and upwards of ten thousand experiments, intervened. Many of these were forbidden in their detail, and others requiring truly scientific patience to complete; but the whole result has been a satisfactory demonstration that if the constituents of any mineral body of which lime forms a part be mixed in their true proportions (the lime used being free from carbon in any form), and these mixed

with animal and vegetable remains, under circumstances of due moisture and heat, aggregation of their particles will take place at periods varying with the substances under experiment, from a few minutes, to hours, weeks, and months; and these artificial aggregations (allowing for absence of time, and the incalculable amount of superincumbent pressure present in the natural phenomena) come so undeniably near, in appearance and qualities, to the products of nature, as to throw a totally new and interesting light on some of her hitherto most mysterious operations.*

There are two problems which have justly been considered by geologists as among the most difficult in their science: The one is, that the nodules in strata containing fossils, particularly crustaceous relics, contain more lime—taking size for size—than the intervening spaces in the beds. The natural conclusion at first sight is, that the surplus lime accrues from the osseous fabric of the organism. But investigation proves that there is more lime contained in the whole nodule than this will account for. Mrs Marshall's experiments and specimens show that bone or recent shell has, more than any other portion of the animal frame, a power of attracting or of *condensing* lime, while a counter power is exerted by the lime of hardening or solidifying the bone. This of course acts more powerfully and obviously when the bone and the lime come in immediate contact, as in the nodules of the crustaceous fossils, than in the case of the vertebrata, where the integuments interpose like a screen. Thus if portions of bone, or recent shells, be placed in a heap of sulphate of lime, or of magnesia thoroughly free from carbonic acid, with a very small proportion of vegetable matter added, and the heap so prepared be kept in circumstances of moisture, the parts in contact with the bone will first begin to harden or condense, and this action will gradually radiate to an extent corresponding to the size and form of the osseous matter, while at the same time the bone, even the soft cellular portion, becomes hard and stone-like. The very same effect is produced by and on coral; for not only does the lime harden in an extraordinary degree round the coral, but in the same ratio the latter loses its dull opaque, and becomes semi-translucent. Whether 'countless ages' would bring these to a perfect resemblance of natural fossils, it is hard to say; but a year and a half has sufficed to render them extremely curious, and worthy of attention. The experiments conducted with the constituents of sandstone and lias lead to the very same results, but much more slowly than in the pure lime.

The other problem to which we allude is this: From what cause has it arisen that many mineral substances, and even whole strata, are found identical in the nature and proportions of their constituents, yet totally different in their lithological structure? Such is the stratum frequently above coal and lime, and both above and mingled with sandstone. Mrs Marshall's experiments show that if a mass in imitation of such mineral bodies be prepared, and one part of it left at perfect rest, while the other is agitated or disturbed, the one will harden in a few hours or days into a substance not distinguishable by the eye from the natural stone, and capable of resisting water and weather; while the latter will take as many weeks to harden, and then present a mass which readily degrades by exposure to either. The experiment may be varied thus: Such masses always set or harden from the centre outwards; allow the mass to set till within half an inch of the surface; disturb what remains, and the result will be, that on making a section, the centre will be found hard enough to take a fine polish, while the outer crust will be a mere crumbling mass of chalk or sand.

Mr Hugh Miller, in his 'Old Red Sandstone,' conjectures that the curious outstriking of colours which

* Mrs Marshall, formerly of Manchester, now of Edinburgh. This lady is authoress of several popular works for children, on which, at the time they appeared, we frequently drew for the amusement and instruction of our young readers.

* We would be understood as not prepared to sanction the geological speculation here involved, though we decide on allowing the writer to state his own convictions.—Ed.

here and there occurs in that and some other formations, may have arisen from the action of decaying animal matter. Not only is this completely proved by this lady's experiment, but what Mr Miller seems not to have once suspected, that decaying *vegetable* matter has the same effect; and doubtless to this, rather than animal, are owing the more curious and grotesque forms in which these white and gray stains appear.

We were particularly interested by one specimen, in which, with the view of solving two problems by one experiment, there had been laid down upon the surface, while yet fluid, a few of the delicately-rounded leaf-stalks of the *Fucus vesiculosus*: of these some had sunk only half, and others wholly, under the surface. In course of time the vegetable matter shrinks to a film that can be blown out with the breath, and there then remains in the mimic stratum perforations which are lined with white, presenting the most perfect resemblance to those mysterious worm-like borings which occur in the face of compact limestone, and have given rise to so much discussion.

The specimens are divided into two classes—the one terrestrial, and the other marine. We are inclined to consider the latter decidedly the more interesting and curious. Patents for Britain and foreign countries have been taken for the use of this discovery. But we confess that, as devoted utilitarians, we feel a far deeper interest in the *economic* than in the merely scientific results of this discovery, curious and important though they be. Upon the principle developed, two most valuable and entirely new architectural cements have been compounded—the one pure white, the other of a greenish-gray or sage colour.

The first, after the trial of years, has proved itself a certain cure for all damp arising from porosity, or presence of sea salt in building stone, or from want of *sanctity in building even with good materials*—a cause for damp, we regret to say, fully more common than the two former.

It is not easy, on any known or alleged theory, to account for this quality in the cement; but the *fact* is incontrovertible. We have seen walls in sunk flats (done with it more than two years ago) which had been streaming with damp, noxious and offensive in its effluvia, so as to be quite uninhabitable, rendered perfectly dry, and the apartments offering a peculiarly comfortable sensation to the feelings on entering, as if a fire had recently been in them. This arises from the intonaca* being such a remarkably slow conductor of heat, that the atmosphere in all apartments plastered with it is kept at an even temperature—warm in winter, and cool in summer; whereas common lime, being a very rapid conductor of heat, speedily robs the air of all warmth in winter, and throws in great heat in summer—effects which we but partially obviate by covering it with paint or paper.

This cement also resists fire to a very high degree. Half an inch depth of it has been known to protect lath from intense fire for two hours; and even when it reaches the wood, neither flame nor spark is ever emitted—it merely smoulders slowly into a light-white ash. The cement does not, even under a red heat, crack or fly off from the wall; but if water be thrown upon it at this time, its substance and cohesion are destroyed, and it requires removal.

Dissatisfied with this result, the indefatigable experimentalist applied herself to making new combinations, and a few months since succeeded in perfecting a cement combining all the good qualities of the white, with the additional advantage (a grand desideratum indeed!) of remaining perfectly uninjured by water thrown upon it, even when at a full red heat. If a common brick, covered with one-eighth inch of it, be thrown into the heart of a large fire, and brought to a red heat, and from the fire be thrown into a bucket of water, it will

neither crack nor fly from the surface, and when dried, will bear no mark of injury, smoke and dirt excepted. Care must be taken, in laying on the cement, that no opening to the brick be left, otherwise the brick itself will rend on meeting the water.

The advantages of a cement like this, both in domestic and trade architecture, are too obvious to require argument or demonstration. If floors and ceilings be formed of it, fire may be confined to the apartment in which it originates, instead of penetrating, as in so many deplorable cases it has recently done, both in this city and Glasgow, with the rapidity of lightning, from one storey to another, upwards and downwards, through whole ranges of building. And when extinguished, no repair will be required but that occasioned by the removal of smoke and wet ashes.

Both these cements harden and dry in so short a time, that houses or apartments done with them may be inhabited in a fortnight after the plasterers are finished. No noxious exhalation—as from common plaster—or lurking damp remains in them, to injure health or property; and this alone is an immense benefit in cases of alterations, particularly in shops. They both take paint or paper the moment they are dry. But for all unpretending apartments, or for lobbies and staircases, no colour more beautiful or appropriate than that of the gray cement itself could be desired. It is considerably cheaper than the white: but this matter we refer to the manufacturer. It is, however, one of deep importance to the public, that anything preventing the scourge of fire and of damp should be brought within the reach of those building or repairing for the masses, at such a price as to remove all excuse for not using it; and here we would remark, that the rapid and thorough drying of these cements throws a large amount of saved rent to the credit side, which should be considered as reducing the expense of it. We have included damp, along with fire, as a scourge; indeed we consider it very decidedly the severer of the two; nay, we are prepared to hold that in towns it is more the promoter of death than all other causes united—not to name the misery and discomfort it entails on life. We speak of the dirt of the habitations of the poor; but damp and dirt are indissoluble in their companionship: and how often, by the cruel Pandemonium-like window-tax, is the evil deepened and (without a pun) *darkened* to the industrious poor, whose very means of existence is often connected with a free access of the blessed light of heaven to the scene of daily toil!

We have already exceeded our space, or we would refer at length to the boundless variety and importance of the uses to which these cements may be applied. On our table, at this moment, are most delicately-beautiful medallions, executed in white on coloured grounds; specimens of marble, splendid in colouring and polish; and pieces of granite and other stones, rugged from the quarry, united by it with most extraordinary firmness.

THE CRETAN DAUGHTER.

THIRTY years have passed away since the events took place of which we are now about to speak; but though this period has sufficed to change the whole face of Europe, and sweep millions from their habitations in this world, it has brought little or no change to the beautiful island of Crete. Then, as now, this bright flower of the sea was under the dominion of the Turks; and the one noble but disastrous effort by which some few years since the enslaved Cretans attempted to obtain their liberty, has left not even a trace, except in the sad hearts of the widows and orphans of those who were martyrs in the cause. At the present day, therefore, the same scene may often be witnessed which presented itself to the inhabitants of Canea, the capital of Crete, some thirty years since one fine summer morning.

It was shortly after sunrise, the hour most suitable in that climate for any active business; and the bazaars, where merchandise of all sorts was displayed, were

* Mrs Marshall has given this name to her cement—it is simply the Italian word for wall-plaster.

crowded with buyers and sellers, carrying on their traffic in the true Oriental manner by silent pantomime. These consisted chiefly of Greeks and Turks; but there were also a great number of Jews and Armenians, as well as many Egyptian soldiers. A large proportion of this motley assemblage was collected in an immense quadrangle, where a peculiar species of commerce was going forward that seemed especially to interest them. This was the public sale of human beings, which took place weekly on an appointed day. The slave traders were almost all Africans; and the unhappy captives themselves seemed to have been chosen out from among the various Eastern nations, solely with a view to the price they were likely to bring in the market. Very many, however, were Cretans, brought down from the mountains by the foraging troops of the Turkish aga, who, according to a custom not more prevalent then than it is now, was in the habit of sending small parties of soldiers over the island to sack and burn, if necessary, the distant villages, in order to bring him the young and healthy of the wretched inhabitants to be sold as slaves. These were usually taken on speculation by the traders, who then drew what profit they could from them.

The sale had been going on for about an hour with great animation, though in the most systematic manner. At last it came to the turn of an old villanous-looking Egyptian to produce his merchandise; and after having sold off one or two black slaves, he brought forward what he evidently considered the most valuable part of his stock. This was a young man and woman, whose dress and appearance indicated not only that they were Cretans, but that in their own village home they had enjoyed a certain superiority of rank. They were evidently husband and wife, and the helpless silent despair into which they were plunged, showed that captivity was new to them; for although all the inhabitants of the sunny isle of Crete were virtually slaves, yet of course a small proportion only are condemned to the unnatural ignominy of being bought and sold. Their bitter misfortune seemed, however, to have had a different effect on the young couple, according to their different dispositions. The thoughts of both, as they were put up for sale, doubtless reverted sadly to that dear home where the morning of their happy wedded life had dawned so brightly, but to fade into untimely night; that sunlit cottage, nestling in the bosom of the great Mount Ida, with the green vineyards all around it, from whence they drew their little wealth, and the myrtle bushes sheltering it from the mountain blasts. Yet the sharpness of their regrets told not equally on both. The countenance of the young man denoted only an utter and hopeless despondency, for he was not one of those to whom is given the fatal gift of intense feeling; and he evidently partook somewhat of that effeminacy often to be found in men amongst the luxurious nations of the East. Very different was the expression in the large dark eyes of his wife. Here was indeed the full capacity of suffering; and she was rapidly entering on the utmost extent of misery which even she could feel. There was something which lay nearer her heart than the liberty and the joy she had lost; and from this treasure, the gift of Heaven, she believed the unhallowed ruthless hands of man was about to sever her for ever. Clapsed close to her breast, with all the strength of her feeble arms, she held her only child, her little fair-haired daughter, the merry glance of whose sweet blue eyes had been for the last three or four years the very sunshine of her existence; and she knew—this young mother well knew—that it is not one of the least atrocities of the vile traffic of the slave dealers, that a purchaser never will consent to take the children along with the mother, unless they have reached an age when they can be made serviceable, and are no longer only an encumbrance. This her little darling would still most assuredly be considered; and she felt—for she was too utterly miserable to admit the delusion of a hope—that were she

sold, they would not scruple to tear from her that round which, by the decree of nature herself, her heart-strings were twined with a love unutterable.

The sale proceeded. A Turkish merchant of Gallipoli, after much bargaining, agreed to buy the young couple, calculating on their youth and strength, and consequent capacity for incessant labour, as the guarantee that his purchase would long be profitable to him. As usual, however, he would not consent to include the child in the agreement. The Egyptian trader, when he had stolen the young Cretan mother from her happy home, had endeavoured to separate her from the child, in order that he might rid himself and her alike of a useless burden, as he designed that she should perform the journey to the capital on foot; but she clung to her treasure with a tenacity which he could only have overcome by means of such violence as might have perilled her life; he therefore told her with a grim smile that she might burden herself as she pleased, but that he warned her he should find means to make her travel at his pace, whatever weight she might choose to carry with her. To this she offered no remonstrance; but weary, exhausted, and fainting, over hill and plain she carried her child uncomplaining—uttering not a murmur when the blows fell heavy on her, if she seemed about to sink beneath her precious burden. Now, however, the slave dealer did not require to practise even such much of forbearance; her new master might manage her as he would; but in order to perform his part of the bargain, he went up to her at once, and by main force tore from her arms the shrieking infant, whom he flung aside to perish in the street, unless some one compassionate heart existed amongst all that sordid and unfeeling crowd. No words can describe the agony that was expressed in the mother's piercing scream, as she struggled vainly in the stern grasp of her tormentors, who held her down when she would have sprung towards the spot where her little daughter lay. No words burst from her lips but those, 'My child, my child!' yet volumes would not suffice to convey to the mind the deep despair which they embodied.

Amongst the spectators was one who had witnessed the whole of these proceedings with all the horror which must fill a well-regulated and generous mind at so base a violation of laws divine and human. This was a good American missionary, who, with his wife, as good and devoted as himself, had left home, friends, and family, to aid with his best efforts the great work of the propagation of Christianity in the East. He had come to witness this revolting sale, solely in the hope that he might be of use; and he now had an opportunity of learning that such good intentions are, in this life, rarely left to lie fallow, but are ever sure to find some ailment whereon to work. His warm kindly heart had been pierced to the very core by the bitter cry of that wretched mother; and now, acting on one of those noble impulses which, if oftener felt and oftener indulged in, would brighten into day the twilight gloom in which contending good and ill have clad our world, he rushed forward and lifted up the forlorn child tenderly in his arms, then advancing as near to the young mother as the Turkish servants of her new master would allow, he said to her in her own language—'Take this with you for your comfort, poor captive victim, that your child shall have a happy home, and an unwearied protector. I pledge myself before that Heaven whose mercy has sent me to you, that I will be to her not only now, but while I live, all that the parents she has lost could themselves have been.' He had no time to add more, for the Turk had made a sign, and the other slaves were dragging away their new companions; but she had understood him: there was that in the uplifted eye and earnest truthful accents of the American which inspired her involuntarily with a perfect confidence in him, stranger as he was. It is in the very nature of a mother's love to be disinterested; and though she felt that for herself existence must be altogether dark without her darling, it was yet with a look of rapturous joy

and gratitude that she rewarded the missionary, feeling that though despair was claiming her for his own, at least all was well with her beloved child. In another moment she had disappeared among the crowded streets, following her master along with the other slaves, amongst whom walked the husband, apparently stupefied with misery.

The good missionary was left standing alone in the market-place with his new possession in his arms; but he did not regret the solemn pledge he had taken on her behalf, as the poor little child nestled in his bosom, and lifted up to him the confiding glance of her innocent eye. He took her home to his wife; and this lady being accustomed prudently to temper the warmth of her husband's zeal, was somewhat startled at the extent of the duty he had so positively promised to perform. That woman, however, must belie her very nature who could resist the claims of a helpless and deserted child; and no sooner did she feel those little soft arms round her neck, than she had taken her to her heart and home as easily and willingly as her husband himself.

As soon as the heat of the day was over, the missionary went out with the intention of ascertaining the destination of the newly-purchased slaves, that he might not lose sight altogether of the parents of his little charge. But it was already too late: he was told that the Turk had embarked early in the day with all his possessions, animate and inanimate, and had set sail no one had inquired whither. All the information he could obtain was, that he was a wealthy merchant of Gallipoli, a town situated near the entrance of the Sea of Marmora, and opposite to the ancient Lampacus. He returned home, therefore, with the conviction that this poor child, so truly an orphan, though her parents lived, was indeed a gift from Heaven, with which he was to part no more.

The months and years passed swiftly on, and the little Stamata (by which name the missionary had heard her mother call her) grew and prospered under his fostering care. Shortly after she had become one of his family, he had removed from Crete to one of the Ionian islands, where he was called on to take the superintendence of the schools which had been established there by the American mission. He had not been resident in his new abode many years before he lost his wife, and it was then that he began to reap the fruits of his good action. Stamata became all to him that the most devoted and affectionate daughter could have been: she was as sweet and engaging a child as ever lived. Thoughtful, earnest, and with a mind of very unusual powers, she secured the entire regard of the good missionary; and it was his delight to instruct her, and to cultivate her fine intellect as much as he could. She was a most apt scholar, and in the theological branch of her studies especially made singular progress; he had indeed every reason to believe that she might most ably replace him in his care of the schools when old age crept upon him; and this became his cherished hope and dream. He had thought it his duty, when she came to a suitable age, to inform her of all the circumstances of his first acquaintance with her: he found, to his astonishment, that, young as she was at the time, she remembered the whole scene of her parents' ignominious sale most perfectly, even to the minutest detail; and it was very evident that it had made an impression on her so profound, that it was likely to influence her whole life. So deep and painful, indeed, was the emotion she displayed when he mentioned her father and mother, that he at once determined never to revert to the subject, trusting that the recollection of their fate might thus in time pass from her thoughts. Whether this were the case or not, as the years wore on, he never could tell, for he dared not renew the experiment, and one of the most prominent features in Stamata's character, as it ripened into maturity, was a peculiar and invincible reserve. Slight indications sometimes revealed to him that she brooded night and day over thoughts which

she never disclosed; yet as, during the lapse of several years, the name of her parents never passed her lips, he could not but hope that, like himself, she believed that in all human probability they had long since sunk under the weight of their many sorrows, and of their unceasing labour, so that they could no longer either suffer or require to hope even for better things.

Stamata was still very young, when the schools having greatly increased, it became necessary that her adopted father should have an assistant in his arduous duties. To his infinite delight, the directors of the establishment decided that he could have none better fitted for the task than the child he himself had rendered a most able and efficient coadjutor, especially as her singular talent and great instruction were well known. Elevated to this honourable position, Stamata now entered into the receipt of no inconsiderable salary; and this circumstance was the means of bringing out a new trait in her character, which caused the missionary very great uneasiness. Every cepta (the smallest Greek coin) which she could by any possibility accumulate, she hoarded up in the most systematic manner, with all the avidity of the most covetous miser. Although just at that age when young girls are naturally disposed to spend what little they have on the adornment of their person, she employed every imaginable device to spare even what was absolutely necessary for her dress, which was coarse and plain even to meanness; but what was infinitely worse, she never bestowed the smallest relief on the many objects of charity which presented themselves.

Stamata, however, whilst rapidly accumulating a large sum of money, was far more lavish of another treasure which she possessed—and this was the first warm affections of her young heart: these she had bestowed, almost before she was aware of it, on one happily well deserving of the gift. He was a young Ionian, whose father, having wasted all his substance in a ruinous speculation, had left him to find a precarious existence by acting as interpreter to any casual stranger visiting the island. But though poor and unfortunate, Petrachi was a generous, high-spirited, noble young man, and he proved himself capable of a most devoted and disinterested affection from the first moment that he saw the gentle, thoughtful Stamata. She herself, reserved as she was on some points, was too innocent and sincere to hide her silent love from the anxious eyes of her adopted father; and when the young man honestly came to confess to him his deep and passionate attachment, the worthy missionary at once gave him not only his consent, but his promise of assistance in bringing the matter to a conclusion. This could only be, however, when Stamata should herself have realised a sufficient sum for their subsistence, as Petrachi was altogether without fortune. She was destined to arrive at what was evidently the summit of her wishes much sooner than she had hoped. The directors of the schools were so much pleased with her abilities and attention to her duties, that they decided on doubling her salary; and at the expiry of little more than a year from the period of Petrachi's avowal of his sentiments, she found herself in possession of what in that country was considered quite a small fortune. The young man had been repeatedly urging her adopted father to release him from his promise of silence on the subject nearest his heart; and when this occurred, he at last obtained his leave to go and formally ask her in marriage, as the good missionary thought that now the sooner the matter was concluded the better. Petrachi left him joyously to go and seek Stamata, full of hope, which the old man thought most justly founded; but his amazement was very great when, a short time after, the young man burst into his room in a state of utter despair, and besought him to go and remonstrate with Stamata, who, he declared, had positively refused to marry him, even while she honestly confessed that she loved him very dearly. The missionary was exceedingly astonished and perplexed at this intelligence, for

nothing could have been more evident than the warm attachment with which the young man had certainly inspired her; and he could hardly credit the idea that his child had grown capricious or inconstant.

An explanation of this incomprehensible circumstance soon ensued. Stamata informed her foster-father that so far from having ever forgotten her parents, or allowed time to deaden her feelings towards them, she had, on the contrary, lived month after month, and year after year, in one only and fondly-cherished hope; which was, that she might herself be the means of restoring them to liberty; and this project had been her dream by night, and her sole thought by day. She had ascertained from a Turk, resident in the island, what was the price usually asked for a male and female slave; and to earn this sum she had toiled, and laboured, and deprived herself not only of every personal gratification, but of that sweetest of earth's joys—the relief of the suffering—in order to accumulate the necessary funds for this purpose, more than any other just and holy. Silently, and taking counsel from no one, she had matured her plans with a strange mixture of reckless courage and shrewdness, and it was evident that she would follow them up in spite of all obstacles. She appeared never to have entertained the idea that it was possible her parents might no longer require her care: it was her conviction that they yet lived, and on this she acted. She had carefully concealed her hopes and wishes from the missionary, because she knew his kind heart too well not to be aware that had he known how much her whole happiness depended on her success, he would at once have drawn on his own little store to furnish the sum she required; and from such an additional sacrifice on his part her generosity revolted. He had indeed done enough for her already—far more than she ever could repay; and it was from her only that her parents ought to claim the self-devotedness and unwearied exertion which it would require to procure their liberty. That she loved Petrachi, she made no attempt to conceal; but from the first she had been so determined to devote herself and her fortune to her one pious effort, that she had taught herself to hope that his silence had proceeded from indifference; and now, though it pierced her to the heart to find that he also was doomed to suffer by her honourable resolution, yet when the missionary called him in to take a part in the consultation, she would hold out to him no hope that his wish might ever be fulfilled, for it would take all her little portion to purchase her parents' liberty, and she could not bid him wait, wasting his youth and life, till she should have time to amass another. Petrachi's eyes told her he would wait whether she wished it or not; and his look of warm affection seemed to render her desirous of hurrying on to a more complete detail of her plans.

What she had already told them, she said, was merely a retrospect of the thoughts that had engrossed her whilst patiently labouring to earn the money requisite; but now the time was come for her to act, and one cause for her bitter tears had been the consciousness that she ought, without delay, to abandon all that was most dear to her on earth, in order to prosecute her scheme, now ripe for execution. Fortunately, she said, a family with whom they were intimate were about to set sail from the island for Constantinople, and they had agreed to take her so far as Gallipoli, where, if her parents lived, it was likely they still were. If they should, however, be elsewhere, she would follow them; and she had made every preparation for her expedition, having already sewed the greater part of her precious money into the crown of her red *fey* (or cap), in order to secure it more completely. Petrachi and the missionary saw well that it would be vain to attempt to dissuade her from the cherished project of a lifetime; but they both remonstrated loudly against her going alone on this perilous expedition. Stamata, however, displayed a degree of firmness, and even of obstinacy on this point, which they could only attribute to some secret motive;

nor did she deny, when they questioned her, that she had indeed a private reason for refusing to be accompanied by her friends; besides, she showed them, with her usual prudence, that it would have been impossible, at all events, as Petrachi could not have been a suitable escort; and the welfare of the whole party perhaps depended on the old missionary continuing to conduct the schools in her absence, lest they fell into other hands. Finally, after a long and painful conversation, the old man decided that she was to follow her own arrangements; for he was one of those who would always prefer to see the beings he loved perish in the performance of a good action, than live even prosperously in the neglect of duty.

The family under whose escort she was to quit her dear home and dearer friends were to set sail in a very few days, and the old missionary did not regret that it was so; for although he saw that Stamata was perfectly firm in her resolve, it was evident at the same time that she suffered most deeply, and also that she appeared to consider this separation as one likely to be final, which seemed to him little likely. Had he known the secret resolution which caused her so to think, and had indeed seen the reason of her refusing to allow any one to accompany her, he would assuredly have died before he allowed her to leave him. She had determined that if the power of gold should fail, as sometimes happened, or if the sum she possessed were too small to restore her father and mother to the freedom which was their birthright, she would adopt a means she was sure would not fail to liberate one at least, by offering herself as working slave in their stead. Such a resolution as this was no less dreadful to Stamata than it would have been to a free-born British girl; for it must be remembered that not only was her mind highly cultivated, but she had been educated by an American, who had not failed to teach her all his own liberal ideas; although along with them he had also given her those high and noble principles which made her prepare so calmly to undertake the horrors and the ignominy of slavery for the sake of those who had been to her, indeed, parents but in name.

The day of separation arrived. Followed by the prayers and tears of those to whom she was so dear, the devoted daughter left her happy home; but even those who loved her best could scarcely comprehend the violence of her grief, for they knew not to what an extent she meant to carry her sacrifice. Her most bitter trial was over at last, however: she saw the figures of the good old missionary and Petrachi, who had promised to be to him a son, receding in the distance; and soon she could see them no more, remaining all alone with the dread that she never might see them again. Amongst the passengers who were sailing with her, Stamata found, to her great joy, that there was a Greek resident habitually at Gallipoli, whither he was now going, along with his mother, a very shrewd and pleasant-looking old woman. With these people Stamata eagerly made acquaintance, thinking it very probable that they might know something of the Turk who had bought her parents, and whose name she well remembered. She was not mistaken; they knew him perfectly, as he was the most influential merchant in the town; and what was still better, the old Greek lady had often been in his harem, where she had much traffic with the principal wife in the sale of henna, black dyes for the eyebrows, and so on. She was happily quite a person to become acquainted with the most minute details of every one's establishment, and she knew the names of every individual slave. That Stamata's father was amongst them she positively affirmed; for she said she even recollected well the circumstances of his purchase, from the ill-humour manifested by the Turk when he found his bargain likely to prove unprofitable, as the poor mother, bereaved of her child, had drooped and died within a few months. At this intelligence Stamata's grief was excessive; for it was the recollection of her mother's

parting scream that had so steeled her heart against all the joys of life, which for her sake she had sacrificed. But when the old woman proceeded to tell her that the Turk had vowed to make the survivor work for both, and that the consequent toil and torture which her wretched father had endured for years was not to be told, she at once subdued her sorrow for her she had lost, in order to secure the freedom of him who yet remained. Stamata, with all her talent, was guileless and unsuspecting as a child, and she at once opened her heart to her new acquaintances, telling them all her hopes and plans, and even the precise sum which she carried with her for the attainment of her object. At this last piece of intelligence the eyes of mother and son sparkled in a manner that would have put her on her guard, had she known a little more of the world, or even of those countries in which she had resided all her life; for she would then have known that in the East the most worthless characters are sure to be found amongst those persons who, like her new Greek friends, abandon their own land and national peculiarities for those of any country where it may be their interest to reside. Indeed one a little more acquainted with evil in its many shapes than poor Stamata, would have found reason to doubt the sincerity of her newly-made acquaintances, from the very warmth and vehemence of the protestations of friendship and interest with which they now assailed her. But she judged others by herself; and feeling she would have done precisely the same had the case been reversed, she felt no surprise when they invited her, with every appearance of disinterested kindness, to come to their house with them on arriving at Gallipoli, till such time as she could obtain an entrance into the palace of the wealthy merchant. She thankfully accepted this offer, as they promised, without any difficulty, to procure for her an opportunity of entering into the desired negotiation, probably with the wife of the Turk, whom the old lady knew so well, as he himself they believed to be absent on an expedition of some importance.

After a most prosperous voyage, Stamata landed at Gallipoli with her friends, and proceeded at once to their house. Her impatience was now so great, that the old Greek lady could not refuse to gratify her by going at once to visit the harem of the Turk, and prepare the way for Stamata's own negotiation. She was absent some hours, but she returned with the most satisfactory intelligence. She had seen Stamata's father, who had heard that there was a chance of his being restored to freedom with a frantic joy which seemed to have excluded all other sentiment, even the natural pleasure of a parent in recovering a child lost to him for so many years. She had also seen the principal lady of the harem, who had full authority, in the absence of the lord and master, to act in such matters as these, and from whom she had obtained the positive promise that she would accept the sum Stamata had to offer in exchange for her father's liberty. The old woman had also arranged that the interview was to take place next day at an early hour. After having been thus assured that her long-nourished hope was so soon to be fulfilled, Stamata enjoyed the first good night's rest she had known for a considerable period; and although she shared the room of her hostess, she slept too soundly to be aware of any movement which might have taken place there during the night.

The next morning the Cretan daughter proceeded alone to the dwelling of the Turk; and now, when she seemed at the summit of her wishes, it was decreed that her trials should begin. The first bitter disappointment she experienced was caused by her father. On the mind of this man, never remarkable for any very fine qualities, slavery had worked like a corroding poison; self was his idol, and the only boon he craved for that self was his restoration to liberty. Years of torture and captivity had effaced from his soul all other thoughts and feelings, and this one frantic desire alone engrossed him. When he came forward to meet his

generous daughter, a wretched, decrepit, abject old man, he uttered not one word of joy that he beheld her again, or of thanks for her noble sacrifice; but he called out to her in a feeble, querulous tone, to intreat that she would make no delay in procuring his liberty, by paying down the necessary sum for his ransom, as surely he had waited long enough. It must not be denied that Stamata felt a pang of regret at this destruction of many bright day-dreams, in which she had pictured to herself her first interview with her father; but happily she had commenced this undertaking from a high sense of duty alone, and the duty remained as urgent as ever, however little worthy her surviving parent might be of her tender care. She followed him into the presence of the merchant's wife, and was told by her that immediately on the receipt of the ransom, both father and daughter should be at liberty to depart. The old man's eyes glistened at the word; and Stamata, hastily taking off her fey, almost tore out the lining in her eagerness to produce the money. What was her consternation on finding that it was gone, and a few stones substituted in its place, that she might not miss the weight when wearing the cap! For one moment, at this irreparable misfortune, Stamata almost felt her strong trust in Heaven abandon her; she did not, in her guilelessness, dream of suspecting her hostess of the night before, but she believed that, when asleep on board the vessel, it must have been stolen from her, so as to deprive her of all hope of recovering the sum she had so toiled to earn. To add to her misery, the father, as he saw the cup of joy dashed from his lips, became half maddened with the revulsion of feeling, and uttered something very like a curse on his unhappy daughter. The blood rushed back to her heart as she heard it; but mastering her anguish, she turned to the merchant's wife, and made one more attempt to perform her noble duty. She offered herself as working* slave in exchange for her father. The offer was accepted: the strong healthy girl was a good substitute for the decrepit old man; and he was told that he was free, and might leave the establishment at once, since his daughter remained in his stead. At this announcement he uttered a wild cry of rapture, and flew towards the door, as though he could not endure one moment more the captivity he had borne for years; and not by one word or look did he sweeten to Stamata the bitter portion now assigned to her; but she stopped him in his flight—it was only, however, to give him a few ornaments she had received from her beloved friends, now more than ever lost, and by the sale of which she intended he should pay his passage from Gallipoli. One only request she made to him in return for all she had sacrificed: she implored of him to go to her adopted (and far dearer) father, in order to inform him of her fate; and having obtained his promise that he would do so, she saw him depart, and heard the prison doors (for they were such to her) close after him, to hold her captive there for ever.

Stamata entered at once, silent and uncomplaining, on her new and laborious mode of living. In all her ideas and feelings she was as much of a Christian and a European as one who had never left Great Britain could have been; it may therefore be imagined what it was to her to become the slave of Turkish slaves, which was, in fact, the position she now held, and that without a hope of any change; for she felt by no means sure that her unworthy father would even fulfil his promise of communicating her position to her friends. In this she was mistaken: he was not altogether dead to natural feeling, and he faithfully performed her commission, for which he was rewarded, by being received into the missionary's house. The American, as well as Petrachi, would have been in positive despair at the intelligence he brought, had not Providence meanwhile been raising up friends for the Cretan daughter in her hour of need.

* There is a distinction between the slaves so called and those of the harem.

Amongst the strangers who had lately visited the beautiful island where the missionary dwelt, was one of his own countrymen, a man of enormous wealth, and, what is rather more rare, a man who rejoiced in his wealth as a means of doing good. He had been deeply interested in the story of Stamata, and had communicated to her adopted father and to Petrachi his intention of restoring to her the portion she had so dutifully sacrificed, in order to enable the young couple at once to marry and settle for life. When the Cretan slave, therefore, brought the news of his noble daughter's miserable fate, this good rich man thanked Heaven that he had visited the island just at this period. Not an hour elapsed before he was on his way to Gallipoli; there he offered the merchant's wife any sum she pleased to name for her new slave Stamata; and having joyfully paid the very exorbitant price she demanded, he brought the noble girl back to her beloved home, there to reap the reward of her dutiful conduct. His good works did not stop here: he settled on her a sum quite sufficient to enable her to marry Petrachi, and lead henceforward a most happy life—ever tending and caring for her real father with all due consideration, whilst she was at liberty to cherish with a far deeper affection the good old missionary, who had been at least the very life of her mind and heart.

NATIONAL EDUCATION—ITS OBSTRUCTORS.

It is strange how long a point of polity may be established with entire success in one country, while in another the very first principles on which it is based may be the subject of fierce controversy, as if there were no voice to be had from experience in the matter. A system of education in which the secular part is provided for in schools where all sects may meet, while the clergy are permitted to impart religious instruction at certain convenient times apart, has been long established in various countries—as Prussia, Holland, and the United States—and its results are most satisfactory. Yet when this plan is proposed in Britain, it meets with such a storm of objections, as only might be expected to arise against some altogether unheard-of novelty. The chief of these objections it is easy to trace to the anxiety of other institutions about their own interests. At least it appears to us that any real fears on the score of religion may well be quieted, when a body so respectable as the United Presbyterian Church of Scotland sanctions the plan without reservation, professing that, while 'it is not inconsistent with the legitimate functions of civil government to provide for the secular instruction of the subject,' the religious department 'belongs exclusively to the parent and the church.' Perhaps much of the struggling towards a different point is only attributable to the excited state into which the community has been thrown by the political fervours of the last few years. It would certainly, however, be a great pity if, from whatever cause, or with whatever motive, our movements for improved means of education were to land it only more entirely than it has hitherto been in the hands of persons who regard it primarily as a means of maintaining or improving their own place as churches or denominations. This were to make the heart and soul of the country, and all their future tendencies, the subject of a mere scramble for the human selfishness involved in propagandism. It might not much cramp the development of the national intellect, for here we think the press gives good assurance that progress is irresistible; but it could not fail to postpone the day when the best secular effects of Christianity, in the binding of men together as brothers and equals, were to be realised—thus inconceivably damaging the very cause it was professedly meant to advance. At present, we have fully enough of division of one kind and another—from that which wealth produces, to that resting in diversity of opinion on religion and its externals. Who could

undertake to estimate the probable increase of mutually-repelling antipathies, if children were all to be trained under a system which should rank them up in visible separation from each other, and teach each little group to regard with aversion all that belonged to the rest? It seems to us as if, in such a state of things, added to the jealousies of employed towards employers, of industry against rank, and rank against industry, we should be involved in something not greatly different from, though not bearing the name of, civil war.

Such a danger is ridiculous as well as deplorable, when we consider that the whole question under dispute is merely one of arrangement of time and place. It is a mere matter of detail as to school hours. What difference there can be between the imparting of certain ideas, or the inculcation of certain feelings to children all at once, in one room, and doing this in a room set apart for the purpose, we are totally unable to imagine. And how this should appear so objectionable, when it is only done for the sake of impartiality towards various sects all standing on an equality in their right each to entertain its own opinions, is equally inconceivable to us.

Another, but much less obstructive difficulty, lies in the opinion of a small but active sect, which maintains that the state has no title to interfere with education. It is true that a government with opposite interests to the people would be seriously mischievous in exercising arbitrary authority over education. This, however, is to misstate the present case. The system of national education generally contemplated, requires only legislative shape and sanction to be given to a system which shall be conducted and paid for by the people themselves. A right national system would be as much a matter of popular administration as our municipal or police bodies. Such is the plan embraced by the Lancashire Public School Association, who are about to come before parliament for an act to realise their views in that section of England. The part which our government is at present taking in education is unfortunately of a different character—a paltering with the contending selfishness of sects, to not one of which it can afford to say what it really thinks. But that is not an example of national education—it is only one of the miserable make-shifts appropriate to a time of transition.

The time seems come, or coming, when serious efforts would need to be made in order to prevent bad systems from becoming inveterate, if not to cause a right one to be established. We have done what little we can to attract attention to the subject, and to put it in what we think a right point of view. Let us hope soon to see some energetic movements on the part of those who are favourable simply to public and human, as distinguished from sectarian interests. It will be a shame to burn for ever, if they let judgment go against them by default.

CHICKEN FACTORIES.

SOME years ago we described a process for hatching chickens which we saw in operation in London, and since that period, other plans for the same purpose have been attempted with less or more success. It seems to be one of those things on which many ingenious minds have employed themselves from very early times; the transforming quantities of eggs—a comparatively cheap article—into fine marketable poultry on a great wholesale principle, being invested with that degree of possibility which recommends it to the thoughtful and enterprising.

Most of the plans for artificial chicken-production have somehow or other failed, at least to the extent of being generally appreciated. The public have been for a short time entertained with accounts of their practicability, but they have never become part and parcel of our economy. Hens continue, as they have done since the beginning of the world, to be the hatchers of their own eggs, and nurses of their own chicks. Steam, which now-a-days does such wonders, has not yet been

able to assume the function of the decent motherly barn-door fowl. The latest enthusiast in artificial hatching is W. J. Cantelo; and in a pamphlet from the pen of this gentleman now lying before us, we are assured that he has at length discovered the cause of the want of success in previous artists, and is able to furnish the grand desiderata—artificial hatchers to any extent, and of unvarying accuracy.

According to Mr Cantelo's theory, all previous processes have erred in not following nature. Eggs have been put into ovens at a certain heat; but although this will not invariably fail, it is not what experience points out as proper. Nature does not employ ovens, so as to heat the eggs all round; it hatches by *top contact* alone—the warm feathery breast of the mother pressing gently on the eggs placed beneath her in the nest. 'All have overlooked the meaning of the word *incubate*—"to sit upon"—and the necessity for carrying out in their experiments the principle involved in that expression.' Avoiding the error here mentioned, Mr Cantelo has invented an apparatus called the 'Patent Hydro-Incubator.' This machine, which resembles a cupboard, is furnished with trays or drawers, into which the eggs are put. Gently pressing on the top of each tray of eggs, lies a bag of impermeable cloth filled with water, which, by means of connecting tubes with a cistern and boiler, is kept at the desired temperature (106 degrees Fahrenheit). Air is allowed to circulate around and through the trays, by spaces left for the purpose. 'The fowl naturally leaves her nest every day, in search of food, for twenty or thirty minutes; this we must imitate also, as the cold has the effect of causing the air in the vacancy of the egg to contract, whereby a fresh supply is drawn in for the nourishment of the germ. The eggs must be turned or moved about twice every day—that is, at intervals of twelve hours—which prevents the adhesion of any part of the egg to the shell, and also gives the small blood-vessels a better opportunity to spread around the surface of the egg in search of nourishment for the germ. This is effected by nature; for as the fowl leaves her nest, or returns to it, and also when changing her position upon her nest, she unavoidably disturbs the eggs.' Such is Mr Cantelo's explanation, which we believe to be more ingenious than correct. It is certain that some hens never leave their nest during the period of incubation, but require to be fed where they sit; and if so, cooling the eggs for a length of time daily seems as unnecessary as the theory respecting it. Be this as it may, the eggs in the incubator are enjoined to be drawn out and turned every twelve hours; 'and once every day, after the first two days, they are left out until nearly cold, say twenty or thirty minutes.'

After describing how the eggs should be occasionally examined, in order to remove the 'suspected,' we are told that 'the hatch should begin pecking at the expiration of nineteen days and a half; thus, supposing a number of eggs to be put to incubate on Thursday, at five P.M., on the Wednesday morning previous to the expiration of three weeks, I should expect many to have pecked, and some even to begin to come out. Those which have not hatched of their own accord, on the Thursday morning, may be reckoned (provided the heat has been kept up to the right point) as good for nothing, even if taken out of the shell; that is to say, those which are last are worth least. If the eggs hatch sooner than this, lower the heat; if later, raise it: as you can tell only *nearly* the heat of the incubator by placing a thermometer under it, lower or raise your heat only one degree at a time. You must be very near the correct point when the thermometer placed in the tank indicates 110 degrees, as then your incubator will not be far from 106 degrees.' What follows is physiologically curious:—'Stale eggs often produce ill-formed feet or legs, and the same effect is produced by oven-hatching, and even by the new process occasionally, when the water is kept at much too low a temperature; but with a proper heat and fair eggs, a deformity

of the chicken will scarcely ever be found under the Cantelonian system. In all cases of deformity, it is most economical and humane to destroy the chicken. If a *cross-bill*, it always grows worse, and will finish by not being able to eat at all; and a *stiff-leg* is pulled about, and made miserable by the other chickens; and inasmuch as a deformed chicken would not have left the nest of the mother, it is not worth while to attempt to do better artificially. I have hatched a duck with three legs—that is, an imperfect and extraordinary one proceeding from below the root of the tail. This lived and did well, as it had two good legs to stand upon; but the third one was often pulled at by the others.' Being at length hatched, and fairly on their legs, the chicks 'may be gathered in a warm place over the incubator, or tank, in order, when dry, to be placed under the *mother*. This consists of a number of warm pipes, about an inch and a quarter in diameter, and about the same distance apart, resting on supports about five inches from the floor. Beneath these pipes is a sliding board, which is always at such a height as to allow the backs of the chickens to touch the pipes, and which is gradually lowered as they increase in size. This board is removed and cleaned every day, or replaced by another, which had served the day before, and had been cleaned and aired during the twenty-four hours. Above the pipes (about an inch and a half) is another board, similar to that below, from which depends a curtain, in front of the *mother*. This board serves the double purpose of economising the warmth, and preventing the chickens from dirtying each other, as they are very fond of jumping up on the *mother*. The pipes above described proceed from a small tank of warm water, the heat being kept at about 104 or 105 degrees. The young chickens having been once placed beneath this mother, will only leave it to eat, drink, and for exercise, and will return to it of their own accord. At four weeks old, the chickens must be removed from the mother, and placed to roost on small perches, three feet and a half from the ground, in a warm place; and every evening, when they go in, they must be put up to roost, as you have no fowl to entice them. In a few evenings they will go up of their own accord, and at six weeks old, they may be put up in a place to roost permanently. Too great crowding of the chickens must be avoided at all times, as this of itself will create disease. Should any appear, such as sneezing, or watery or sore eyes, those affected must be picked out with the greatest care, and killed.' The chickens should have a piece of dry ground for exercise, and be fed on seeds, grain, grass, worms, or a little chopped meat. 'When very young, or during bad weather, they must be fed in-doors.'

The 'Patent Hydro-Incubator' is of different sizes, from one at twenty guineas, which will hatch 100 eggs, to one for 1000 eggs. 'It is not pretended that the patent incubator will hatch and bring up every egg to a fowl. From twelve to thirty per cent., after great experience, has been found to be the discount. A one-tray machine will enable the party who properly attends to it to produce, on the average, 75 birds to a hatch, and 18 of these in the year, being 1350 fowls. A very different result, indeed, to a hen, which sits but twice in the twelve months, and does not rear up above eight chickens at a hatch. A two-tray incubator and one mother will produce 2700 a year; and so on in proportion—a thousand-egg machine being capable of producing 13,500 full-grown fowls per annum. There is nothing in the principle to prevent millions of eggs being hatched eighteen times in a year by one machine. Hens generally lay eggs after being six months old, but the Cantelonian system does not anticipate keeping a tenth of the poultry for laying stock, so that the quantity and profits arising from eggs are not here taken into account. To feed up an ox to twelve hundred pounds weight usually takes five years; to feed the same weight of poultry can be accomplished in ninety-six days, at less than half the cost for food. This makes the return

quicker, and a small capital employed in the Cantelonian poultry business to do wonders.*

We have followed Mr Cantelo to the end of his description, as it was proper to do, considering the interest which is attached to the subject. That his plan is one of the most feasible yet presented, there can be little doubt. We have no fault to find with his mechanical ingenuity. His incubator will hatch chickens by the million, and the cost of doing so will be comparatively a trifle. If nothing else were wanted but hatchers, hens would never more be heard to cluck, and all the world would grow fat on poultry. The misfortune is, that Mr Cantelo, like his predecessors, has not invented a patent process of feeding as well as hatching. It is easy to bring the chick into the world; but the question is, how we are to find it in food when it gets there? Our author speaks of hens generally laying at six months old; whereas they rarely lay till they have reached nine or ten months, and then their eggs are very small. At ninety-six days old, as we understand, chickens are to be ready for market; had Mr Cantelo said six months, he would have been more correct, for fowls do not fatten till they have done growing. The whole difficulty, therefore, resolves itself into a question of economy. Would it be possible to feed fowls on a great wholesale principle with bought food, for six months, so as 'to pay?' We are pretty sure it would not. Fowls cannot be fed by the hundred or the thousand any more than by the dozen, with any prospect of remuneration, unless the food is got for little or nothing. Some housewives, in fits of thrift, fall into a frenzy about keeping fowls: they are to have such delicious new-laid eggs every morning to breakfast, and such tender well-fed fowls for dinner, and all at such a mere nothing of expense! What is the result? Each egg costs at least sixpence, and every fowl five shillings or more! On this account we fear that, after all, mankind must just leave chicken production to those farmers' wives who are provided with barn-yards, or those cottagers who are not above allowing their fowls to pick up food from the doorways of their neighbours; and to such, incubators on a small scale can alone be of any value. Fowls, in short, can be reared advantageously only on *waste*, and where there is a run, free in every sense of the word. If we are wrong in this assumption, which seems to us borne out by all ordinary experience, we hope Mr Cantelo, in the next edition of his work, will prove it by facts that cannot admit of controversy. Until he does so, we are constrained to believe that the notion of 'chicken factories,' however specious, must take its appropriate place among ingenious but impracticable projects.

M O R O C C O.

Few persons in Europe are aware of the extraordinary policy of the emperors of Morocco, and few therefore were prepared for the solid support received by the Sultan Abd-er-Rahman from his subjects when attacked by so formidable an enemy as Abd-el-Kader had proved himself, by his religious and military prestige, as much as by his unbounded activity and energy.

The policy, however, which has made the fortune of the Edrisite dynasty, has at all times been a very simple one—namely, with foreign powers, no relations, complete isolation; and at home, *alliance with all the great families of the kingdom*. This double line of conduct explains the existence and the strength (if 'union is strength') of the empire of Morocco. Let us enter more fully into the particulars of this twofold system,

the originality of which will not fail to surprise those of our readers who may not be familiar with the ideas and principles of Oriental monarchies.

Morocco, in its geographical position, stands almost isolated. It is bounded on the west by the Atlantic, on the north by the Mediterranean, on the east by Algeria, which, up to the period of the French conquest, seventeen years ago, counted as nothing; and on the south by the Desert, and different tribes who obey no form of government. It was not difficult, therefore, for the founders and successors of the dynasty of Morocco to enclose themselves in a moral manner within a species of insurmountable barrier—that is to say, to have no relation with foreign powers. This they have done. No commerce, no diplomacy. They have imprisoned themselves in their own country; they have lived, and made their subjects live, in a perpetual enclosure, the country sufficing, by its own resources, for the few wants of its inhabitants. What has been the result of this singular policy? That this monarchy has had to engage in no foreign wars, and thus has been enabled to consolidate itself without fear of any dangerous foe.

Being unapproachable by enemies from without, they have turned their thoughts to avoiding hostility in their own territories, and the following is the plan they have adopted for centuries:—

Since the foundation of the dynasty, every reigning monarch has taken a wife from every important family of the country. Any of those who have reigned twenty or thirty years, like the two last sovereigns, Mokei-Sleinau and Moulei-Abd-er-Rahman, have numbered two or three thousand wives from the great families alone. At the present moment, Abd-er-Rahman has no less than seven hundred lawful consorts—namely, two hundred at Morocco, two hundred at Mecknez, and three hundred at Fez. It is to this multitude of ladies, whose support is ruinous, that the low state of the imperial treasury must in a great measure be attributed. Let it not be imagined that these are unhappy concubines, kidnapped by the eunuchs for the seraglio; they are seven hundred daughters of the great families of the empire, who wait for and desire a fruitful marriage, to return then to their paternal home, with a young cherif, son of the sultan! The result of this matrimonomania is, that the emperors, when they reach the age of sixty, like Abd-er-Rahman, can number hundreds of male children fit to carry arms, thousands of grandsons, and thousands of nephews and grandnephews. If you unite this little army, which derives its blood, its life, from one single source—the fathers-in-law, brothers-in-law, the cousins to the sixth degree inclusively—you will arrive at the strange but positive conclusion, that of eight millions of subjects, one million of individuals belong by the strongest ties to the reigning dynasty.

This may seem monstrous, but it is nevertheless the exact truth. There are whole towns and districts whose inhabitants are offshoots of the imperial family. Thus all the Chourfas of Taflet are cousins, in various degrees, of the emperor. We can mention a fact which confirms, in an undeniable manner, all we have now stated. When General Delarue was about to define the boundaries of the eastern part of Morocco, he ceded a portion of the Ouled-Sidi-Cheikh people to the emperor. Sidi-Homza, chief (sheikh) of this tribe, solicited Abd-er-Rahman to admit one of his daughters into his harem, as a pledge of his faithful alliance with his new master.

But the imperial policy does not stop here. All those with whom the emperor, from peculiar considerations, cannot form connections by ties of blood, such as Moors, Jews, and Christians, if they be of any weight, he chains to his chariot by the link of commerce, of which he reserves to himself the exclusive monopoly. He not only gives to some the privilege of buying and selling such and such an article in such and such a port, but he constitutes himself their banker, and lends them the money necessary for their trade. Some of these loans have amounted to L.80,000. When the Prince de Joinville

* We shall be saved much trouble in answering inquiries, by stating that orders for incubators may be directed to Samuel Gant, 19 Tottenham Court Road, London, or Mr Cantelo, at his temporary establishment, Chiswick. All necessary information, including the pamphlet referred to, we presume, may be had from either of these parties.

bombarded Mogador, he was told that the merchants of that place owed £800,000 to the emperor.

Here, then, is a man who holds in his hands, either by relationship or by interest, almost all the chief resources of his kingdom. His patronage and his strength are increased by the prestige of holiness which he derives from his titles of 'Lineal descendant of the Prophet,' and the 'Head of Islamism in the West.' At the hour of need, he could also count on the valuable assistance of the order of *Moulet-Taleb*, a religious association, as powerful as it is numerous, and whose chief, being invested with the privilege of sanctioning the nomination of the emperors, is necessarily, from his position, devoted to the existing dynasty.

THE REGISTRAR-GENERAL ON INFLUENZA.

The last quarter of 1847 was so painfully remarkable for the mortality from epidemic diseases, that a brief summary of the facts may be worthy of general circulation. According to the Report of the Registrar-General, just published, the number of deaths for the three months ending in December was 57,925, being 11,376 over the average, as computed from previous years. It must be borne in mind that the returns are not for all England, but from 117 districts only, comprising a population of about seven millions. Taking the December quarters of the last three years—in 1845, the deaths were 39,291; in 1846, 53,093; and 1847, as above stated.

A slight increase in the mortality was noted in the returns of the *June* quarter, 1846; the mortality in the following hot summer, when the potato crop failed, was excessive; *cholera* and *diarrhoea* were epidemic. In the autumn of 1846, as well as the winter and spring quarters of 1847, the mortality was still higher; scurvy prevailed in the beginning of the year, but in the summer the public health appeared to be slightly improved. Epidemics of typhus and influenza, however, set in, and made the mortality in the last quarter of 1847 higher than in any quarter of any year since the new system of registration commenced. . . . The deaths in the year 1845 were 166,000; in 1847, *two hundred and fifteen thousand*. The excess in 1847 is *forty-nine thousand* or not less than 35,000 over the corrected average of 1839-45.

The deaths in London for the December quarters of the three years 1845-46-47, were 11,838, 13,221, and 18,553; the increase in the last instance being as marked as in the general results. It has been shown that if the chance of dying in the country be set down as 2, it will be 3 in London; and in case of epidemics, it will be greatly increased. Dearthness of provisions, and extraordinary meteoric influences, are put forward as immediately exciting causes. Thus we read that 'on Tuesday, November 16, there was a remarkable darkness; the wind changed to north-west, and amidst various changes, still blew from the north over Greenwich at the rate of 160 and 250 miles a day. The mean temperature of the air suddenly fell from 11 degrees above, to 10 degrees below the average: on Monday it was 54 degrees, on Friday 32 degrees: the air on Friday night was 27 degrees—the earth was frozen: the wind was calm three days, and on Saturday evening a dense fog lay over the Thames and London for the space of five hours. No electricity stirred in the air during the week: all was still, as if nature held her breath at the sight of the destroyer come forth to sacrifice her children. . . . Influenza was epidemic. On the first week of December *two thousand four hundred and fifty-four* persons died—1141 were males, 1313 females; 1012 children, 712 in the prime of life, 730 of the age of sixty and upwards. On the week following, *two thousand four hundred and sixteen* persons died—1175 males, 1241 females; 702 of the age of sixty and upwards. . . . Altogether, the epidemic carried off more than 5000 souls over and above the mortality of the season. The epidemic attained the greatest intensity in the second week of its course; raged with nearly

equal violence through the *third* week; declined in the *fourth*, and then partly subsided; but the temperature falling, the mortality remained high not only through December, but through the month of January.'

The facts here exhibited have a prospective as well as present interest: it is a step towards determining the mode by which contagion is diffused by means of the atmosphere—a subject on which the learned are as yet altogether in the dark, the analysis hitherto made having failed to detect any difference between the purest air from the top of a mountain, and that from the pestilential courts of a crowded city. Still the fact appears to be certain, that the spread and progress of disease is mainly dependent on the state of the atmosphere. The preponderance of female deaths is accounted for by the fact, that there are always more females than males living in London, particularly after the age of fifty-five. 'Influenza attacked those labouring under all sorts of diseases, as well as the healthy. The vital force was extinguished in old age and chronic diseases. The poison, permeating the whole system, fastens chiefly on the mucous membrane lining the sinuses of the face and head, and the air-tubes of the lungs.'

In the Metropolis, as well as in the country generally, certain districts were more severely affected than others. In Edinburgh, 'influenza suddenly attacked great masses of the population twice during the course of November: first on the 18th, and again on the 28th day of the month. It appeared, in both cases, during keen frost, and an excessively damp, thick fog, which came on rather suddenly after a few days of very mild weather.' London, it appears, was visited before Paris; in the latter city, nearly one-half of the population was laid up with the disease during the first week of December. In Madrid, 50,000 persons were attacked. In Constantinople, the disease prevailed in August and September, and has been succeeded by a species of cholera. When the epidemic broke out in Europe in 1782, it was four months travelling from England to Spain; on the present occasion, its appearance has been almost simultaneous in different countries. No information has yet been received of its progress in Italy, Germany, or Russia.

Appended to the Report are brief statements respecting the influenza epidemics that have appeared in this country since 1728. The temperature and weather in 1733 seemed to have been very similar to that of the last three months of 1847; and according to the meteorological records, the next analogous season was in 1806; the epithet 'extraordinary' is not therefore misapplied to that just gone by. 'Extreme cold only,' we are told, 'never raises the weekly mortality in London above 1500; extreme heat still less; intermediate changes affect the mortality but slightly in ordinary circumstances. . . . When once generated, the disease spreads through the air. The great epidemics generally travel from Russia over Germany, Denmark, Sweden, England, France, Italy, Spain, in from three to six months; and then reach America. Influenza is often associated with other epidemics. It appears to have preceded or accompanied the plague, in the Black Death of the fourteenth century; it preceded the great Plague of London, 1665; it followed epidemic typhus in London, 1803; preceded it in 1837; occurred in the midst of typhus epidemic of 1847; preceded and followed the epidemic cholera in 1831-2-3.

The English physicians of the eighteenth century agreed in pronouncing influenza *contagious*. By this they did not mean that it was propagated by contact; but that it was introduced into cities, institutions, and houses in England by persons actually affected by the disease. This notion is, however, too exclusive: the word 'contagion,' applied to influenza or cholera is apt to mislead, and to have practically a bad effect. When people ask if a disease is contagious, they generally mean, 'Are we likely to have influenza or cholera, if we touch or go near persons labouring under those

diseases?" Now, if the matter of contagion is very diffusible, and is distributed equally through the room, the house, the street, the city in which a patient is lodged, no one living in the house, street, or city, is much more likely to be infected if he approach the sufferer, than if he remain in absolute solitude, shut up like the grocer of Wood Street in the Plague. The matters which excite influenza and cholera are evidently highly diffusible: in a few days influenza spread all over London; it met you everywhere: nobody, therefore, has attempted to show that medical men, nurses, or others in attendance on the sick, suffered more than other people. If such should ever be the case, either in the influenza or cholera epidemics, it will be in rare circumstances, and should never deter the most timid from discharging their duties to the sick.

'The piety of the ancients,' concludes the Report, 'and of our ancestors, made them consider all plagues the immediate visitations of God's wrath. And there can be no doubt that though, as affecting individuals, there is nothing now judicial in plagues, they are the results of great national violations of the laws by which the Almighty is pleased to govern the universe.'

OUR CORRESPONDENTS.

WE have, at divers times, given the public some idea of the general nature of our correspondence; but as the communications of our friends, notwithstanding the deprecating tone of our remarks, increase every week both in number and variety of character, we think ourselves called on to return to the subject. We are sensible that the brief replies we are able to make through the post to so many letters, can give but little satisfaction to the writers, and likewise that many of the epistolary commentaries we receive are deserving of a better fate than the waste basket. At the same time, the task of answering, even on the most limited scale, is no easy one; nor are we sure that we can, in reason, be expected to devote several hours every day to the consideration of subjects with which personally we have no proper concern. A few specimens of the various communications which reach us will, however, give a more clear insight into the nature of an editor's experiences in this respect than any general observations.

We commence with the class of inquiring correspondents, suppressing only the names of the writers.

'GENTLEMEN—If you can assist me in my inquiries respecting emigration to Texas, I shall feel greatly obliged, either publicly, or by a private answer. The subjects on which I wish to be enlightened, and which I should think are of the greatest importance to emigrants in general, are first, the nature, *geologically, naturally, and socially*, of Texas; its *form of government*, the *security of titles and tenure*, as well as *peace*, the *state of civilisation* it is in, the *relative responsibility* of the government to *protect British emigrants against fraud*; the *climate*, and its concomitant results, with respect to *disease or salubrity, fertility or sterility*, whether subject to *very violent storms or rains*, and for what length of time, or during what *months*; the *ability of procuring labour*, and *price of wages*, with the *customs of the labourers*, their *independence or servility*; the inland roads, means of conveyance, *lodging in the country*, public inns, and other public conveniences; the necessary articles for a family to take out; the length and expense of voyage, and the frequency of communication with England or Europe, &c.; and anything else you may deem necessary for an emigrant to know.

'My reason for troubling you is, that I do not feel disposed to rely on what is either published or put forth in form of prospectus by the parties advertising, knowing that whatever information I gain from your kindness may be fully depended on for the benefit of the industrious and deserving. Awaiting your reply, either personally or through the medium of your valuable Journal, believe me to remain,' &c.

Pretty well this; but it is outdone by the following:—

'DEAR SIRs—Although personally unknown to you, my long acquaintance with your writings almost makes me feel as if I stood in the relation of a friend. I admire above all things the genial character of your publications; and feel that so far from there being any intrusion in this letter, you will thank me for gratifying your well known love of imparting information. I have a few little questions to put to you, which I should be glad if you would answer by return of post. Rather than trouble you with them singly, I have kept a memorandum of them as they suggested themselves, or were suggested by my friends; and I now send them in the lump, that you may have but one trouble in reply, and but one postage to pay.

'First, as to the subject of emigration, I have to inform you that there are several parties in our town who are desirous of trying their fortunes in another quarter of the world, but are deterred by the difficulty they find in obtaining the requisite information. In order to settle the question at once, you will be good enough to state which is the best British colony for the following persons to betake themselves to—namely, a farm-servant; a stable-boy, newly married; five sisters, sempstresses, who decline going separately; a shopman, with his mother, wife, and two daughters; a lad of good, though poor parentage, but who has not been brought up to anything; two hair-dressers; and a sign-painter. Mention also what you think of the United States: and in particularising the various places proper for emigration, do not omit to give some account of the climate, productions, and wages, together with the prices of bread, meat, and beer, and any other little matters that may occur to you. It would likewise be satisfactory if you could mention what stores are requisite for steerage passengers of small means, and what is the best preventive of sea sickness.

'Please to let me know at the same time whether you mean to include Phonography in the new series of "Information for the People;" what progress this system has made in the United Kingdom; and how many adherents you think it has obtained.

'In a volume of the "Annual Register" a few years ago, there was an account of a child born at Bloxley with three heads. Have the kindness to let me know the volume, and also the page; and add what have been the other remarkable instances throughout the world of this kind of *lusus nature*.

'The Greek kingdom of Bactria, founded by the successors of Alexander the Great, has doubtless attracted your attention. It is understood to have been swept away by a horde of Tartars; but it is matter of dispute in our Debating Society here what became of the fragments. Please to let us know the route of the scattered people, and with what nations they incorporated themselves; and copy a few of the inscriptions on ancient coins, and other monuments (if any), that have come to light.

'It is considered here that nightcaps, with an India-rubber band round the edge, to retain them on the head during sleep, would be a great improvement. Have the kindness to let me know whether anything of the kind has been tried; and if not, whether it would be advisable for the party to take out a patent for the invention, what the patent would cost, and the steps requisite for obtaining it. Be minute in all these points, as they are of great interest to a lady who is a warm admirer of the Journal.

'The interest you are well known to take in the rising generation, induces me to ask what course of study you would recommend for boys and girls in general?—whether you are in favour of public or private education?—whether governesses should be permitted to dine with the family when there is a party?—and what is the comparative cost of education in the various universities here and on the continent?

To such letters as these, which we are receiving

daily, we can only reply by stating our total inability to answer the inquiries put to us; indeed to attempt to do so would occupy our whole time, to the neglect of our duties to the public. On the subject of emigration, which is a fertile theme of inquiry, we beg to state here once for all, that we decline offering any private or special advice. With the most anxious desire to befriend those who stand in need of information, we shrink from the responsibility of inducing any man to leave his home, whatever may be the general chances in his favour.

The next class of correspondents deserving notice are those who think they have cause to find fault with blunders into which we unhappily fall. The following is a specimen:—

'I have read the Journal from its commencement, sixteen years ago, and must do you the justice to say that I have discovered fewer errors in it than in any other miscellaneous work. This, however, is the very reason why your friends should be watchful, and never fail to rap you over the knuckles when you do go astray. You have lately committed two egregious blunders, which I take the liberty of pointing out, in the hope that for the future you will pay more attention to what you are about.

'A certain number of years ago you printed a translation called "Life's Value," and now we have another called "The Value of Life"—both from the same original! This is unpardonable. Do you expect the public to pay twice over even the sixth or seventh part of three-halfpence? Or have you perpetrated this blunder intentionally, for the sake of a miserable pun—that you might reply to the complaint of your readers, that you had done nothing worse than double to them the Value of Life? Have done with this trash! Your true excuse is inadvertence. You may plead in mitigation that this is the sole error of the kind in sixteen years—the only instance of twins among the many thousand articles that have seen the light within the space. That's your ticket.

'The second blunder is still more nauseous. In an article on "Mottoes," you not only misquote Lord Eldon's famous motto, but you mistranslate your own misquotation! As it is obvious that you cannot plead ignorance of the learned languages, what is it you do plead? I know that in almost every volume that is printed, we see a list of errata quite as incomprehensible; but where is *your* confession? I observe no acknowledgment of error in subsequent numbers, and the fault, therefore, is aggravated by impotence.'

Our correspondent states nothing but the truth when he thus points out the errors in question. The only thing on which we would remonstrate is his want of temper. A very little consideration might have shown that we could have had no motive in committing these blunders. As to the tale, 'The Value of Life,' it is a different translation from 'Life's Value;' and was accepted, paid for, and inserted, without recollecting that another translation, by a different writer, had appeared seven years previously; and we can only now express our regret that such an unfortunate duplication should have occurred. How little does any one know of our anxiety to present varied and original matter, who imputes to us the miserable expedient of voluntarily offering the same articles twice! Our difficulty consists not in finding material, but in choosing from the accumulation before us, which usually amounts to as much as would make up half-a-dozen numbers. As to the second of the errors referred to (the work of a contributor on whose accuracy we had an over-confidence), it was noticed in time for correction only in our second edition.

Along with this class of correspondents may be included those who find fault with our paper and printing, and the binding of our volumes. A gentleman in Glasgow is much displeased because we do not give more margin, though we are not aware that there is any solid ground for complaint in this respect. Persons

who indulge in these maunderings are not aware of what they are asking. At the commencement of our 'Miscellany of Useful and Entertaining Tracts,' a purchaser complained that the sheets were not clipped in the edges. The idea of trimming them had occurred to ourselves, but had been abandoned as impracticable. Such was the vast mass to be cut, that the trimming of each number would have required the work of two men for four weeks, and cost L.7, 4s. To add but a quarter of an inch to the margin of our Journal, would cost L.188 per annum. This is one of the penalties of a large circulation; and we shall mention another, for it will answer several inquiries. We cannot introduce and benefit by advertising sheets in our monthly parts like other magazine proprietors, because a single sheet inserted into our fifty thousand Parts would require 104 reams of paper; and by no possibility could we realise the cost of such a mass from advertisements. Hence 'Chambers's Journal,' with a circulation many times that of any review or magazine, is the only periodical which does not invite advertisements. All we can do is to employ the coloured wrappers for our own or the announcements of others.

The next class we may take up are the mysterious correspondents, of whom in all probability we have not more than our proper share. All editors of periodicals can tell that they frequently receive letters conceived in a strain of meaning so deep, as to be quite unintelligible. It may perhaps be faintly gathered that they refer to some new view of the planetary system, something connected with man's immortal destiny, or some perfectly original project for sailing vessels with stem or stern indifferently foremost. These letters are not a sham—their writers are in earnest; and as an evidence of their sincerity, they occasionally accompany their epistles with pamphlets, which they have gone to the expense of printing. It is well known that a large number of books and pamphlets are printed annually in London on subjects incomprehensible to any one but their writers—a jumble of incoherent nonsense—the works, in short, of men who are mad on one idea. The following is a communication from a queer genius of this character:—

'Mankind may be divided into two classes—the good and the bad; and again into two other classes—the happy and unhappy; and yet again into two more—the black and the white: and over all these there is a heaven above, to use the words of an author that shall be nameless. You no doubt already perceive what is the object of this communication; but whether your feelings thereupon are of an enviable or an unenviable nature, I shall not determine. In a certain number of the E—J— (I shall decline specifying of what date), there appeared an article more or less connected with science, whether moral or physical, containing a sentence, near the middle of the said article, being the one to which you observe I wish to draw your serious attention. Now although this sentence involves no offence to religion, morality, or good government, still it has, in my humble opinion, a deficiency—I will not say of what importance. But observe, I speak hypothetically. We are all walking in the dark, and he who affects to see, adds folly to blindness. You alone can give the explanation I demand; and I consider it only just, and proper, and rational, and I may add *philosophical* (without meaning any reference whatever to particular systems), to await the said explanation, before fulminating the rebuke I have in store for you. Leaving you in the meantime to your own reflections, your own conscience, your own terrors, as it may be, I send this communication by a circuitous route, which it will be impossible for you to trace, subscribing to it the following initials—which are not my own—A. B.'

We may now proceed to the juvenile correspondent, of whose communications the following is an average specimen:—

'DEAR SIR—I take the liberty of sending you a poem, which I hope you will be glad to insert in Mr

Chambers's Edinburgh Journal, when you know it is written by a young lady. I am only thirteen on the 10th of next month. I know there are some errors both in the subject and in the spelling; but as it is my *very first* poetical production, I am sure you will look over all faults, and consider it worthy of insertion. The gentleman enclosed is my uncle, and a distinguished D.D.'

The 'gentleman enclosed' certifies that 'the young lady is really only thirteen; that her friends, who move in the first circles, will be delighted to see her poetical works in print; and that in his (the D.D.'s) opinion, the editors can have no possible objection to give them a place.' In plain English, Chambers's Journal is to be a receptacle for nursery rhymes, in order to please those 'who move in the first circles.'

We would pass from requests of this nature to another class of correspondents equally unselfish in their demands. These we may call correspondents-mendicatory. They compose a genera of three species. The first are musical composers in London, who request permission to set verses to music which they see in the Journal. As the request is usually accompanied with some terrible tale of family distress, it is rarely refused. The second cannot be treated so indulgently. They are persons who have taken a fancy to some of the treatises in 'Chambers's Educational Course'—these treatises they admire very much—so much, that they ask permission to turn them into books of question and answer for their own behoof; assuring us at the same time that they are quite certain the transformation into catechisms will not in any respect injure the sale of our productions. Leaving the public to guess at our answer to these civil requests, we come to the third species, of whose communications the following is a sample:—

'DEAR, KIND SIRs—I am a teacher employed by the —, who have been in England two years for the sake of my health. It is my intention to return to —, in the West Indies, in the course of next month, and there resume my labours among the poor children of Africa. Knowing your humane and Christian disposition, as evidenced in your meritorious works (which I have read many a time beyond the Atlantic), I have taken the liberty of asking a favour. It is, to make me a gift of a few of your excellent school books, with a view to the instruction of the negroes, both young and adult. You will be delighted to know that these poor and once oppressed beings show a wonderful aptitude for literary instruction. They are of course very far behind, and even the elder amongst them must be looked upon as children. They are all pleased with books with pictures, and like anything droll. I have seen a whole village kept in amusement for a week with a halfpenny edition of Cock Robin; and for long after, they might be heard singing snatches of that juvenile work. On this account, I ask you to be so kind as let me have some of your books of early lessons, containing wood-engravings. If you could let me have fifty of the "First and Second Book," thirty of the "Simple Lessons," and twenty of the "Rudiments of Knowledge," with, say half-a-dozen of your cheapest "Atlas," it would be conferring not alone a favour on me, but on many poor beings who are now struggling into the light of civilisation, and are crying to their more highly-favoured brethren for help. I am permitted to refer you to —, Liverpool, to whom the packet could be forwarded. Trusting to a favourable reply, &c. 'P.S.—If you could include a selection of the "People's Editions," the favour would be greatly enhanced in value.'

We have, on a former occasion, said something of our literary correspondents, and their distribution throughout the three kingdoms; and we have now only to notice, as an indication of the course taken by education, the surprising increase in the number of translators. A day rarely passes without bringing us several offers of translations from the French and German, but more especially the former; and we have thus the constantly-recurring

task of rejecting services, sometimes eagerly offered, and often by apparently amiable and accomplished persons. The circumstance, however, although productive of trouble, and occasionally of painful feeling to us individually, is one of good promise. It is obvious that in this country we are rapidly establishing an intellectual inter-communion with the two most literary nations of the continent; with whom we may thus be said to be exchanging hostages for the preservation of peace and mutual respect and good-will.

'I AM IN THE WORLD ALONE.'

LITTLE child!—I once was fondled as tenderly as you:
My silken ringlets tended, and mine eyes called lovely blue;
And sweet old songs were chanted at eve beside my bed,
Where angel guardians hovering their blessed influence shed.
I heard the sheep-bell tinkle around the lonely shelling,
As the solemn shades of night o'er heather hills were stealing:
The music of the waterfall, in drowsy murmurs flowing,
Lulled me in half-waking dreams—bright fantasies bestowing.
My nursing ones to Heaven are gone—
'And I am in the world alone.'

Fair girl!—I had companions, and playmates kind and good,
And on the mossy knolls we played, where ivied ruins stood;
The mountain-ash adorned us oft, with coral berries rare,
While clear rejoicing streams we sought, to make our tiring there;
And on the turret's mouldering edge, as dames of high degree,
We sat enthroned in mimic state of bygone chivalry:
Or at the mystic twilight hour, within those arches gray,
We told each other wild sad tales of times long past away.
My early playmates all are flown—
'And I am in the world alone.'

Gentle woman!—I was deemed as beautiful as you;
My silken ringlets fondled, and mine eyes called love's own blue;
And then my step was bounding, and my laugh was full of mirth,
Ah! I never thought of Heaven, for my treasure was on earth:
But now my cheek is sunken, and mine eyes have lost their light—
The sunny hours have faded in a long and rayless night;
Not rayless—no!—for angels still their blessed influence shed,
And still the dreams of peace and love revisit oft my bed.
Of earthly treasures I have none—
'And I am in the world alone.'

C. A. M. W.

HOW TO PUNISH THOSE WHO INJURE YOU.

Addin Ballou tells the following anecdote:—'A worthy old coloured woman, in the city of New York, was one day walking along the street quietly smoking her pipe. A jovial sailor, rendered a little mischievous by liquor, came sawing down, and when opposite the old woman, saucily pushed her aside, and with a pass of his hand knocked the pipe out of her mouth. He then halted to hear her fret at his trick, and enjoy a laugh at her expense. But what was his astonishment when she meekly picked up the pieces of her broken pipe, without the least resentment in her manner; and giving him a dignified look of mingled sorrow, kindness, and pity, said, "God forgive you, my son, as I do!" It touched a tender chord in the heart of the rude tar. He felt ashamed, condemned, and repentant. The tear started in his eye: he must make reparation. He heartily confessed his error; and thrusting both hands into his full pockets of change, forced the contents upon her, exclaiming, "God bless you, kind mother; I'll never do so again!"—*American paper.*

SCIENCE OF THE PRESENT DAY.

The characteristic peculiarity of the science of the present day is its delight in details. A mass of pebbles are collected together—each one, perhaps, being cursorily examined and named—but they remain useless lumber, by which the highway of science is obstructed; whereas by the exercise of industrious thought, and by enlarged views, they might have been moulded to a form at once beautiful, as illustrating nature's design, and useful, as facilitating the further progress of man.—*Pharmaceutical Times.*

ARTICLE LITERATURE.

BY LEITCH RITCHIE.

AMONG the radical changes that have taken place in the present century, there is a change in the body of our literature which, strange to say, has been little if at all noticed by the generation whom it concerns. The 'miscellanæa,' 'fugitive pieces,' 'occasional poems,' and 'papers' which our ancestors regarded as a mere make-weight, now fill unnumbered volumes. Of the making of many books there may be no end, but there is assuredly an end of the reading of them: their day has gone pretty nearly by, and the present is the age of ARTICLES.

It is a pity that a better word was not chosen to designate what may almost be called a new literature. An 'article' means properly a clause, a part of a whole—a thing incomplete in itself; whereas the brief pieces alluded to, whether in prose or verse, have an entireness, working out a single conception, and are scattered over with thoughts all tending to a single end. An article is not a chapter, or a canto, but a complete work. It stands upon its own legs; it bears its own charges; and like many brevities in the human species, it has a sense of dignity out of all proportion to its deficiency in inches.

The supremacy of articles may be dated from the era when men, tired of perplexing themselves with philosophical questions, and cutting off heads as a solution, set fairly to work to spin cotton, make railways, build steam-boats, and change the whole face of the world. Immersed in such occupations, they had no time for books; and perhaps too (for I will do justice between the two kinds of literature) they lost the taste for study. This preference, however, of the brief, pointed, off-hand article, is rarely a question of taste. It is a mere affair of time. In the hurry of life, comparatively few are able to grapple with a continuous work. Men of business are too much disturbed by anxious thoughts to reunite with any satisfaction the broken thread of study; and persons engaged in laborious and long-continued employments have neither the energy nor the leisure to give up their faculties to what resembles a task. It is a mistake to suppose that the brief papers in such works as the one in which I am now writing, circulate widely merely because they are cheap: they do so because they are constructed on a principle which is applicable to human nature in all ranks of society. If the rich read more books than the poor, it is simply because they have more time; but, generally speaking, the same preference for short articles is found in both classes. This is what keeps the high-priced magazines alive; and this is what introduces the low-priced journals to the 'best company.' Extreme cheapness, however, is in one grade of society as repulsive as extreme dearness in another; and we are only verging by degrees towards that point in civilisation when the quality of the literature will

be estimated without reference to the circumstance of price.

But articles are not preferred merely because the age is practical; for they are themselves born of the practical spirit of the age. They are condensations of thought and knowledge; they have a terseness of style which would be fatiguing in a larger work; they avoid superfluities, and not unfrequently sacrifice elegance to utility. It may seem paradoxical to say that this popular department of literature is the most difficult; yet such is the fact. There are more bad articles, even in proportion to number, than bad books, and it requires a master-mind to fulfil all the conditions of the former. He who would write a good article, must unlearn as well as learn; he must have the idea constantly before him, that he is not meandering through the ample pages of a volume; he must recollect that 'brevity' is not less the soul of wit than the soul of articles.

I have some suspicion that the number of book-readers (for I do not affect to deny that there are still a few) is smaller than is usually supposed. Take any country town of moderate population, and on inquiring into the facilities for such study, you will find that these are pretty nearly confined to a small circulating library, or the works of a reading club. In some towns of considerable size, more especially in Ireland, there is no such thing as even a circulating library; and the family supply of books, in ordinary houses, in all the three kingdoms, is not only very scanty, but appears to have descended as an heirloom for more than one generation. The custom of individuals buying books, appears to have gone almost completely out; and generally speaking, the publishers who still persevere in the old system of business, make their calculations solely with reference to the book-clubs and circulating libraries. The comparatively small number of wealthy families who furnish their book-room, just as they do any other part of their house, has little effect upon trade, and still less, I fear, upon the circulation of knowledge. The classics of the language are more talked of than read; and as a proof of this, if you will examine, in such depositories, the works of the canonised names, you will be surprised at their state of preservation! This is far from being an agreeable condition of things. It shows both a decline of capital and a decline of taste, and it would imply some want of depth in the existing literature of the country. Articles are read for information: he who would acquire knowledge, must read books.

But the limited circulation of books is compensated, and more than compensated in quantity, by the extraordinary increase of articles. No man in our day, who can read at all, is so poor as to be in intellectual destitution. The most ignorant among us is a philosopher, the rudest a sentimentalist, when compared with his grandfather. The knowledge thus disseminated may be,

or rather must be, wanting in depth; but it is knowledge for all that; and the papers that contain it are the winged seeds, light as a feather, that, floated here and there on the unconscious winds, are destined to cover the earth with a glorious vegetation.

Articles (and I now consider them generally, whether occurring in books or otherwise) are of more value than as vehicles either of mere information or mere entertainment. They have a *personal* character which is necessarily wanting in more elaborate productions, and they thus serve as links to interlace and bind together the sympathies of men. In a book, an author loses his own identity in the subject—he does not dare, as it were, to fill so important a space with himself; while in a few stanzas, or a few pages, he is upon less ceremony, and has no scruple in occupying the trifling area with his own feelings as well as his own opinions. Almost all brief poetical pieces are full of this individuality; and even in short tales and essays, the author is usually seen, in his moral being, through the thin coverings of fiction or philosophy.

This may be one reason, independently of other considerations, why such pieces possess so great a charm for ordinary minds. But let not the author fancy, in his fond simplicity, that he is *himself* the object of the readers' interest. He is only known to them in his sentiments. He is an ideal being, as unsubstantial and as fleeting as the creations of his fancy, and he vanishes as suddenly. The article has done its work when it is read. It has laid impressions—perhaps enduring ones—upon the mind; it has suggested thought; it has opened out vistas for the imagination; and is then, when its fruit is gathered, thrown away and forgotten. Perhaps we may think for a moment that we should like to know the writer who has touched a chord of sympathy in our hearts; perhaps we may amuse ourselves with piecing together an image from the fragments of memory, so as to identify his features with those of the loved and lost; but presently the colours fade, the phantom flies, and, hurried on in the ceaseless round of our ever-busy existence, we plunge into new dreams, as fragile and as brief.

Although the article, however, has so short an existence, it is full of dignity and importance in its connection with the system of which it constitutes a part. That system embraces the intellectual world. It forms a perpetual correspondence of mind with mind, of heart with heart. Its business is not only to inform, or amuse, but to refine and humanise, to draw closer together the sympathies and affections of men. This will be obvious if we only call to mind the effect which these 'unconsidered trifles' have had upon ourselves. How often, in reading some page of the kind, which had possibly no other merit than that of suggesting a train of thought to be followed out in our mind—how often have we felt our heart soften, and our eyes grow moist! It has snatched us away from the present world of care, and we walk again with the phantoms of other years, and dream once more the dreams of our haunted youth; and when we awake, it is neither with a start nor a shudder we look around, but with a subdued temper and a chastened spirit, as if the past reacted upon the present, imparting to it a mellowness of hue which is otherwise seen only through the mists of time. Again, how often have we been roused by similar means from apathy, and almost despair! How often have we felt a thrill run through our inner being, awaking our dormant energies, and stirring up our fainting courage, as if with the sound of a trumpet! For my part, I care not to conceal that, in passing through a life of perhaps more than ordinary vicissitude, I have frequently derived from these hasty and laconic monitors a

fortitude that was not my own. I have been nerved to endurance, and incited to perseverance; and as I read, I have felt a warm sunny light breaking anew upon crushed feelings and withered hopes.

I have likened this system to a universal correspondence; and I would have it understood that not one letter fails of reaching its address. Every mind has its like. It belongs to a class, possessing a common calibre, a common standard, and a common language. Within this sphere the article appertaining to it circulates, because it is therein felt and understood, although in other spheres it may be too high for apprehension, or too low for notice. Nothing is written in vain. The volume that is said to drop still-born from the press does its work like the rest. A few copies see the light, and a few kindred minds—were it only those of the trunk-maker or the buttermilk—attest, however unconsciously, its power.

If such is the influence of literature—and the fact will be denied by no thinking person—the moral responsibility that devolves upon authors must be great indeed. It matters not what the piece may be—whether designed for entertainment or instruction, or whether a mere vagary of the fancy—it has still its effect upon some minds, whether few or many, and must therefore assist or retard *pro tanto* the progress of the race. Brief pieces more especially, being usually indications of personal character, should be carefully written, from policy, if from no higher motive. It is vain, for instance, for a man to declaim against public war, who incites class against class, and sows dissension among those parts of society on whose union the safety of the structure depends. It is vain for the moralist to preach against the poison of intoxicating liquors, who disseminates the worse poison of uncharitableness. Without consistency and coherence, we can do nothing. Our guiding principle must be a love of mankind in the aggregate—a devout faith in human nature—for this involves true charity and true liberality; and in the end, as refinement and civilisation advance, it will triumph over the clamour of sects and parties.

Before concluding these desultory remarks, I may be permitted to advert to a most gratifying characteristic of the article literature of the day. I do not confine my observation to what are called tracts—short papers designed for spiritual admonition—or to the essays which circulate as usual among the different denominations of the Christian world; but there appears to me to pervade the respectable portion generally of this department of our literature a deeper and more catholic feeling of religion than has hitherto been manifested in a popular form. But how, indeed, could it be otherwise! The more general the diffusion of letters, the more firmly fixed must be the idea of Spirit. In the last century, when the human mind was in preparation for a mighty political revolution, the comparatively small number of authors were the priests of the people, and, like many an older priesthood, their aim was to confine the popular worship to themselves. This hierarchy is now at an end, and the gates of the temple are thrown wide open. We are all priests, and prophets, and soothsayers. We are all interpreters of the mystic whispers that run through the eternal aisles. Spirits ourselves, we commune with spirits. Imprisoned no longer within the external crust of nature, we *know* that there is something beyond; we read the fact in the 'starry scriptures of the sky;' and hear, as of old, the voice of the Lord God among the trees.

The religious feeling I allude to is not obtrusive, not sectarian, not controversial: it is simply a feeling—an inward conviction, conscious or unconscious—which must

spread and deepen with the progress of enlightenment, beautifying and ennobling the whole system of our literature. If confined to books, its influence would be slow and limited; but imbuing, as it already does to some extent, the articles which are the intellectual pabulum of the masses of the people, it must advance, in defiance of all obstacles, with the steadiness of the ocean tide,

'Which rolled not back when Canute gave command.'

'THE RETURN OF ZEPHYR.'

In the month of January 1808, Jules Morisseau made his first appearance as a dancer on the boards of the Imperial Theatre of Paris. He was the best pupil of the dancing-class of M. Gardel the ballet-master; one of first-rate promise, uniting grace with strength, and suppleness with vigour. At that time two celebrated dancers reigned supreme over the kingdom of Terpsichore—Vestris, and young Duport, his equal, if not superior. These were dangerous rivals. Gardel, however, encouraged his favourite pupil, reminding him that he was twenty years younger than Vestris, and six younger than Duport, while he united the qualities of both these dancers. 'Every star,' he repeated, 'must shine in its turn: youth is the greatest merit in a dancer, especially when he can *pinouette* and bend as you do. Courage, my child, you have a fine figure, and use your arms with grace.'

Fortified by such eulogiums, young Morisseau made his debut without fear. To mark his gratitude to his master, he chose for his first appearance the 'Return of Zephyr,' a ballet of which M. Gardel was the author.

Morisseau, attired in a flesh-coloured web, covered by a short tunic of gauze, and two butterfly wings on his back, bounded from the side-scenes, and flew over the stage with all the lightness of a Zephyr, which gently touches, but bends nought beneath its weight. The public, accustomed as they were to the wonders of dance by Duport, did not the less acknowledge the talents of the new candidate for their favour, and Morisseau was received with thunders of applause.

The next day he went to thank his master, and to learn from him his future prospects. To appear at a theatre is nothing—a regular engagement is necessary. Gardel received his pupil with extreme coldness; no longer like the master of the day before, but now a severe judge, a rigorous ballet-master, one of the sovereign arbiters of Morisseau's fate. Even at the theatre diplomacy has its place: everything is calculated, everything is foreseen, and every actor knows the credit and the power of his comrades. Gardel was secretly flattered at his pupil's success; but this success had disturbed all the dancers of the opera, and the prudent ballet-master did not wish to make enemies.

'The public, I think, were satisfied,' said Morisseau on noticing the sullen countenance of the professor; 'and you, Monsieur Gardel?'

'The public have nothing to say in the matter, sir,' replied Gardel. 'The question now rests with the first dancers of his majesty the emperor's theatre, which is quite another affair. Monsieur Vestris thinks you fail in precision.'

'That reproach must fall on you, Monsieur Gardel, and you well know its injustice.'

'That's true, *mon ami*—that's very true; but nevertheless it is Monsieur Vestris's opinion. Monsieur Duport says you are too tall.'

'We are just the same height,' replied Morisseau.

'Very likely. In short, my good friend, Chevigny, Semblier, Milliére, and Clothilde, declare they will not dance with you.'

'In what manner have I been so unfortunate as to displease these ladies?' asked Morisseau, who felt assured he was handsome enough to find favour in their eyes. 'Do they think me deficient in talent?'

'No, not at all! These ladies have too good taste not to appreciate my best pupil. It is the men whom you displease. You have too much talent, my good

fellow. You must give up all hope of being engaged at the Opera: the thing cannot be done.'

After this strange avowal, Gardel felt anxious to apply a balm to the wound he had made.

'I have a superb engagement to offer you,' said he.

'Let me hear it,' replied the young man despondingly.

'A magnificent engagement—to dance on the banks of the Tiber!'

'The Tiber! What is the Tiber?' asked Morisseau, who was as learned as most dancers are.

'When I say the Tiber, my dear fellow, I mean Rome—the capital of the arts, the country of the ancient Romans. Rome, which has been conquered by the Emperor, where they act French plays, where they perform French ballets—the "Return of Zephyr," for example! My dear Morisseau, you will be the first dancer in Rome, at the theatre Argentina. That is something. The Romans have excellent singers, but bad dancers; if Apollo has remained in Italy, Terpsichore has taken refuge in France! Go, my friend—go show the country of the Cæsars what a dancer really is—four thousand francs a year, and your journey there and back free.'

In those days actors were paid much less than at present. Duport himself had not more than six thousand francs a year at the Opera. Gardel, therefore, offered a large salary to his *élève*, which ought to have been a temptation to one who had no other fortune. The actors, however, of that time were of less roving dispositions than now-a-days, and it was difficult to make them believe it possible that a fortune could be made anywhere out of Paris: the dancers especially imagined there were no Zephyrs except at the *Grand Opéra*. Besides, Morisseau was a gentle youth, timid, but irritable, and one whom a word could frighten. A journey to a foreign country, of whose language he was ignorant, consequently startled him. Gardel thoroughly understood the habits and ideas of the dancing community, and anticipated all Morisseau's objections before he had time to mention them.

Gardel's arguments carried the point. Morisseau signed the engagement, and set about making preparations for his departure. A dancer's wardrobe is not very heavy—five or six web-suits, some yards of gauze, and a dozen of dancing-socks, completed Morisseau's outfit; and he set out on his journey, taking care to make pirouettes and battements in the hotels where he stopped, in order not to lose in agility or grace. He arrived at Rome light as a feather, and bounded rather than walked on the land of Romulus! Without troubling himself in the least about the Coliseum, or Trajan's Pillar, he flew to the theatre Argentina, took some Zephyr-like flights on its boards, and then hastened to pay his respects to the first danseuse. La Signora Camilla was a beautiful Italian brunette, with black hair, the delight of the dandies, and the idol of the Roman princes. Morisseau found it as difficult to pronounce one word of Italian, as the signora did to speak one word of French. But all dancers are good at pantomime, and the two artistes ended by understanding each other. The first rehearsal showed Morisseau in what her style consisted. The signora danced with her arms and her eyes, but little with her feet. She had a good ear, but neither talent, lightness, precision, nor art. Morisseau only assisted at a few representations, when he became convinced that the whole ballet was on a par with the first danseuse. Yet these bad dancers were much applauded; from all corners of the theatre was to be heard '*Bravo, bravi, brava!*'

'Very good,' said Morisseau to himself: 'my success is certain. I shall be the first dancer in Rome, as Vestris is at Paris.'

It is proper to mention that at this time Rome was in the occupation of the French, whom, with their leader Napoleon, the Romans cordially detested; and this dislike they took every means of expressing, as far as it was safe for them to do so. Dancers are not politicians; Morisseau was unconscious of the unpopularity

of his countrymen, and he feared no expressions of such a feeling levelled against himself.

The day for his debut at length arrived, and the expectations of Morisseau were not disappointed. His graceful and correct dancing produced an immense effect: he surprised and astonished the spectators. It is true that many of the audience were French; however, the Romans, in spite of themselves, were highly gratified, and applauded him with enthusiasm. Of late years the ballet has made great progress in Italy. In 1808, a good dancer was nowhere to be found there, and Morisseau appeared before them as the first symptom of the revival of this long-neglected art. The Romans crowded the theatre to admire the lightness of this Zephyr, who seemed to fly from one side of the stage to the other, as if he touched the earth only through complaisance. The extraordinary entrechats, and the suppleness of the dancer, surprised them, while they loudly applauded the man who gave new excitement to their pleasure. Morisseau redoubled his efforts to merit this approbation; and yet, by degrees, the 'bravuras' became less enthusiastic, and the concourse of spectators gradually diminished. The pleasure which dancing gives charms only the eye, but says nothing to the mind. Morisseau's companions, too, had a great advantage over him; though bad dancers, they excelled in pantomime. In a heroic ballet they were below mediocrity, but in comic performances they were first-rate. Harlequins, Burchiellis, Pantomimes, and Polichinellos, were played by them in perfection. Even Signora Camilla herself, badly as she represented an attendant of Flora, was an admirable Columbine. The countenances of these Italian dancers, full of animation and vivacity, expressed at will all those comic passions which for centuries have so much amused the Roman people. Morisseau, on the contrary, could put no expression but in his feet! A perpetual smile reigned on the lips of this Parisian Zephyr.

Morisseau's happiness was not destined to last. His first cause of disquietude was an attachment which he formed to Signora Camilla, little as he thought of her dancing. The poor Zephyr—and may not a 'Zephyr' have feelings like everybody else?—did not know what a storm was brooding over his head. His attentions to Camilla roused the indignation of a rival, and he learned with horror from the 'Pantalon' of the company that a design was formed to assassinate him. After this dire intelligence, Morisseau never left the theatre without being armed with a pair of pistols. He no longer ventured to look at the Signora Camilla. In the 'Return of Zephyr,' his flight across the stage was no longer performed with that ease of mind which gave such lightness to his every movement.

Another bitter grievance was preparing for the Zephyr. One night, on making the very first light-footed bound which brought him in face of the audience, he heard an ill-suppressed titter in boxes and gallery.

'Bravo! Calzetti! Bravo! bravissimo!' was echoed from all sides. 'Bravo! that's it exactly!'

Morisseau understood neither the laughter nor the bravos, which evidently were not intended for him. Not speaking one word of Italian, and addressing persons who understood him badly, or did not wish to answer him, he was persecuted by this name—Calzetti!—without being able to find out its meaning. If he asked his friend the Pantalon, the treacherous dancer shrugged his shoulders, and turned his back: if he overcame his fear, and ventured to question the Signora Camilla about this invisible enemy, she looked at him in astonishment.

'Calzetti!' said she; 'Calzetti!'—opened her beautiful lips, displayed her fine teeth, and made the scenes resound with her boisterous laughter.

Melancholy, dispirited, and wounded in his self-love and his love of the signora, Morisseau absented himself as much as possible from the theatre and the *corps de ballet*. He wandered through the streets of Rome, and passed by the magnificent palaces, the fountains and

columns, indifferent alike to their history and beauty. The classic beauties of Rome were in his eyes inferior to the decorations of the Opera-house in Paris. His master, M. Gardel, had spoken to him of the 'banks of the Tiber.' Morisseau determined to see the Tiber; but its yellow waters said nothing to his imagination. Like the children of Jerusalem at Babylon, he sat on the banks of the river, and wept as he thought of the flowery meadows watered by the Seine. One day he was walking with his usual indifference down the Corso, the rendezvous of all the idlers of Rome, when, perceiving his dreaded rival at a distance, he turned off quickly to avoid him, and found himself before the Palazzo Fiano. From an entrance to a cellar or vault, of uninviting appearance, rose up an Italian head—a head with brown curly locks, and eyes like coals of fire. 'Enter, signor; enter,' cried the Italian.

Morisseau stopped and stared at the man.

The Italian perceiving this hesitation, added, 'Signor Francese, enter! A comedy, an opera, a ballet! It is il Signor Calzetti who invites you.'

At the name of Calzetti Morisseau started back; but the crowd pressing on to the Palazzo Fiano, carried him forward. He descended a few steps, threw a piece of money to an old woman who was sitting at the counter of this strange theatre, which he now discovered was a puppet-show. The audience was numerous and select; for the simple reason, that the Romans seek with avidity every description of pleasure, no matter under what shape, and the puppets of Signor Calzetti were very amusing.

Morisseau seated himself in the pit: just above him hung the chandelier which lighted up the salle. He now saw before him a little theatre, five or six feet high by twelve broad; a crimson curtain, trimmed with gold fringe, hung before it. The overture was played; the director gave the three knocks, and the curtain roe. The stage represented a pretty saloon; a door at the far end opened, and a young cavalier appeared, who with much grace gave an explanation of the piece in which he was himself to act a principal part. The lover was succeeded by the beloved one, then by the soubrette (waiting-maid), the valet, and the noble father. All the actors were about twelve inches high; they were suspended by invisible wires, and moved by other wires concealed under the boards of the stage. These were the puppets, or rather the *fantoccini*, of the 'illustrious Signor Calzetti!' The play terminated amidst the laughter of the audience: after the play came the opera. Male and female singers, concealed behind the scenes, made the puppets sing with taste and brilliancy. Morisseau stared, and not understanding Italian, he scarcely appreciated the merit of these performances. At length they announced the ballet; this touched him especially, and he now redoubled his attention.

'Can you tell me,' said he, addressing himself to his neighbour, whom he had recognised as a Frenchman, 'what the name of the ballet is which they are going to perform?'

'With pleasure,' he replied. 'I must first explain to you, my dear sir, that this ballet is a parody. At the theatre Argentina they have been dancing a new ballet!'

'The "Return of Zephyr!"' said Morisseau.

'The very same. A dancer from Paris has been engaged to perform in this ballet, and the Romans began by applauding, because the young man really dances very well; but!'

Morisseau was about to exclaim, 'I am that young man!' when this 'but' stopped the words on his lips. His neighbour continued—'But Signor Calzetti, cleverer than all the professors of Paris, has supplied them with a far superior pupil to this Morisseau.'

'Far superior!' said Morisseau with horror.

'You will soon be able to judge for yourself.'

'Monsieur Calzetti! Monsieur Calzetti!' said Morisseau again; 'Monsieur Calzetti is a man!'

'Is a man of talent,' responded his neighbour. 'His pupils are faultless; his Zephyrs are of an astonishing lightness; and his dancers do not touch the ground. You shall see!'

Morisseau was confounded; his head was on fire, and yet he trembled all over: his mind, not one of the most brilliant, did not perfectly comprehend the mechanism by which Signor Calzetti's 'fantoccini' were moved; and his artistic vanity was irritated at hearing himself pronounced inferior to a puppet.

'Attend now,' said his neighbour; 'the ballet is about to commence.'

The curtain rose; the theatre represented a landscape of flowers, with myrtles and rose-trees in full blossom gracefully filling up the sides. On a sudden the foliage became agitated, the roses trembled on their flexible branches—Zephyr appeared. One might have imagined that he descended from a cloud towards the earth: he did not touch the boards. What a Zephyr! He passed through the midst of the flowers; he caressed them by his looks; he flew all round them, gently moving his wings, like the bee who, seeking the best hooded flower whereon to fix himself, stops for an instant in his flight to admire the rose before he extracts its perfume. It was no dancer, it was a winged god—swifter than Iris, lighter than Mercury. He went—he came: from the flowers he flew towards the nymphs, who escaped into the groves: from them he returned to the flowers. In the movements of this little aerial figure there was so much suppleness, so much grace, and, above all, so much truth, that this work of Signor Calzetti realised the imaginary creations of the poets. Zephyr had descended from Olympus to caress the flowers, and Signor Calzetti had accomplished the difficult art of feigning life and action with a surprising perfection. The enchanted Romans applauded with so much the more vehemence that they knew the amusement they were enjoying would not last long. Zephyr at length, after having coquetted with the nymphs, and made the leaves of all the trees tremble, took flight, and was lost in the clouds, returning to that Olympus from whence he probably came.

'That is Zephyr!' said Morisseau's neighbour; 'that is the light god, the messenger of Flora! Now you will see the parody.'

The tops of the trees became immovable, the flowers no longer shook on their trembling stalks; nothing stirred. By a stream of light scientifically arranged, the perspective of the scenery was destroyed, just as at the Opera. Zephyr appeared, not in the horizontal position of a flying aerial spirit, but like a human being whom the laws of nature compel to preserve his centre of gravity. The criticism was unjust, but the contrast was amusing.

'Morisseau! Morisseau!' was shouted on all sides; and an immense burst of laughter echoed through the theatre. Morisseau, the Zephyr, or, if you wish, the puppet of Signor Calzetti, placed himself in the middle of the stage, raised one leg, and commenced one of those interminable pirouettes in which French dancers too frequently indulge; then stopping suddenly, the little puppet, rising from the stage, commenced an *entrechat*, not of eight, but of sixteen—ay, thirty-two cuts—an eternal *entrechat*, performed with such vigour, that the noise of his heels, when meeting together, could be distinctly heard. After this exploit, Zephyr came down again on the boards, sighing forth an 'Ah!' that went to prove his fatigue and loss of breath.

'Eccolo il Zephro Francese!' ('There is the French Zephyr!') cried out the perfidious Calzetti from behind the scenes.

The laughter and the stamping of feet recommenced with greater noise than ever; and Morisseau, transfixed to his place, bent down his head, and peered anxiously around, fearing to be recognised by the spectators. The Romans dared not resist the French authorities; they bowed their necks before the idol image of the Emperor. But the hatred of the nation had need of

some means of demonstration, and it vented itself on a dancer.

The performance was at length ended, and Morisseau was able to leave this little theatre, where they had hissed him with so much bitterness. Dancers are unaccustomed to criticism; the press has little influence on them, and in 1808 it had none at all. At that period many dancers did not know how to read. The chastisement Morisseau had undergone was as novel to him as it was unexpected. The blow struck him in the most sensitive part, and found him defenceless. He regained the solitary chamber which he occupied near the theatre, and went to bed—not because he was ill—hoping to drown in sleep all recollection of his wrongs. It was about nine o'clock when he returned home. At this hour the Romans leave their houses to saunter through the streets and public squares; for here, as in most warm climates, the people turn night into day. The house in which Morisseau lodged was therefore nearly empty. He had scarcely laid his head on the pillow, when he heard a footstep in the corridor adjoining his room, and in a second after some one knocked at his door.

'Monsieur Morisseau!—Monsieur Morisseau!'

The dancer recognised the voice of the manager of the theatre. He rose, wrapped himself in his dressing-gown, and opened the door.

'How now, Morisseau!—in bed? Are you ill?'

'No, sir, but—'

'No!—that is sufficient: then come with us. Dress yourself, Morisseau, and come to the theatre. The performance is changed, and we have substituted the "Return of Zephyr." Come and dance.'

'Never!—never!' cried Morisseau.

'What!—never? The cardinal chamberlain particularly wished to see the celebrated French dancer; so come at once!'

'I will never dance again at Rome,' said Morisseau sulkily. 'To-morrow morning I start for Paris.'

The manager took an immoderate fit of laughter; and placing his hand on the dancer's shoulder, said slowly, 'Leave for Paris!—you, Morisseau! You are engaged to me for three years: I have your engagement signed by yourself; and as you acknowledge that your health is good, you shall dance this evening—or sleep in prison.'

This was a serious affair, and Morisseau knew it.

Poor Morisseau was forced to dress himself and go. He was obliged to put on the costume of Zephyr, and to fix on his back the little butterfly wings. But the self-reliance of the dancer was gone: he had lost all belief in his talents. The fantoccini of Signor Calzetti had disgusted him with his *entrechats* and his *pirouettes*. He appeared on the stage—he danced—his legs failed him—his head grew dizzy—he made a bound forward, but believed he was falling—his eyes became dazzled, and a thousand visions surrounded and confused him. At his feet, on his head, all around him, he saw flying myriads of Zephyrs, who teased and beset him like so many little spirits. The audience first laughed, then cried at and hooted him; and he heard his name pronounced, coupled with that of Calzetti—'*Morisseau!—Morisseaumasio! e viva Calzetti!*'

Such were the sounds that reached him from all sides. If he looked at the boxes, he saw spectators who seemed to enjoy his torture; if he looked behind the scenes, it was his friend the Pantaloon who was tittering, or the Signora Camilla, who joined heartily in the universal laughter. Distracted, beside himself, frantic with grief and shame, he danced out of time, stopped, and then darted forward: in four bounds he was off the stage, and out of the theatre. He escaped up a staircase which lay before him. The stairs led to a corridor; at the end of the corridor was a window. Meanwhile the audience grew more excited, and cried out loudly for 'Zephyr.' Morisseau's comrades ran after him to bring him back: the wretched man heard them at his heels, and knew they were trying to seize

him: the window at the end of the corridor was open: unfortunate Morisseau made one bound more, and Zephyr fell lifeless on the pavement before the theatre Argentina!

His death caused no small sensation. Rome, a clerical city, holds suicide in horror. Like all events of the kind, no one gave the true explanation. Calzetti was ignorant that the French dancer had seen his own parody, and never imagined he had any share in his death. Signora Camilla, who had favoured his suit, had not to reproach herself with any harshness. A report was drawn up and presented to the governor of Rome, recounting at length the death of Monsieur Morisseau, a French subject, who, during an attack of fever, precipitated himself from a window of the theatre Argentina. No one would have heard more of the event, but for the cruel Signor Calzetti, who made his puppets perform 'The Death and Burial of Zephyr,' which new ballet attracted crowds to the theatre Fiano. The secret hatred of the Romans to the French insured the success of this tasteless performance. But the gay season once past, no one bestowed another thought on unfortunate Morisseau in the city of the Cæsars.

HEAL-ALLS.

THE idea of a panacea or cure for all diseases is one of great antiquity. It falls every now and then into a lull, but seldom fails in a short time to start up again in full vigour, as if the tendency to it were something inseparable from human nature. Considering it rather as a desperate intermittent than a mania, we would say it is at present in one of its cold stages; but we have no doubt that this will pass, and some day ere long we shall be startled with yet another proclamation that at length a true unmistakable universal medicine has been discovered.

It is curious to remark that the real or pretended substratum of the panacea idea is in all cases the same. The pseudo-philosophic mediciner declares, and the intensely ignorant alike believe, that all disease has a common origin, or exhibits a common type. So much being fixed as the starting-point, the rest is done to hand. If typhus fever and hooping-cough, consumption and insanity, or any other incongruous couple we choose to mention, are the products of one course, what is given is to find the remedy for this morbid cause; and the panacea comes in to the rescue with all the authority of a Q. E. D. It would be curious, if it were not too often deplorable, to observe the strength with which a fantastic opinion of this kind holds the mind in its grasp. That which flourished under the auspices of Zeber, the Arabian alchemist, who averred that he was in possession of the elixir of old age, is a cognate idea with a very prevalent error of the nineteenth century. In character, however, with the disposition of the times, this, too, has put on the garments of science. It is at once cloaked and dignified by the terminology of the 'pathies.'

After the reign of Ward's wonder-doing drops in the eighteenth century—the red drops, the white drops, and the essence for the headache—began the reign of tar water. Nor was it much to be wondered at that hogs-heads of this odorous fluid found their way into the stomachs of invalids, when the eloquent Bishop Berkeley* was enlisted on its behalf. Hear this splendid orator on his hobby:—'I freely own that I suspect tar water to be a panacea. And as the old philosopher cried aloud from the house-top to his fellow-citizens, "Educate your children," so, if I had a situation high enough, and a voice loud enough, I would say to all the valetudinarious upon earth, "Drink tar water." Such mighty preaching had its due effect; tar water was in vast requisition for all manner of similar and dissimilar disorders. Rheumatism, phthisis, ulcers, fled at its approach. Yet its brief day soon ended; and with its

learned and fervent patron it descended into the tomb. And the like is the history of countless drops, waters, and elixirs. Carried up into popularity by the ascending swing of the great pendulum of human caprice, and flung down into obscurity as it returned in its oscillations, to bear up some other folly of a day, and to cast it down in like manner.

The history of the galvanic or magnetic panacea—for they are akin in some respects—is sufficiently interesting to deserve a separate notice. To the best of our knowledge, this has come to life about five times. First, many centuries since, under the famous Dioscorides; second, in the seventeenth century; third, in the eighteenth century; fourth, at the early part of our own; and fifth, so recently as two or three years ago. Great medical powers were at an early period attributed to the loadstone. Dioscorides largely used it in practice. Weapons rubbed with it were believed to inflict deadly wounds. The king of Zeilan attached such virtues to it, that he had all his meat served up in dishes of loadstone, conceiving that thereby he preserved the vigour of youth. Aëtius, who lived so early as the year 500, says 'that those who are troubled with the gout in their hands or their feet, or with convulsions, find relief when they hold a magnet in their hands.' It was frequently used as an amulet for the headache. 'Perceiving,' says Sir Thomas Brown, 'its secret power to draw magnetical bodies, men have invented a new attraction to draw out the dolour and pain of any part.' Powdered, it was made into a plaster to extract bullets! The case of a young man is given who swallowed a knife ten inches long, and had it attracted to the surface by a loadstone plaster. At the end of the seventeenth century, says Borrelli, magnetic toothpicks and earpickers were made, and extolled as a secret preventive against pains in the teeth, eyes, and ears. Also for hernial protrusions the patient took iron filings internally, and wore a plaster of powdered loadstone outside! More extravagant ideas still were entertained by some; and tales are told that robbers practised their crimes by its assistance; lighting a fire at the four corners of the dwelling, and flinging a loadstone into the centre of the house. The thought was, that the inhabitants would be repelled out of the house; but whether their precipitate retreat was attributable to the loadstone or to the fire, we leave to the learned to determine. Wounds rubbed with it were said to be at once eased of all pain. The eighteenth century, however, saw magnetism *redoubtous*, and with wonderfully renewed energies. In 1770, a Jesuit named Hehl, a professor of astronomy at Vienna, invented some steel plates of a peculiar description, which he impregnated with magnetic virtues, and applied to the cure of diseases. These discoveries became known to Measner, and were adopted by him. Experiments in Paris were made, and a great noise arose in the world about this 'new' remedy. Again magnetic cures ceased to be spoken of, when, at the commencement of the nineteenth century, Mr Perkins, an American, brought his marvellous discovery to the light. By the use of certain metallic bars, which he entitled 'metallic tractors,' and which he drew over the affected parts, he pretended to the cure of a host of diseases. From America the fame of the 'tractors' spread over to England, and set all Bath in a turmoil. Otherwise intractable diseases fell before the power of these 'tractors,' which had the imposing authority of a patent for their protection. And surely never was any panacea so bestimonialed as Perkinism. It enjoyed the overwhelming authority of eight professors of medicine and natural philosophy. But this was feeble in comparison to the roll of high names which followed, among which were nineteen physicians, seventeen surgeons, ten doctors of divinity, and ten clergymen. Will those who have read our extract from Aëtius above, believe that many grave and sober-minded gentlemen wore pieces of loadstone round the neck for the purpose of preventing or curing the gout! So much has thirteen centuries done to immoderate 'panaceism,' Perkinism

was doomed. One or two physicians poked out the fire by producing equally marvellous cures by tractors made of wood, and painted so as to resemble the metallic. One amusing case occurred in which the patient declared solemnly that the (wooden) tractors had 'tormented him out of one night's rest, and that they should do so no more!' The real nature of these mirific tractors was then exhibited, and Perkinsism received its deathblow. Not so magnetism. A few years ago came out the galvanic rings. It will therefore be fresh in the memory of our readers, that the world again raved after this remedy. Every cabman's finger glimmered with the lustre of the galvanic ring. It was 1690 over again. If we cannot, with Borrelli, speak of magnetic toothpicks, we can of galvanic tobacco-pipes; the galvanism generated in a manner of which philosophy is ignorant, by the passage of the smoke through a coil of wires! What this was intended for, we confess we never could rightly discover. Every man carried his battery on his finger, or wore it on his gout-tortured limbs. A splendid ignorance of the laws of electricity sparkled in golden circles; and minute currents of that fluid, instead of traversing the podagric toe or rheumatic thumb, playfully circled in the ring itself. The bands and rings, the galvanic hair-brushes and gloves, and all the other ingenuities of the delusion, are becoming histories; yet a fantasy which has lived and died five or six times, indicates a tenacity of life which may well cause us to be very careful how we pronounce upon its actual death.

Leaving this instructive history, we may recall to the attention of our readers the case of that impostor of mournful celebrity—St John Long. His theory was, that it is possible to extract the morbid matter which produces disease out of the blood. Surely his remedies were sufficiently extractive: they extracted skin from the muscles, and muscles from the bones. By the use of a corrosive liniment of a mineral acid and turpentine, he blistered only too many of his patients to death. As the history of this charlatanism is quite recent, we need not dwell on the temporary delirium which St John Longism produced—the lines of expectant carriages, the list of noble victims, the flocks of country patients, the coroners' inquests, and the death of the operator of one of the diseases himself pretended to vanquish—all these are the common features of 'panaceaism.' And let the empty street, deserted room, and tenanted grave, supply the usual tailpiece to the history. External friction was another popular panacea, under the more captivating title of 'shampooing.' It had the usual symptoms of the disease. It was to cure every 'ill that flesh is heir to.' It had its crowds of votaries; and the shampooer, an ignorant mechanic, for some years cleared five or six thousand pounds annually! If one could say, 'I likes to be despised,' with how much greater truth might it be said of these that they loved to be deluded. On one bad case of incurable paralysis, the parents of a young lady spent four or five hundred pounds in one year! Some of the great ones, we rather believe of the medical profession, having recommended mustard-seed for dyspepsia, then followed the days of this remedy; and no one can tell to what an extent it was devoured by the seekers after health. Folly and fashion took up their plaything, dandled it, and flung it away for brandy and salt. We forget just now how many treatises came out upon brandy and salt; and we are equally forgetful of how many thousands were cured of bodily ills inside and out. Probably no ordinary figures would have power to represent the last, when we are assured that one gentleman, the inventor, gave away a hogshead of brandy, and salt without weight, in this cause. It was the grand *arcum* of an hour. But 'Morisonianism' has had a longer sway, though it, too, is on its last legs. There is a painful similarity between it and St John Longism when at its height of glory. Infatuated patients dozed themselves to death: one is said to have died in the faith, actually swallowing the medicine just before expiring. The

thirty-five or forty pill dose-days are happily gone by: common sense has done its work; but we fly to the opposite extreme in homoeopathy. This was not so much a panacea as a panaceal system: and now came the era of millionths, billionths, and trillionths; and doses were administered in proportions which the human mind is unable even to conceive of. Thus are we conducted to the freshest of all—hydropathy; the system which washes out disorders from the human frame; which has enriched a Swiss peasant of rugged outside and more rugged interior; which has turned the pharmacopoeia into water; which has clothed fashion and fancy, not in silk attire, but in wet sheets; has turned wine into water, and the drawing-room into a cold bath; which, we regret to add—though doing some good as respects temperance, exercise, and cleanliness—has turned slight diseases into dropsies.

Now we may, before concluding, just make the remark, that even among the ranks of the medical profession the spirit of popular panaceaism, in a mitigated degree, only too frequently carries away sound judgment. One, for instance, in the cobbler's spirit, will have it that there is nothing like prussic acid; another doses us with camphor; a third with opium and quinine; and calomel, creosote, mineral acids, iodine, have their respective votaries. Yet we must not be misunderstood either in this or in the former case. We do not deny that there is good in all these, even in Long's liniment, or galvanic rings properly applied and constructed. Many of these panaceas are only the exaggerations of some particular benefit residing in the extolled substance or system. Such, however, is the tendency of the human mind—ever credulous of, and anxious to idolise an impossibility. Lady Mary Wortley Montagu shrewdly observes, 'We have no longer faith in miracles and relics, and therefore with the same fury run after receipts and physicians.' Yet we cannot close our article without expressing our utter abhorrence of that cunningness of covetousness which, itself unbelieving its assertions, enriches itself at the expense of that funded principle of faith planted in the mind for the noblest ends by the Divine Author; and though we attach much blame to the deceived, we would heap infinitely the most upon the impostor, who in so many cases has gathered his riches out of falsehood.

SPARE MONEY.

THERE is something afflicting in the way in which superfluous wealth is used by its possessors. Many men know how to gain money: comparatively few know how to spend it. Some think they do well if they bestow it on luxuries, as it thereby gives employment and bread to artisans and tradesmen; not having yet mastered the doctrine in political economy, that artisans and tradesmen can as well be employed in producing real as imaginary comforts, as far as their own interests are concerned, and that therefore to give them money for what is not enjoyable, is to throw money away. Others hoard, under the frenzied fears of the miser, for a poverty which has no chance of overtaking them, or for the sake of the glory and power of wealth, or to endow heirs with that which they may misuse. How seldom do we hear of a man possessed of means far above his own present or contingent necessities, having the heart or the sense to use them during his lifetime in a way that may redound to the benefit of his less fortunate fellow-creatures! It is not uncommon, indeed, to leave wealth, when it must be left, to endow some benevolent institution, which may be a monument and a posthumous flattery to the testator. But this is very different from the rationality of using wealth in one's own lifetime for similar professed objects.

The condition of endowed charitable institutions

generally, is not that which can offer any pleasing prospect to persons who think of leaving money for such purposes. According to investigations made a few years ago, the larger proportion of all the public charities in England are either dilapidated by mismanagement, or their funds are altogether absorbed by trustees. It was hoped that the announcement of this startling fact would have led to some kind of provision for placing endowments under the inspection of a public officer; but like many other abuses, the subject went to sleep; and up to the present day, nothing, we believe, has been done to insure the proper administration of endowments according to the will of the testators.

Intending endowers, therefore, would do well to consider how far, in present circumstances, their intentions are likely to be carried out by a succession of trustees in perpetuity. Even supposing no malversation in office, it may happen, from the altered state and improved feelings of society, that the execution of the trust in its original form would be positively injurious, or at the very least useless and ridiculous. It is beginning to be a pretty general belief that hospitals for the board and education of children will not outlast another generation, in consequence of the growing conviction that they are not healthy scenes for juvenile nurture and training. Even now, means are in the course of being taken for reorganizing some institutions of this kind on a totally different footing. On this and all other accounts, we would wish to impress on persons of wealth the propriety of disposing of at least a reasonable portion of their spare money on objects of acknowledged utility during their lives. And as this is an age of moral reforms, we are not without hopes of seeing our recommendation in some respects acted upon.

Many elderly single ladies and gentlemen, having no taste for splendour, and no relations so near or dear to them as to call for large legacies, may be supposed to be in no small degree perplexed as to the proper disposal of the wealth which they cannot carry with them out of the world. On these, in an especial manner, is imposed the duty of devoting their spare money to the best objects within their range of view. There could be no difficulty in such persons discovering means and opportunities of doing permanent good by the bestowal of portions of their wealth; and it would surely be a great satisfaction, and one justly due to themselves, if they could see the good beginning felt and acknowledged before they died. What an agreeable thing it would be to observe hundreds of poor children rescued from misery and ignorance, and put in the way of well-doing for life; or to behold a group of poor old decayed people furnished with a comfortable refuge for the rest of their days; or to know that a number of sick, once neglected, were now secure of due care and attendance, all through the means which Providence had intrusted to our hands! A no less blessed thing it were to set apart the superfluity, year by year, as it accrued, and bestow it on the succour of individual cases of undeserved misfortune. The close-fistedness of age is explained as a panic of the self-preservative instinct, excited by the sense of growing helplessness. Money-bags are thought to form a good entrenchment; but the grateful blessings of the wretched would surely be a better. What consolation more substantial can there be for advancing infirmity, and the near approach of unavoidable fate, than the consciousness that, through our humble means, many poor bearers of the

same feeble nature are having their last days alleviated, and sending towards us the sympathies of bosoms on which the same sad shadow is falling? Let us preach of independence as we will, cases are constantly occurring where, from the operation of irresistible causes—forces which no foresight could avert—utter ruin is threatened from the temporary want of a small sum of money. A vast amount of misery might be prevented, whole families might be saved from pauperism, were such small sums advanced at the proper juncture. Here alone is one great channel of usefulness opened to the benevolent over-rich. What happy pictures might they thus provide for the future regalement of their highest feelings!

There are humbler and less interesting, but still laudable ways of bestowing spare money during the life of the possessor. In every considerable town there is occasional need for improvements, which there is no means, in the shape of public money, of effecting. Not one but might be the better of some bridge, or footway, or public green, or garden, which, however, is wanted for years, because of the lack of funds. Here the possessor of superfluous wealth might step in, and in the spirit of social kindness, and as a graceful courtesy from the fortunate one to the industrious many, effect the improvement, or bestow the needed public work. Were a man to act in this manner, governing his conduct by good judgment, and leaving no room to doubt that he merely wished to do good, what a social position were his! He might become almost an object of worship to his fellow-creatures.

If the rich were also the wise, this word might, in its sphere, be enough. As matters are, let it go forth and do its best.

A WALK OVER THE AMPEZZO PASS, TYROL.

WHILST Switzerland is overrun every summer by tourists from all quarters, threading every valley, and mounting every pass, the Tyrol, another part of the same Alpine chain, is in comparison little visited. With the exception, indeed, of that portion which is contiguous to Switzerland, and of the valley of the Inn, there is small likelihood that an English traveller will fall in with a dozen of his countrymen in his rambles through the whole of what the Austrian geographers and lawyers term the princely county of the Tyrol. The reasons for preferring the western division of the Alps are, however, sufficiently obvious. In the first place, the Tyrol is more distant from the north-west of Europe; and in the next, unless the traveller is proceeding from Vienna or Munich, it is out of the way to Italy, the goal of so many thousands, whereas Switzerland is directly in the path. Again, the roads in Switzerland are more numerous, and in better order; the inns on a larger scale, and more adapted to the wants of wealthy persons; the staff of guides and the means of transit far greater, and more complete, in Switzerland than in the Tyrol. In short, the science of touring is studied in one country, and neglected in the other. All the appliances for a pleasant travel, and the requisites for a comfortable sojourn, are nearer at hand, and better understood amongst the Swiss than the Tyrolese, whilst the scenery is more diversified, and the grandest parts of it more accessible. With regard to roads, Austria of late years has perceived the necessity of paying some attention to the matter; and in order to attract travellers and traffic, considerable sums have been expended in opening up new routes and improving the old ones. Over the Pass of the Stelvio, at a height of eight hundred feet above the line of perpetual snow, a broad and well-built road has

been conducted to connect the basin of the Danube with the plain of Lombardy, whilst a readier access to the shores of the Adriatic, from the upper part of that vast basin, has been given by the recently-formed road over the Ampezzo Pass.

A glance at the map will show that, for the length of about eighty miles, the southern part of the Tyrol is traversed by a deep groove, running nearly east and west. This groove is termed the Vale of Puster; but singularly enough, it is formed of two valleys. The whole may be compared to a long narrow trough, the bottom of which slopes from the middle to each end; and from the middle, therefore, the streams flow in opposite directions. At this point there is a mile or two of elevated table-land, called the Plain of Toblach, which is found noticed in the annals of the country as the arena of a bloody contest. Through the Puster valley runs one of the principal post roads of the Tyrol; and one day last summer I travelled along it from Lienz as far as Niederdorf, with the intention of investigating the branch road over the Ampezzo, which quits the former on the Plain of Toblach. Sleeping at Niederdorf, I started betimes, and in less than an hour reached the tall wooden cross that marks from afar the point of divergence. The new road sweeps at once into the jaws of the mountains. In the first ravine lies a small shallow sheet of water, called the Toblach See, such as we should call a tarn in the north of England. But for an embankment at the foot, all the water would run out; and perhaps it is only retained for the sake of the fish, which appeared to be numerous. I turned aside a few yards in order to view the precipices at the head of the ravine, across the sheet of water, and I strongly recommend all travellers to do the like, for the effect was very striking. Soon after leaving the lake behind, we pass through two magnificent portals of dolomite, bare rocks, rising to the height of several hundred feet above the road, and then find ourselves fairly admitted into the Pass, for we have now no longer a view into the vale below. At Höllenstein, a name I would rather leave in its original tongue, there is a neat-looking inn and post-house standing on the margin of a level green meadow. The rocks around this recess are uncommonly fine. The dolomitic peaks, for which this part of the Tyrol is remarkable, are seen rising above the pine forests on all sides. One mass in particular rivets the eye with its long jagged ridge, in the midst of which there is a deep notch holding a glacier. These curious mountains have sadly puzzled geologists, to whom they are a constant object of examination. Mr Murray has described their appearance so accurately in his 'Handbook,' that I shall take the liberty of transcribing his words. 'The dolomite mountains are unlike any other mountains, and are to be seen nowhere else among the Alps. They arrest the attention by the singularity and picturesqueness of their forms, by their sharp peaks or horns, sometimes rising up in pinnacles and obelisks, at others extending in serrated ridges, toothed like the jaw of an alligator; now fencing in the valley with an escarped precipice many thousand feet high, and often cleft with numerous fissures, all running nearly vertically. They are perfectly barren, destitute of vegetation of any sort, and generally of a light yellow or whitish colour.' Von Buch, the mineralogist, started a theory respecting them, which has been adopted by many geologists, though others have dissented from it. He supposed that a bed of mountain limestone had been violently displaced, and thrown into a vertical position, by an outburst from underneath of melaphyr or pyroxenic porphyry—an igneous rock, which has a base of augite or pyroxene, holding crystals of felspar—and that magnesia in a state of vapour was evolved by the melted rock, and penetrating the heated limestone, gave it the crystalline structure of dolomite. The guide-books recommend travellers to visit the secluded valleys of the Gader and the Gröden, for the purpose of inspecting the dolomite rocks. For those, however, who have traversed the Puster

valley between Toblach and Lienz, such a proceeding is unnecessary, since specimens are well seen from several points of the vale; and at Innichen they come down, in eminences of moderate elevation, close to the road. The path we are now describing leads right across the range, and its rocks are seen to great advantage in all their varieties.

Höllenstein being passed, we reach another sheet of water, through which the road is carried by means of a raised terrace. By this time I began to feel the pangs of hunger, and a small inn presenting itself opportunely at a turn, I entered, and inquired what edibles could be procured. A mutton chop? No. A veal cutlet? No. Nothing but boiled beef, and, as usual, boiled to rage, in the German fashion—a dish that for nearly a week I had been compelled to feed upon. No potatoes, or indeed vegetables of any kind, were to be had, and even the meat looked so abominably like horse flesh, that my knife and fork sickened at the sight, and in a hurry the dish was sent away just as it came. At that moment a hen came hopping in front of the window, and a happy thought struck me—perhaps they had heard of eggs! Eggs, in fact, were found; half-a-dozen ordered to be boiled; and during the operation I looked forward with pleasurable anticipations to a tolerable meal. Imagine my disappointment when the six eggs were brought in rolling about on a plate, stripped of their shells, and as hard as stone!

It was not long before I was treading the summit level of the Pass, which is gloomy, from the quantity of pine-wood. There is a peak in the neighbourhood with deep stains of blood-red, as if the top had once formed an altar for some sanguinary sacrifice. A gentle descent leads down to some buildings called Ospitale, from their having formerly been a hospice or place of refuge, charitably founded, and tenanted by monks. The principal dwelling is now an inn. The chapel is yet in existence, swept clean, and garnished with a little furniture, and the bell still hangs over the roof. How indescribably solemn must its faint tones have sounded amongst the hollows of those gigantic mountains, when it called its hearers, a few holy men, to join in the services of the church, or when it knelled over the remains of some storm-lost wayfarer as the brethren consigned them to strange earth!

A short distance below the hospital, the ruins of Beukstein Castle are seen in relief against a mountain black with pines. The formation of the road has here been attended with great labour. It is supported along the hill flanks by immense accumulations of earth, and is carried, by bridges of wood and stone, across divers streams and gullies. One of the finest stations on the whole path is at one of the wooden bridges. On the right hand, immediately above the spectator, but at a great height, the eye runs up a gully, and at length reaches a huge hole in the rocky ridge, through which the sky is plainly visible. In another direction there is a mighty pile of rock, which, by the illusion of distance, seems belted with spiral terraces, like another tower of Babel. When I had gained the neighbourhood of the castle I quitted the road for the sward that slopes gently up the nape of its peninsulated rock, and getting over the outer wall, climbed to the highest fragment of the crumbling ruin. I shall never forget the singularity and magnificence of the scene from that point. My position commanded views in three directions: first, there was the vale I had just travelled through; then, deep, deep beneath, there was a recess that appeared to be a common vestibule to several others that branched off among the hills; lastly, there was another vale, more broad and open than either, along which the collected streams from the glaciers find their way into the sunny Adriatic; and this last the route taken by the road to Venice. The castle of Potestagno, as the Italians term it, has been built on the extreme verge of a precipice at least one thousand feet high, a spur from the grand Alps. It stands at the angle of three radiating vales, and looks, like a wary warder, right down

that along which an enemy from the powerful south might be most probably expected. The new road down to this point has been several degrees removed from the perpendicular; in fact its gradient has been easy. But now it arrives at the edge of a steep step, and much circumspection is required to effect a safe descent. That done, by means of a bold curve, followed by some tourniquetting, it runs forward in a straight line from under the eye, until lost in the long-drawn valley. Lifting one's gaze from the vales to the towering peaks around them, we are struck with astonishment by the variety and strangeness of their shapes. Too grand to admit the feeling of grotesqueness, too fantastic to include a sense of the true sublime, they rise above the forests that clothe their feet in naked and inaccessible majesty, their white rocks exposed to the day, as if a thousand tempests had gathered their whole energies for a single stroke, and, by one explosion of their wrath, had stripped the mountains of their covering, as the lightning strips a tree of its bark.

I left my precarious standing-place with caution: I did not see exactly where a slip would terminate. Instead of rejoining the high road immediately, I made down a bank towards an old wooden foot-bridge visible from above. This bridge is placed across the stream flowing from the Pass, shortly before it reaches the precipice whereon the castle is planted. I found it so crazy an affair, that I had some doubts whether it would be prudent to place my foot upon it; but I crossed safely by a hurried movement, refraining from puzzling my eyes with the fearful gulf beneath. The path on the other side was narrow, much broken away, and required a steady head, as it conducted along the very brink of the ravine through which the stream wormed its way, at a dizzying depth below, to join the Borta. I was rewarded, however, by the splendid view of the castled rock which it presented, seen hence in distinct profile. Two women whom I met on the highway, in answer to my inquiry as to the distance of Cortina, said, '*Una ora.*' The first words of a new language always startle one; hitherto I had heard nothing but German, and these were the first words of Italian that saluted my ear. On referring to my map, I saw that the names of the hills and villages were all Italian, and my guide-book informed me that the valley I was now walking in—the Val Ampezzo—had belonged to the Venetians, until the Emperor Maximilian took it from them, and annexed it to the Tyrol. To my left was a massive wall of dolomite, of amazing height, rent in several spots from top to bottom. When this ended, I looked into a side vale, and with some chagrin perceived the mists creeping down it. Very soon they appeared over other heights, and began descending into the valley; but pushing forward to Cortina, I succeeded in reaching it before the rain commenced.

All through the Tyrol this had been the arrangement of rooms in the inns:—On one side of the entrance, and on the ground-floor, there was the guests' reception-room; and on the other side, or beyond, were the kitchens and private rooms of the house. Frequently the entrance was a wide passage, paved with stones, or flagged, into which carriages and carts were wheeled out of the wet. At Cortina there was a new order of things, and this, combined with my ignorance of Italian, occasioned me much perplexity. I walked into the principal inn, a large building, highly recommended in the guide-book, but searched in vain for anything like a room that I could sit down in. A servant girl came to me, and looked upon my wanderings apparently with some amusement; but as we could not understand one another, she threw no light upon the mystery, and I left the house with an indignation I have now reason to be ashamed of. Trudging farther into the village, I encountered the post-house, and concluded at once that it was also an inn, as post-houses usually are. Again I endeavoured to find on the ground-floor the guests' *salle à manger*; but, worse and worse, all the doors were locked. I applied my stick

pretty fiercely to one, and the noise caused a woman to descend from the upper part of the house; but being unable to make her comprehend what I wanted, I thought there would be no harm if I extended my search above stairs. There I stumbled into a room where there were papers and letters scattered about, giving the place an official look. A man was writing at a table. Doubtless, thought I, here I have got into the august presence of the post-master himself; and I began a short address of deprecation and request, beginning, 'Signor,' but could not muster another word; so I repeated 'signor.' The man of office came to my relief by speaking in German. But when I began to feel at my ease, and ordered some refreshment to be brought, I discovered I had made the old mistake of taking a private house for a caravansary. The man good-naturedly put on his hat and took me to an inn near at hand. By this time I had become acquainted with the fact, that the entertaining-rooms of the inns in this country were on the first floor, the lower rooms being appropriated to domestic uses. At the 'Star,' then, I proceeded at once up stairs, and soon had a savoury dinner before me. The rain descended in torrents, and forbade the execution of my plan, for this day at least, of proceeding across the hills into the Gader valley. There was no help for it but patience; and in the hope of the morrow proving propitious, I employed my thoughts upon the exceeding beauties of the path I had travelled over during the day. Broad enough to hold five carriages abreast, it wound its way amongst the hills, in spite of obstacles, with such easy inclinations, that the traveller requires no extra horses to pull his vehicle up the steeps, and need scarcely have his wheels locked once on the descents. True, the height of the Pass is much lower than most of the other roads across main ranges of Alps, for it does not leave behind the climate of pines: there are no tunnels, and little danger from avalanches, the cause of so much damage to the Stelvio and the Splügen; yet the Ampezzo Pass afforded me, with its extraordinary scenery, one of the most delightful rambles I ever remember to have taken.

When I awoke the following morning, the rain was falling in a calm business-like manner, as if it had made up its mind to go on for a month. It seemed quite clear that I must continue upon main roads, and not think of mountain by-paths. Two courses were open—either to pay a visit to Venice, about 110 miles distant, or to return the way I had come. Venice had great attractions, but my wardrobe was not fitted for the inspection of civilised eyes, being confined to the smallest possible compass, so as to be easily carried in a single knapsack. I gave up the idea of Venice with a sigh, and loitered about until after dinner; then, like a discomfited 'vagrom man,' I shouldered my pack, and marched with a rebellious mind towards the north. I ought to mention, as a specimen of the low charges of the Tyrol, that my bill at the 'Star' for two dinners, bed, breakfast, and three flasks of wine, amounted to half-a-crown! With the maid who waited upon me, the landlord's daughter, I was obliged to communicate by signs. She was attired in a peculiarly pleasing manner: her tight-fitting bodice, laced in front, and little cloth cap with a long tassel, gave her so picturesque and classic an appearance, that I lamented her nose was slightly, though very slightly, *retroussé*, instead of the Grecian form; and I lamented still more that I could not learn from her whether she had ever left her native valley, or where she had studied the aesthetics of dress. As I said before, I re-trod the road I had traversed the preceding day. Stretching a black waterproof cape over my shoulders, to the intense amusement of some little boys congregated under a gateway, I pushed over the hills without stopping, until I reached my night quarters in the Puster valley. All the beauty of the Pass was blotted out by low drooping mists. I hurried on, mortified by my total defeat. The evening had closed in by the time I reached Niederdorf. After a twenty miles' walk, I felt much tempted to put up again at

my former lodging; and in truth it was hard work leaving the lights of the village for three additional miles of darkness; but I had fixed on Welsberg for a resting-place.

AKKATOOK, THE ESQUIMAUX BOY.

THE whalers of the port of Kirkcaldy, which make an annual visit to the stormy, ice-bound shores of Davis' Straits, have often gratified us with live specimens of bears, wolves, foxes, and such-like members of the inferior creation; but last autumn they presented us with an importation of a different kind, being nothing less than a fine Esquimaux boy, named Akkatook. His father is, or rather was, chief of one of the small tribes who contrive to pick up a miserable subsistence on the western shores of these Straits, and hold occasional intercourse with the vessels when they happen to approach the land. Yielding to the boy's curiosity, and influenced no doubt by their notions of the wonderful country from which the large ships and fine things come, his parents delivered him over to Captain Kinnear of the 'Caledonia,' with strict injunctions to take care of him, and under a solemn promise to bring him back next season. When received on board, the boy was covered with the grease and filth inseparable from the native habits; but under the hands of the sailors, he soon underwent a thorough renovation, and became a great and general favourite. At first, the new dietary was far from palatable, and he might be seen making alyly free with such pieces of blubber and drops of oil as came in his way; but he soon became perfectly reconciled to the change, and relished the delicacies of civilised cookery as much as any on board. His dress consisted of trousers, coat, hood, and boots, all of seal-skin, neatly sewed, and tastefully figured with threads and braid of sinew, the smooth glossy hair giving it a variegated and very beautiful appearance. The skirt of the coat was of one piece, and descended almost to his heels, making him look like a large monkey.

What were Akkatook's feelings when he arrived in this country it is difficult to conceive. A greater change than from the barren, treeless, houseless, snow-clad shores of Davis' Straits, to the towns, gardens, and fields of Scotland, cannot be imagined. It was literally a 'new earth' to him; everything wonderful, incomprehensible; yet he deported himself with marvellous propriety, and was scarcely less a wonder to us than the country must have been to him. Akkatook was thirteen years of age, and of low stature, with a broad round chest, short neck, and long, lank, glossy hair, black as the raven's wing; skin soft as velvet, of a hue between the negro and red Indian; the eye dark and lively; and his general expression highly agreeable. The forehead was rather low; but he was of quick apprehension, and his general abilities were good. I should say he was deficient in bone and muscle, and proportionally in strength, compared with our boys of his size and mould.

The best school for Akkatook was free and frequent intercourse with other boys. He necessarily wanted many of those elementary ideas which are acquired in childhood, and form the groundwork of all education. But it was deemed expedient to make some direct efforts for his improvement, and two gentlemen were selected for this purpose, of whom the writer was one. I confess I had previously no idea of the difficulties that had to be encountered. As my pupil's term was to be very short, I was anxious to teach him all I could; but his total ignorance of our language precluded all access to his mind except by signs. I resolved to reach his understanding in every possible way, and the expedients were sometimes amusing enough. After teaching him the letters, and exercising him in the more difficult sounds, I selected a spelling-book which abounds with the names of familiar objects, in order to accustom him to connect the sign with the thing signified. With a multitude of nouns I found no difficulty; he soon knew the

names of all the articles in the room, and of a great number of animals. The latter I explained by imitating the sound of the animal: thus the word *ox*, *moo, moo*; sheep, *may-ay*; dog, *bow-ow*; cock, *cock-akoo-hoo*, &c. an exercise in which he delighted and excelled. The meaning of verbs I endeavoured to explain by going through the action they express; but as may be supposed, words expressing quality and manner, adjectives and adverbs, caused the greatest difficulty. Akkatook was a shrewd observer, and displayed remarkable proficiency in the habits of native life. He knew the number of dogs belonging to every individual in his tribe, and most of their names. Nothing pleased him more than pictures of animals with which he had been acquainted in the far north. On showing one day specimens of the ptarmigan in its winter, spring, and summer plumage, he recognised it instantly; and lighting a bit of paper, pointed out the different altitudes of the sun, to show the season of each dress. A representation of the capture of a whale threw him into raptures, and he acted the part of the harpooner to the life. He was admirable at finding and following the trail of an animal; and with his bow and arrow, would pursue small birds for a whole day, along hedges, and through thorny brakes, with wonderful success. As an instance of his quick-sightedness: I had lost a small key in the dusk of the evening, and sent my own boys to find it; but in vain. Just as we had given up the search, Akkatook made his appearance. Taking another key from my pocket to show him what I wanted, he set out with the speed and keenness of a pointer; and beginning with a large circuit, he contracted it at each round, and in an incredibly short time placed the lost article in my hand. His natural disposition was exceedingly amiable, and his filial affection strong. One night as he sat musing and melancholy, looking into the fire, his kind hostess, who felt a truly maternal interest in his welfare, asked what was the matter; when laying his hand on his breast, and with tears in his eyes, he said, 'Apukia—Apukia!' which was his mother's name. His father had two wives, and it was remarked that he never mentioned the other. Thus in some traits at least, human nature is the same amid the polar snows as in the more congenial regions of the south.

The favour which Akkatook obtained, especially among the young, was as general as the interest he excited. Wo to the luckless urchin who would have dared maltreat him! At the tables of the wealthy, far and near, he was feasted and caressed. A kind invitation reached him from the Duke of Buccleuch; and it is almost needless to say he returned with substantial proofs of his Grace's kindness. The tact he displayed in conforming to our conventional rules of good-breeding was truly astonishing. The only habit he found it difficult to overcome, was that of going away at meals as soon as he was satisfied. The attractions of the window, or rather of the moving world in the street, he could not resist. On a fine day in early spring, a famous regatta was got up, in which our polar hero played a principal part. Troops of the curious lined the shore for upwards of a mile. Among a number of boats, all gaily decked out, might be seen his frail bark canoe, himself seated in the centre, in his native dress, having a single oar, double-bladed, and poised before him, with which he struck the water on each side alternately, and impelled it along with amazing speed, to the infinite amusement of the crowd.

As the time for his departure drew near, presents poured in in great abundance and variety; some of which, by the way, were sufficiently remarkable, considering the country in which he was to live. It is worthy of notice, as a general rule, that the higher the station of the donors, the more appropriate were the gifts, thus evincing proportionate judgment and taste in the selection. He embarked in his old ship, the 'Caledonia,' whose officers tell us that his progress in English during the voyage was matter of general remark and surprise; and indeed it was evident, before

his departure from Kirkcaldy, that his mind was full, and just on the eve of bursting forth, like a bud in spring. But the voyage proved unfortunate: the good old 'Caledonia,' crushed between two floes of ice, became a total wreck, the sailors having just sufficient time to save their lives and a few articles of clothing. In this disaster nearly all his valuable presents were lost. After this he was transferred to the 'Chieftain,' and ultimately delivered to his kindred, with one or two fowling-pieces saved from the wreck, and an ample supply of ammunition from the ship's stores. His father, Makkarook, had died during his absence.

Thus ended the visit of Akkatook, of which different opinions will be entertained. Some will doubt the propriety of bringing him to this country at all, especially when his stay was to be so short and unproductive; and we fear that prudent benevolence will pronounce against it, as preparing him for discomforts and dissatisfactions which otherwise he had never known; but there can be little doubt that the partial training in civilised habits which he enjoyed amongst us, and the smattering of our language which he was able to pick up, will prove advantageous as respects his own people and their intercourse with whalers. His safe return will alone be useful as an instance of the integrity of the English in keeping their promise. What was effected for Akkatook's education may be said to demonstrate the improbability of the Esquimaux, and how much could be done for them by a repetition of such visits as that now described. The only subject for regret is, that Akkatook's stay in Scotland was so short. Had he remained for a few years, he might have been rendered available as a missionary of arts and religion to his tribe—one of that noble band who, in different parts of the world, are toiling in the cause of humanity and mercy.

THE INDIAN ARCHIPELAGO.

THE attention recently excited towards the Indian Archipelago, is owing to peculiar circumstances—at least so far as the body of the public is concerned—more of a romantic than practical nature. Perhaps a brief sketch of the trade, resources, and business prospects of that great island country, may be considered an acceptable contribution to the general stock of knowledge on the subject, and one likely to strengthen, and turn to useful account, the impressions left by more popular and exciting details.

The Archipelago covers an area of between five and six million statute miles, including land and water; and lies directly in the ocean route between the eastern nations from the Arabian Sea to the Sea of Japan, and midway between this route and the Australian continent. By sailing vessels, its eastern extremity is only three days from China, and its western only three weeks from Arabia. On the west it is entered by the Straits of Malacca, between the Malay peninsula (dotted with the British settlements of Penang, Malacca, and Singapore) and the island of Sumatra; and the Straits of Sunda between Sumatra and Java. On the east there are various wide passages or channels, taking their names from the great islands of Luzon, New Guinea, &c. On the south the inlets are narrow and intricate; and on the north and north-west spreads the continent of Asia. The whole of the Archipelago is comprehended within the tropics, the equinoctial line running through the centre of the region.

Such is the geographical position of a country which would appear from its site and other natural advantages to be destined for the seat of a great commercial empire. 'Their boats and canoes,' says Crawford, 'are to the Indian islanders what the camel, the horse, and the ox are to the wandering Arab and the Tartar; and the sea is to them what the desert and the steppes are to the latter'; and a more recent writer remarks, that 'the seemingly permanent dominion founded there by the mean and huckster-like policy of the Dutch, will ere

long be eclipsed by the energy of some other maritime nations of the west of more large and generous views; and the Indian mariners will become merchants instead of pirates; and instead of creeping within the circle of their thousand isles, their flag will be seen in the farthest emporium of the Asiatic and Australian continents.' It is supposed by some that these groups in the aggregate—known to the Arabs under the name of the Twelve Thousand Islands, and said by Marco Polo to comprise 7448 isles—contain a population of nearly forty millions, though the estimate of recent Dutch authorities falls considerably short of half that amount. Even taking the lowest estimate, however, the country must be considered of high importance; and indeed, though comparatively little has been done either to extend the consumption of our own goods, or to stimulate the natives to develop the resources of their several countries, a pretty considerable trade is actually carried on with articles produced in Great Britain, or in the British colonies and dependencies, though not immediately by our own countrymen. We have hitherto contented ourselves, however, with establishing at Singapore a mart, where inexhaustible supplies might be obtained, and have left it to the native merchants to distribute our commodities according to their own means and inclinations. The chief persons engaged in this traffic are the Bugis, natives of Celebes, who, ever since their first appearance in history, have been famous for their daring and industry. Being almost wholly given up to maritime pursuits, they possess numerous prahus, or small vessels, in which they fearlessly traverse the seas, and brave the worst system of piracy that, to all appearance, ever followed in the wake of commerce. These prahus will carry cargoes varying in value from ten to forty thousand Spanish dollars; and as the Bugis are believed to possess several hundreds of such craft, some idea may be formed of the extent of their mercantile operations.

Formerly, the native merchants resorted to Batavia for their annual supply of European goods; but since the establishment of Singapore in 1819, they have very much preferred dealing with the English, chiefly, perhaps, on account of the freedom of our port and the reasonableness of our prices. This circumstance, however, has excited much jealousy and ill-will among the Dutch, who, having in vain endeavoured to allure them back to Batavia, Samarang, and Somabaya in Java, have recently conferred the privilege of a free port on Macassar in Celebes, in the hope of at least sharing the commercial advantages for many years possessed almost exclusively by the English. But there appears to be something like caprice in the course taken at different times by commerce. The Bugis, having once forsaken the Dutch markets, are unwilling to revert to them, so that hitherto little progress has been made towards turning the trade of the Archipelago into its ancient channels. Besides, the new settlement on Labuan will now confer on us additional influence, and greatly facilitate the commercial speculations of our countrymen.

The Bugis, in numbers varying greatly in different years, taking advantage of the easterly monsoon, usually set sail for Singapore about the month of September. On their arrival, understanding the value of time, they diligently apply themselves, by barter or otherwise, to the purchase of a suitable cargo, consisting of bright-coloured cottons, firearms, gunpowder, cutlery, arrack, and opium. It has been remarked that the natives of Celebes themselves prefer their own cotton fabrics, which are much stronger than ours, and of more showy and brilliant patterns; but elsewhere throughout the Archipelago, British goods are much coveted, partly for their cheapness, but partly also for their lightness and elegance. Our manufacturers, however, should be reminded, that if we desire to maintain our hold on that rapidly-growing market, we must be careful to employ bright and fast colours, as the natives are at first taken by show, but must be retained by the excellence of the articles we supply them.

Having completed their cargoes, the Bugis sail eastward, distributing, as they advance, the produce of our looms and forges, and other forms of industry, among the innumerable islands of the Archipelago, receiving in exchange the gold, diamonds, and camphor of Kalamantan or Borneo, the rice of Bali, the eggs and poultry of Sanbock, the coarse sugars of Sumbawa, and the edible birds'-nests, trepang-pearls, tortoise-shell, ebony, nutmegs, cloves, and other spices of the Arru islands and New Guinea.

On almost every one of the articles just enumerated a paper full of interest might be written. The trepang fishery, for example, which depends chiefly for its existence on the peculiar luxury of the Chinese, would supply numerous striking pictures illustrating the manners and character of tribes in various stages of civilisation; so likewise would the occupation of searching for the edible birds'-nests, exposed as it is to innumerable dangers on those wild and desolate coasts, where the sea-swallow delights to build. The same remark will apply to the working of the gold and diamond mines among the mountains in the interior of Borneo, by reckless Chinese adventurers, who exhibit the ingenuity and daring of smugglers in the arts to which they have recourse for defrauding the several chiefs and governments under whose protection they labour; the collection of the camphor gum in remote and unfrequented forests; the cultivation of the spice-trees in the Moluccas; the preparation and pearling of sago, with the great improvements constantly introduced into these processes.

When they have made the circuit of the Archipelago, and reached the Arru group, the Bugis, and other native traders, make directly for the village of Dobbo, erected on a spot of sand projecting northward from the coast of Wama. During the rest of the year, this village, like Berbera, on the eastern coast of Africa, is totally uninhabited. In fact the merchants and traders no sooner depart, than the islanders set fire to the houses which had been erected for their accommodation, in order to be next year employed in building new ones. Immediately, however, on the appearance of the first prahu in the offing, the Arrafuras of Wama flock towards Dobbo, bearing along with them beams and rafters, with an abundance of *utap*, or palm-leaves, for the thatching of the newly-constructed dwellings. Where there was before the most complete solitude, there is now the greatest bustle. Merchants and mariners throng the beach; the prahus are drawn ashore, and protected from the weather by sheds; houses are run up as if by magic; and the goods of the seafarers having been deposited in them, are defended by the guns of their vessels, which are ranged round the habitations, loaded, and ready for use. Five or six thousand strangers often find themselves thus suddenly encamped together, collected from the four winds, for the purpose of selling on that remote outpost of Asia the cottons of Manchester and Glasgow to the crisp-haired blacks of Polynesia.

Nearly all the inhabitants of this suddenly-created emporium are foreigners, who dislike the presence of the natives among them, either because they are addicted to pilfering, or for other reasons found good in trade. The vessels which are too large to be drawn up on the beach, cast anchor on the eastern or western side of the sandpit, according to the monsoon which happens to be blowing. As the season for holding this great mart or fair is universally known, the dwellers in all the surrounding islands come in their prahus to Dobbo, to exchange their produce for the European manufactures. Thither comes the coal-black Papuan, in his long grotesque prahu, containing all his worldly wealth, together with his wife and children, who inhabit two or three huts erected in the after-part of the vessel, and thatched, like everything else in those parts, with *utap*. A railing runs round the prahu, to prevent the little ones from tumbling overboard. Thither also come the natives of Amboyna and Banda, of Timor and

Kiassa, of Gilolo and Oram, and of the Ky and Tenimber groups, each in his own characteristic costume, and prahu of peculiar construction.

Over the whole of this motley assemblage the Bugis exercise the greatest influence, from the energy and fierceness of their characters, their knowledge of the world, and habits of command. The love of gain is their ruling passion, while the natives of the more easterly groups appear to value nothing so highly as the enjoyment of ease. For this reason, the bold merchants of the west, placing no reliance on their enterprise, hire and equip, immediately on their arrival, numerous small prahus adapted to the navigation of the neighbouring seas, and send them forth in all directions in search of such articles as happen to be in most request, taking advantage of that season of calm and beautiful weather which occurs between the monsoons. From the various isles and islets of the Arru group they obtain pearls, mother-of-pearl, tortoise-shell, trepang, and birds of paradise. These birds are shot with arrows by the natives, who, having disembowelled them, wrap them in a thin leaf, and hang them up to dry in the smoke of their fires, after which they are fit for exportation.

Along the coasts of New Guinea, familiar to those eastern navigators, though not to us, the Bugis and their agents collect tortoise-shell, mother-of-pearl, birds of paradise, ebony, ambergris, nutmegs, cloves, massay bark, rosamala, and odoriferous wood, and kayu-bakn—a wood much prized for cabinet-work. On the extent of the resources of Papua it may be rash to hazard an opinion, because by far the greater part of the island remains hitherto unexplored. We venture, nevertheless, to anticipate, that when Captain Stanley shall have surveyed the coasts, and examined the banks of the great rivers, it will be found that no island in the eastern seas is richer, or more deserving of attention. A large proportion of the slaves scattered through the eastern parts of the Indian Archipelago are thence obtained, and it likewise supplies the native navigators, who frequent it, with immense quantities of provisions. Its timber, like that of the Arru islands, is of the most magnificent description, particularly adapted for ship-building; and we may, without a figure of speech, pronounce its forests to be inexhaustible.

When the smaller prahus have obtained cargoes, they return to Dobbo, where, on the approach of the easterly monsoon, preparations are made for sailing once more towards the setting sun. One feature observable in the aspect of this fair world greatly offends the eye of a European—we mean the number of slaves, particularly women and children, kidnapped from the most distant isles, and assembled here to be speedily afterwards dispersed in servitude. On this subject a great difference of opinion exists between English and Dutch writers; the latter contending that slavery in the Archipelago is not accompanied by so many evils as elsewhere, while the former maintain that the atrocities of the system nowhere display themselves in a manner more shocking to humanity. All the disclosures which have come to our knowledge, incline us to take the latter view of the question. But we shall not now enlarge on this unpleasant topic; though it may be permitted us to remark by the way, that a considerable proportion of the slaves are disposed of in the Moluccas, and other possessions of the Dutch.

The traders by this time have exhausted their stock of European goods, and chiefly employ themselves in disposing of their captives, for whom they receive in exchange the commodities of the several isles. But their iniquitous proceedings are not carried on in complete tranquillity. As soon as they have passed the longitude of the Moluccas, a danger is to be looked out for which they dread far more than typhoons or tornados—we mean those cruel and daring pirates, who, under a variety of appellations—Sulus, Illanuns, Jakkarans, and Sea-Dyaks—diffuse terror and desolation through the whole western division of the Archipelago.

Formerly, the chief strongholds of this abandoned race were to be found in Borneo, and more especially in the sultanate of Borneo Proper, or Bruni; but since the operations of the Dido, and of the squadron under Sir Thomas Cochrane, they have betaken themselves to their old haunts in the Sulus and Mindanaos.

In spite, however, of all obstructions, a majority of the native traders find, ultimately, their way to Singapore, where they dispose of their cargoes at a profit for the most part of two hundred per cent. The imports into Singapore in this way are rattans, birds'-nests, bees'-wax, tortoise-shell, gold dust and diamonds, trepang, pearl and raw sago, camphor, rice and paddy, mother-of-pearl shells, garro and lakha woods, paper, seaweed, mats, ebony, and antimony ore. These are from Borneo. From Manilla we have hemp and ropes, cigars, sugar, tea, and sapan wood. From Celebes, sarongs (cottons) of their own manufacture, in addition to the chief productions of Borneo, which last are likewise brought to us from the other islands to the eastward and southward. From Sumatra, Java, and various other places, come bees'-wax, betel nut, coffee, cotton, raw sago, gold dust, copper, tin, rice, and spices. In return for these articles, we distribute opium, iron, British cotton goods, China cotton goods, China crockery, raw silk, and spice.

Before the rise of Singapore into importance, a considerable trade was carried on between the Archipelago and China, which is now merely confined to the few goods brought by Chinese emigrants. In like manner, the influence of the Anglo-Indians has nearly destroyed a commerce carried on with the Talingas of south-western India; while that with the Arabs was greatly injured by the discovery of a route to India by the Cape. The intercourse with Bengal and the Coromandel coast is merely confined to the interchange of opium and cotton goods for gold, tin, and pepper. Attempts have, within the last few years, been made by the Americans, French, and Dutch, to share in the advantages of this trade; but hitherto without much success: not that the field is incapable of being enlarged, and rendered more productive, but that the adventurers have gone injudiciously to work, partly through ignorance, and partly through their reckless and expensive habits. The native traders live in the most frugal manner, often taking along with them in their prahus nothing more than a little rice and sago, with the requisite seasoning; trusting for the rest to the fish, which may everywhere in the Archipelago be found in inexhaustible abundance, and taken with the greatest facility. Nowhere in the world is fish so plentiful, or so varied and excellent, as among the Twelve Thousand Islands, where whole races of men might derive their entire subsistence from the sea alone. The example has been set by that strange race of men the Biasus, or sea-gipsies, with whose history, character, and manners, Europeans are so little acquainted. However, as our commercial relations with that part of Asia are multiplied, our knowledge of the inhabitants will naturally increase, though the history of the world furnishes several examples of long-continued intercourse between distant countries, while each remained almost wholly ignorant of the other.

TEACHING HISTORY.

'WHILE in the country,' says Jean-Jacques Rousseau, 'on a visit for some days at the house of a lady who devoted herself to the education of her children, I happened one morning to be present when the tutor was giving a lesson in history to her eldest son. My attention was particularly attracted at the moment that he was relating to him the anecdote of Alexander of Macedon and his physician Philip. He told of Alexander being sick, and receiving a letter warning him that it was the intention of Philip to administer poison in the guise of medicine. The really honest, faithful physician approaches the monarch's couch with the heal-

ing draught. Alexander puts the warning into his hands, and even while Philip reads, the king drains the cup. When the tutor had ended his recital, he launched forth into warm eulogiums of the courage and intrepidity of Alexander. Though not at all pleased with his remarks, while sharing his enthusiasm, on different grounds, I yet avoided making any objection likely to depreciate him in the estimation of his pupil. At dinner, the boy did not fail to chatter away, his parents, as is usual with parents in France, allowing him to engross nearly the whole conversation. With the liveliness natural to his age, and encouraged by the certainty that he was giving his auditors pleasure, he uttered a thousand absurdities, not unmixed, however, with some happy traits of artlessness and good sense. At length he came upon the story of Philip, and told it admirably. The usual tribute of applause required by the mother's vanity having been paid, some discussion arose upon what had just been narrated. The majority blamed the rash imprudence of Alexander, while some, like the tutor, were loud in their praises of his firmness and courage; but amid the different opinions, I soon perceived that not one single person present had apprehended in what consisted the real nobleness of the action. "For my part," said I, "it seems to me that if there be the least courage in the action, it ought to be regarded as a mere piece of madness." Every one exclaimed at this; and I was about to answer rather warmly, when a lady seated beside me, who had hitherto been silent, bent towards me and whispered, "Save your breath, Jean-Jacques; they would not understand you." I looked at her for a moment, then convinced she was right, I remained silent. After dinner, suspecting, from several slight indications, that my young professor had not taken in a single idea from the anecdote he had told so well, I invited him to accompany me in a walk in the park; and there, availing myself of the opportunity to question him at my ease, I discovered that I was mistaken, and that his admiration of the so highly-lauded courage of Alexander was genuine, and far exceeded that of any one else. But in what do you think he conceived the courage to consist? Simply in the fact of his having swallowed a nauseous draught at one gulp, without the slightest hesitation, or a single wry face! The poor boy, who, to his infinite pain and grief, had been made to take medicine about a fortnight before, had the taste of it still in his mouth, and the only poison of which he had any idea was a dose of senna. However, it must be owned that the firmness of the hero had made a great impression upon his young mind, and he had inwardly resolved that the next time he had to take medicine, he, too, would be an Alexander. Without entering into any explanations, which might have served rather to darken than enlighten his mind, I confirmed him in his laudable resolutions; and I returned to the house, laughing internally at the wisdom of parents and tutors, who flatter themselves that they have been teaching children history. It may be that some of my readers, not satisfied with the "Save your breath, Jean-Jacques," are now asking what it is, then, that I find to admire so much in this action of Alexander? Unhappy dolls! if you must needs be told, how can you understand when told? I admire Alexander's faith in the existence of human virtue, a faith upon which he staked his very life. Was there ever a more noble profession of this faith—a more sublime instance of generous, implicit trust in another, than this potion drained at one draught?'

A VETERAN.

THE following communication respecting an unfortunate veteran has lately been received by us, and is submitted to the consideration of our readers:—

GLASGOW, February 9, 1848.

GENTLEMEN—I beg to bring the following case under your notice. The subject of it is an old naval veteran, whom I found on going into one of the cottages on an

estate in the vicinity of Glasgow, of which I have lately had the management intrusted to me. His name is George Robinson, and he will be eighty-five years old next July, while his wife is only three years younger. How they manage to exist I cannot comprehend, except it be through the kindness of individuals in the neighbourhood. I have never heard a word of complaint from them, and they are generally the first to pay their small mite of rent of any of the tenants on the property, although they must have great difficulty in scraping it together, having no income, except the produce of a small patch of potatoes, which George cultivates in a sort of a way; but having fallen off the roof of his cottage when repairing the thatch two or three years ago, and broken his left arm, which he thinks had not been properly set, he is not able to do much. Could a trifle be got for them, I am sure it would be most gratefully received. The proprietor of the estate, much to his honour, generously agreed to remit the amount of their rent for the remainder of their lives, and placed five pounds at my disposal for their use, on my bringing their case before him. The following is George's history, in his own words:—

"I was born in the month of July 1763, in the town of Stirling; was sent to learn the weaving business at Latham, in the care of Bothkenner, between Falkirk and the village of Airth, when I was ten years of age, where I continued for four years, and then went to Paisley to follow the silk gauze weaving. I left Paisley in the year 1793, in consequence of a great depression of trade, and set out for Manchester: having got as far on the way as Carlisle, I found my funds would not suffice to carry me to Manchester, I turned accordingly to Maryport, and entered the tender lying there. After remaining about eight days, was sent to Liverpool; and after a sojourn at that port of about six weeks, was sent off to Plymouth, and drafted into the *Theseus*, a seventy-four gun ship, Captain Calder, in which vessel I spent the first year, cruising in the Channel. Next year was sent out to the West Indies, and remained there for eighteen months. From the West Indies I returned in the *Theseus* to Quiberon Bay, on the coast of France, and lay there all winter. In the spring, we got orders to pursue the French admiral. We followed him as far as the Canaries, then lost him, and came back to Cadiz, where, having discovered that our mainmast was crippled, our vessel was sent to Plymouth to refit, where Captain Calder died. After refitting, set sail again for Cadiz with stores for the fleet; when lying there, two Spanish frigates hove in sight, making for Cadiz, and pursued by two English frigates, to which they very soon struck.

"After lying some time at Cadiz, we got orders to capture a Spanish galleon from South America, loaded with bullion, which we expected to fall in with at the island of Tenerife. While at this island, we were landed to attack and destroy the town (Yera Cruz), but had to abandon the attempt for want of the necessary provision having been made for victualling the troops. It was afterwards resolved by the commander, Lord Nelson, to attack the fortification next night from the gun-boats. I was drafted into one of them, called the *Fox* cutter, having sixteen sweeps. We left the ship about midnight, and were running right in shore, when a tremendous fire was opened from the Spanish batteries. When abreast of the fort, a shot went right through our boat, which immediately began to fill. The officer in command ordered the sweeps to be put out, and the cutter run out to deep water. On examination, the pump was found choked; and as a last resource, I was ordered to cut the jaw-rope and topping-lift with my tomahawk, for the purpose of easing the cutter; but seeing her rapidly filling, and that she would soon go down, every one endeavoured to save himself the best way he could. I stripped off my clothes, except the shirt and napkin, and jumped into the sea among the sinking and drowning sailors, one of whom got hold of me, and down we both went; but having let go his hold, I rose to the surface again, and swam out from the wreck through the clearest place I could find. I continued to swim and make for the land so long as I had strength; but having become completely exhausted, I turned myself on my back, fully expecting that my glass was now surely run, and repeated a verse from a well-remembered psalm. While doing so, I heard the sound of voices approaching, which turned out to be one of our own boat's crew that was sent to pick up any of the survivors who might be found floating on the fragments of the wreck. When the boat's crew discovered

what it was they had found, one of them declared they would not save any more, as the boat was already too full: but one of my messmates thinking he knew my voice, cried, 'Is that you, George?' 'Indeed,' said I, 'it is;' and they immediately drew me to them with a boat-hook, and I was taken into the boat: it was during this night's attack that Lord Nelson lost his arm.

"After this engagement, we sailed back to Cadiz, Captain Montgomery having been in charge of the *Theseus* since Captain Calder's death. After lying there for about six months, we sailed to Toulon, and from Toulon, through the Straits of Messina, to Malta; sailed again from this port to Alexandria, in Egypt, in search of the French fleet; but not finding them there, returned to Syracuse to take in wood and water; and sailed from thence to Aboukir Bay, where we found the French fleet lying at anchor. We had our share of the battle that was fought there: the first French ship that struck was the antagonist of the *Theseus*, now commanded by Captain Miller. After the battle, we sailed to Lisbon with the prizes, took in stores, and returned to Aboukir.

"From Aboukir I was sent to Acre, and drafted into a gun-boat, forming part of the squadron which was to attack this strong fortress. We were ordered in this gun-boat to take up a position opposite Acre; but the wind shifting, we could not double Cape Carmel, and had to anchor for the night. Next morning, about eight o'clock, our lieutenant spied some vessels in the distance, which he supposed to be Frenchmen; orders us to put the helm hard up, and out with studding-sails, in the hope of escaping, as the French fleet was coming fast up. I was sitting on the end of the mainyard of the gun-boat, when a shot from one of the French vessels cut our yard brace through, and the yard swung round; we then struck, and were made prisoners, and drafted among the gun-boats belonging to the French fleet. The French were very desirous to learn from us what English frigates were at Acre; and on inquiry, some of our men told them there were a number of corn ships there, although they knew that the Tiger man-of-war was lying there. Next day, on the Tiger making her appearance, the French commander called me, as being the most sober of the prisoners, and asked what ship that was; and on my telling him, he turned coolly round and said, 'They prisoners to-day, we prisoners to-morrow;' which soon took place, as we were all recaptured, and our French captors made prisoners. After fourteen months spent at Acre, came home to Spithead, and the following spring was drafted into a forty-four gun-store ship at Woolwich, and sailed out to Egypt with stores; from thence we sailed back to Malta, and arrived there the same day that the corpse of Sir Ralph Abercromby came from Egypt. After spending two years about Malta, and various places in the Mediterranean, came home, and was discharged at Deptford; and from thence I made my way back to Paisley in the year 1802, having been nine years at sea. I lived in Paisley till the year 1822, when I came to Springburn, my present residence, where I have resided constantly since. I had four of a family, two of whom are dead. I have one son, a weaver, living in Glasgow, and another son, who went out to America; but not having heard from him for thirty years, I suppose he must be dead."

"Such is the substance of the poor old veteran's narration. If a condensed notice of it could be made in your widely-circulated Journal, it might be the means of drawing a little assistance to the old couple, who cannot now have many years to live; and I shall be glad to administer such aid in any way that may be deemed most conducive to their comfort. And, apologising for the liberty I have taken, I am, &c.

THOMAS M'GUFFIE.

Mr M'Guffie's address is 125 Montrose Street, Glasgow, and communications may be addressed to him by parties interested in the veteran, whose eventful and ill-starred life he has taken the trouble to record.

SNAIL GARDENS.

ON this curious subject the following paper has been translated for us from the 'Leipsic Illustrated Newspaper':—

In Vorarlberg, the collecting and rearing of the large garden snails, which are so injurious to vegetation, forms a peculiar branch of agricultural industry, and amounts even to no inconsiderable trade. Whole cargoes of these snails

are sent from Arlberg to the South Tyrol, where they are consumed as dainties. The mode of procedure in collecting and feeding them is as follows:—In various parts of Vorarlberg, from the beginning of June till the middle of August, the snails, which, as is well known, seek their nourishment at this season in damp places, and creep about gardens, hedges, coppices, and woods, are collected by boys and girls, and carried to the feeding-places, which are commonly in the neighbourhood of the dwellings of the owners. These snail gardens have usually an extent of from one to three hundred square fathoms of dry garden ground, are quite divested of trees and shrubs, and are surrounded on all sides by a stream of running water. The stream, at its exit, is made to pass through a wooden grating, in order to prevent such of the snails as happen to fall into the water from being washed away. The grating is examined once or twice a-day, generally morning and evening, and the snails found there are replaced in the interior of the garden; this is necessary, as they would otherwise collect into too large quantities, and would become weak and sickly by remaining long in the water. In the interior of the garden, little heaps of pine twigs, generally of the mountain pine, mixed loosely with wood moss, are placed on every two or three square fathoms, for the purpose of protecting the snails from cold, and especially from the scorching rays of the sun. When the pine twigs become dry, and lose their leaves, they are replaced by fresh ones.

Every day, and particularly in damp weather, the snails are fed with the kinds of grass found most suitable for them, and with cabbage leaves. In harvest, at the return of cold weather, they go under cover—that is, they collect under the heaps of twigs, and bury themselves, if the ground under these has been previously dried, two or three inches below the surface, and there they *seal themselves up* for the winter: when this is completely accomplished, they are collected, packed in suitably perforated boxes lined with straw, and sent off.

Careful foddering, and a good harvest season, are essential to the thriving of the snails; and even in spite of this a great many are lost. Wood snails are larger and more savoury, but are more subject to casualties. In each garden there are generally fed from 15,000 to 40,000, and these are sold at about three florins per 1000. This manner of making use of the snails is of double advantage—freeing, on the one hand, fields and gardens from burdensome guests; and affording, on the other, to those so employing themselves, a considerable source of profit.

RUSSIAN GOLD MINES.

During the ten years ending with 1846, the total quantity of fine gold produced in the dominions of the Emperor of Russia was 8,387·96 poods, or 358,063·69 British pounds troy, the value of which, at the rate of 113·001 grains troy weight per pound sterling, will be L.18,761,310. In 1837, the quantity produced was 402·68 poods, or 17,669·60 British pounds troy, the value of which is L.900,673. In 1838, the quantity was 448·93 poods, or 19,699·06 pounds troy, and its value was L.1,004,120. In 1839, the quantity was 448·61 poods, or 19,685·00 pounds troy, and of the value of L.1,003,403. In 1840, it amounted to 498·52 poods, or 21,875·06 pounds troy, of the value of L.1,115,037. In 1841, the quantity was 588·66 poods, or 25,830·40 pounds troy, and its value was L.1,316,653. In 1842, the quantity was 826·58 poods, or 36,270·33 pounds troy, and its value was L.1,848,808. In 1843, the quantity amounted to 1,178·25 poods, or 51,781·61 pounds troy, and of the value of L.2,635,386. In 1844, the quantity was 1,220·84 poods, or 53,570·46 pounds troy, and of the value of L.2,730,647. In 1845, the produce was 1,248·34 poods, or 4,777·16 pounds troy, of the value of L.2,792,156. In 1846, the quantity produced amounted to 1,586·55 poods, or 66,985·01 pounds troy, and of the value of L.3,414,427. The above return comprises the whole produce both of the public and private mines. The Russian government levy a duty of from 12 to 24 per cent. on the produce of the private mines; the rate being subject to no rule, but varying according to localities and other circumstances. During the ten years ending with 1846, the return of produce shows—first, that there has been scarcely any difference in the supply from the Oural Mountains; secondly, that the produce of Siberia has increased more than tenfold; and thirdly, that there has been an augmentation of nearly four to one in the total annual supply. It is said that new mines have been discovered in the Oural; and the fact of

an imperial ukase having lately forbidden the sale of public estates in the region of the auriferous sands of Siberia, justifies the inference that the government have made successful surveys in that direction, and anticipate a further profitable development of the gold-washings which have been so fruitful during the last four years. Under these circumstances, it seems reasonable to expect an increase of supply, of which, however, it is quite impossible to estimate either the proportion or the continuance.—*From a Statement drawn up by Sir E. Baynes, English consul in Russia.*

THE FOOL'S SONG.

[From '*Der Templer und die Jüdin*' ('The Templar and the Jewess') of W. A. Wohlbrück.]

It will go better yet—it will go better yet!
The world it is round, and will roll if 'tis let!
'Tis the word of a fool! but the word it is true;
And if you be wise, you will think so too.
It will go better yet—it will go better yet!
The world it is round, and will roll if 'tis let!

This sighing, and moaning, and raging, and raving,
But adds pain to pain, and new griefs to your grieving.
Oh! shake not and shrink not in ill—look above!
Time changes and changes wherever you rove.
Oh! shake not and shrink not in ill—look above!
Time changes and changes wherever you rove.

It will go better yet—it will go better yet!
The world it is round, and will roll if 'tis let!
'Tis the word of a fool! but the word it is true;
And if you be wise, you will think so too.
It will go better yet—it will go better yet!
The world it is round, and will roll if 'tis let!

And why should you sink in a fit of despair,
Because luck for a moment has planted you there?
Or why thus complain that the night is so black,
When the next morning's sun will bring sunshine back?
Or why thus complain that the night is so black,
When the next morning's sun will bring sunshine back?

It will go better yet—it will go better yet!
The world it is round, and will roll if 'tis let!
It will go better yet—it will go better yet!
The world it is round, and will roll if 'tis let!
'Tis the word of a fool! but the word it is true;
And if you be wise, you will think so too.

M. S. J.

CHAMBERS'S INFORMATION FOR THE PEOPLE.

Or the new edition of this work lately commenced, four monthly parts, embracing sixteen weekly numbers, have now been issued, and the remainder are in course of publication. The present edition, improved in typography and general appearance, may be described as almost a new work—such is the extent of the alterations which it has been deemed necessary to make, in order to include the later discoveries in science and the arts, and also the freshest information on subjects of general knowledge.

With few exceptions, each number or sheet is a distinct and comprehensive treatise, containing the substance of a volume; and the whole are written in a style suitable, it is believed, to popular apprehension. Care has also been taken to arrange the subjects as nearly as possible in a natural order, all treatises of a kindred character following each other. The following are the contents of the four monthly parts now issued:—

- Part 1. Astronomy—Geology—Meteorology—Physical Geography.
- Part 2. Vegetable Physiology—Systematic Botany—Animal Physiology.
- Part 3. Zoology—a comprehensive treatise, in four numbers.
- Part 4. Natural Philosophy—Mechanics—Hydraulics—Optics and Acoustics.

Electricity will follow; and so on. The work will be completed in 100 numbers, or 25 parts, forming two handsome 8vo. volumes—a densely-packed Cyclopaedia of Useful and agreeable Information.

* * * The work is sold by all booksellers. Price of a single number 1d., of a part 7d.

Published by W. & R. CHAMBERS, High Street, Edinburgh. Also sold by D. CHAMBERS, 96 Miller Street, Glasgow; W. & O. 147 Strand, London; and J. M'GLASHAN, 21 D'Olier Street, Dublin.—Printed by W. & R. CHAMBERS, Edinburgh.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 222. NEW SERIES.

SATURDAY, APRIL 1, 1848.

PRICE 1½d.

PAY AND DECORATIONS.

GIL BLAS tells us that Don Hannibal de Chinchilla, after trying for years in vain to get some consideration for his warlike services, in the course of which he had been reduced to a very fragmentary state, was like to go mad when a poet was gratified with a present of five hundred ducats for an ode on the birth of an Infanta. In sober reality, in our own time, we have seen a painter of undoubted merit pass into a fatal insanity on seeing the exhibition of his pictures neglected, while unreckonable wealth was poured upon one whose sole merit consisted in his being about two-fifths of the ordinary stature of mankind. These are types of a whole host of cases. Literature, history, and common conversation are full of the disproportion of dignity and reward to desert. It is a system, after all, not without some redeeming traits; but on the whole, the unsoundness and injustice are its prominent features.

Among authors, who are the honoured and the rewarded?—not the writers of laborious instructive works, not the profound students who develop new and beneficent ideas for the regeneration of society, not even the bards who excogitate that which is to purge the soul with pity and terror unto all time. Well off are these if they escape persecution and starvation. The coin and cheers of mankind are reserved, in great measure, for those who merely amuse their passing hours. The lighter, the more superficial and evanescent the literature, the better the remuneration; the more certain the ovation. Even in the division of results, the immediate bit of bread is usually the author's share, while in the event of the speculation being successful, there is reserved for the bookseller the felicity of battenning on the long-drawn copyright:

'The court awards it, and the law doth give it.'

Perhaps this is an extreme way of stating the case; but undoubtedly the temptations presented to the man of letters are not to great, but to trivial works, and the book tradesman has ten chances of thriving for one within the hope of the mind-devoting author.

Mankind have a perfect sense of the absurdities involved in such anomalies, but they seem helpless to remedy them. Since ever we can remember, the small gains of teachers, as contrasted with the immense utility of the men to society, have been heartily and universally acknowledged. It has been a case like that of Dolph Heyliger's mother, for whom people always said that something ought to be done, but yet never did anything. The point of credit and dignity seems to be in as sad a state. All admit that the teacher should be held in honour; but nobody ever acts on the idea. There is an inveterate tendency to look on schooling as something necessarily connected with

charity (nobody ever scruples to beg for a school), and the poor pedagogue suffers by the association. Snubbed by the parson, patronised by the squire and his daughters, interfered with at every turn by both papas and mammas, who would be a schoolmaster that could be anything else? But is the schoolmaster the only sufferer by this anomaly? Not likely.

The public is tenderer towards the armed force of the country, perhaps from the sympathy we naturally feel for those who expose themselves to danger. Yet here, too, there are anomalies. Our partiality goes all in the form of empty honour; in point of pay, the case of the soldier is not greatly different from that of the teacher. Perhaps the case is all the worse of the honour, since it unavoidably leads to falsity of position. If not endowed with independent means, there must always be an unpleasant contrast between the external pretensions of the poor officer and his actual circumstances! View him in the management of his little income. Study his 'lady,' if he unfortunately has one. The army, we suspect, is only sustained by an endless series of individual delusions, concluding in disappointment. Always looked forward to as a position of distinction; always found, in reality, a routine of meaningless duties and a struggle with sordid circumstances; terminating at the best in something only a little above penury. Grant that money ought not to be an exclusive object, the poor officer cannot help contrasting his own life with that of his prosperous mercantile brother, whose spendings throw ridicule on his own empty purse, and whose ultimate fortune makes half-pay sound like a byword and a reproach. It would be better to have humbler ideas as to a red coat at starting—to know that the brilliancy of a military career means guarding carts of corn to the mill or the port in Ireland, serving as an armed police over refractory operatives at Birmingham, and becoming constables to protect New Zealand settlers from the unruly natives. Were it regarded as simply a position of usefulness, like that of the professional man or tradesman, it would call forth a different class of minds; and there is no reason to suppose that these would be less fitted for the purpose.

It is one of the good traits of the system that the productively useful, as a class, and as against the classes which are not productively useful, are, when they confine themselves to practical objects, well rewarded. The world has never known such wealth as industry has within the last century brought to England. Even the landed aristocracy have derived their noted wealth, and consequently no small part of their importance, from the value which the industry of the country has conferred on land. This is so far gratifying. In the case of the individual, our sympathies will sometimes prevent us from seeing the matter clearly; but when the general case is presented, and we find that services

tending to a practical and positive good are more sure of high remuneration than services which merely gratify the violent passions of mankind, or at best remedy their consequences, we feel as if a great requirement in the fitness of things were yielded to, and a great law observed. Perhaps the triumphs of all occupations and professions could be shown as founded remotely in a principle of philanthropy—the thriving being in proportion to the good design kept in view with regard to the public, or the good actually effected towards the community. Thus a mass of manufacturers who should, by their ingenuity and industry, cause clothing to be twice as easily obtainable by the masses as it had formerly been, would have a good chance of exceeding all their competitors in prosperity. And such would relatively be the case with the practisers of a system of agriculture causing two blades to grow for one, and thus cheapening food. It is essential, however, to all such benefactors of their kind, that they see to their own special remunerations in a purely commercial spirit, and in accordance with commercial methods; for society has as yet no regular or consistent means of rewarding great benefactors of the disinterested species, and no one can doubt of it as a possible event, that a man who had devised the saving of annual thousands of lives, should yet be allowed to breathe out his own in hopeless penury. Bating this drawback, it is so far satisfactory that lines of vocation which clearly and directly contemplate the wellbeing of mankind, are those which it is safest and most profitable to have to do with.

It is, on the other hand, distressing to consider, that within the range of these productive and useful occupations, the success, in special cases, does not depend on the highest and noblest of human qualities, but partly on a group of faculties and feelings which are no more than secondary in the great scale of humanity, and partly, and perhaps in a superior degree, on mere good fortune. Many men of very noble qualities are undoubtedly engaged in industrial pursuits; but they would all acknowledge that, for the transaction of business, they have to place in abeyance both their best intellectual faculties and their loftiest moral aspirations, and call forth into exercise mere sharpness or cleverness, and consult acquisitiveness and love of approbation somewhat more than benevolence or justice. We have known many successful men who had the grace to acknowledge that it was even so. We have known others who had the manliness to admit how much they felt to be owing, in their case, to chance, even while the world gave them credit for an unusual display of the personal qualities which are most likely to promote prosperity. Such being the determining conditions, it is not to be presumed that the most successful are the most worthy, or the least successful the least worthy. The fact is, that all occupations call for a modification or adaptation of human nature for their own needs or duties. The requirements of mercantile life are something not perfect as to absolute human nature, but perfect as to mercantile life. There must be good, but not brilliant ability; enterprise, but not rashness; and so forth. Often, too, it must happen that the dullest qualities, exercised with quiet perseverance and caution, make in time that result which even more perfect mercantile character will forfeit by one false or unfortunate step. So, then, distribution may be faulty as to persons, even where it is most just as to classes.

There is even an inequality with respect to the different portions of one career. Commencements are usually attended by immense difficulties. The saving of the first sovereign costs a fearful struggle, not merely with appetite for expense, but with necessity. The first few years may be passed in the greatest prudence, but they only serve to overcome the general disposition to fear and suspect the untried. Afterwards, money almost saves itself, and character flourishes, although the primary brightness of virtue may have been dabbled a little in the muddy ways of the world. The might that lies, for the control of human destiny, in the first savings of

means, is an astounding consideration for modern men. For the warlike fame and force which made one master over others in the middle ages, there now comes the power of Capital, the command of the lockers and store-houses in which the food and raiment of mankind are accumulated. The possession of a key to these receptacles is what makes thousands fall under the will of one, helping him to store still more and more up in reserve, till his puissance attains a pitch almost fearful to look upon, by reason of the contrast it presents with regard to the laggard fortunes of those who daily spend the daily gain. How far the actual merit can be said to go hand in hand with the increased power, need scarcely become matter of discussion. The two things are notoriously independent of each other.

If absolute merit be little regarded in the distribution of pay, it is no better kept in view in the matter of honours. A man is more apt to fall at the feet of a dog which has saved his own life, than to pay homage to the greatest of sages, who never conferred on him any particular obligation. The army is here in luck; for we appreciate, as matter for approbation and honour, the services of those who take risks in our behalf; and accordingly no small portion of the honours which the state can confer, is reserved for the military, while sages and gentlemen of the pen are left to obtain, if they can, distinctions wanting the government stamp. It were foolish to rail too violently at such things, since it must be a deep-seated tendency of human nature to be actuated more by its feelings—we might almost say its instincts—than its intelligence; and who is to arbitrate between a writer and his race? Let us live in hope, nevertheless, that something like a regulation of the impulsive by the reasonable will come in time, and that decorations, as well as pay, will be distributed more in accordance with justice towards real, though not immediately operative or significant merit.

GOSSE'S BIRDS OF JAMAICA.

This is the work of a minute and faithful observer of nature.* Mr Gosse appears to have studied the birds of Jamaica in their woodland homes; like Wilson, he has shot and described for himself; or at the most, he has only accepted the assistance of one or two enthusiastic resident naturalists of his own stamp. The result is a book composed wholly of original observation, and more readable and entertaining than books of natural history now generally are. Jamaica possesses, besides a moderate show of the swimming and wading birds, and a small group of the accipitres, a great variety of the perchers and climbers—comprising not merely the crows, starlings, thrushes, finches, and swallows, which are common with us, but sundry species of parrots, fly-catchers, honey-suckers, and humming-birds, which we only know as strangers, or from their appearance in museums. Regarding the last of these families, Mr Gosse presents a great deal of new information. He has discovered that, while devotedly fond of the juices of flowers, and will eagerly suck dissolved sugar, they look chiefly to minute insects for their sustenance.

The fine woods of the Bluefields range of mountains are a favourite haunt of the long-tailed humming-bird (*Trochilus polytmus*). To pursue our author's description, 'Not a tree, from the thickness of one's wrist up to the giant magnitude of the hoary figs and cotton trees, but is clothed with fantastic parasites: begonias with waxen flowers, and ferns with hirsute stems, climb up the trunks; enormous bromeliads spring from the greater forks, and fringe the horizontal limbs; various orchideæ with matted roots and grotesque blossoms droop from every bough, and long lianes, like the cordage of a ship, depend from the loftiest branches, or stretch from tree to tree. Elegant tree-ferns, and towering palms are numerous; here and there the wild plantain or heliconia waves its long flag-

* The Birds of Jamaica. By Philip Henry Gosse; assisted by Richard Hill, Esq. of Spanish-Town. London: Van Voorst. 1847. Pp. 448.

like leaves from amidst the humbler bushes; and in the most obscure corners, over some decaying log, nods the noble spike of the magnificent *limodorum*. Nothing is flaunting or showy; all is solemn and subdued; but all is exquisitely beautiful. . . . The smaller wood consists largely of the plant called glass-eye berry, a scrophularious shrub, the blossoms of which, though presenting little beauty in form or hue, are pre-eminently attractive to the long-tailed humming-bird. These bushes are at no part of the year out of blossom, the scarlet berries appearing at all seasons on the same stalk as the flowers. And here at any time one may with tolerable certainty calculate on finding these very lovely birds. But it is in March, April, and May, that they abound: I suppose I have sometimes seen not fewer than a hundred come successively to rifle the blossoms within the space of half as many yards in the course of a forenoon. They are, however, in no respect gregarious; though three or four may be at one moment hovering round the blossoms of the same bush, there is no association; each is governed by his individual preference, and each attends to his own affairs. It is worthy of remark, that males compose by far the greater portion of the individuals observed at this elevation. I do not know why it should be so, but we see very few females there, whereas in the lowlands this sex outnumbers the other. In March, a large number are found to be clad in the livery of the adult male, but without long tail-feathers; others have the characteristic feathers lengthened, but in various degrees. . . . One day several of these "young bloods" being together, a regular tumult ensued, somewhat similar to a *sparrow-fight*—such twittering, and fluttering, and dartings hither and thither! I could not exactly make out the matter, but suspected that it was mainly an attack (surely a most ungallant one, if so) made by these upon two females of the same species, that were sucking at the same bush. These were certainly in the skirmish, but the evolutions were too rapid to be certain how the battle went.

It appears that, small and beautiful as they are, the humming-birds are excessively pugnacious. Near Mr Gosse's chamber window at Phoenix Park, near Savanalle-Mar, there were two Malay apple-trees, covered with blossom, to which a Mango humming-bird had for several days been paying his devoirs. One morning, another came, and the manoeuvres of these two tiny creatures became highly interesting. They 'chased each other through the labyrinth of twigs and flowers, till, an opportunity occurring, the one would dart with seeming fury upon the other, and then, with a loud rustling of their wings, they would twirl together, round and round, until they nearly came to the earth. It was some time before I could see with any distinctness what took place in these tussles; their twirlings were so rapid as to baffle all attempts at discrimination. At length an encounter took place pretty close to me, and I perceived that the beak of the one grasped the beak of the other, and thus fastened, both whirled round and round in their perpendicular descent, the point of contact being the centre of the gyrations, till, when another second would have brought them both on the ground, they separated, and the one chased the other for about a hundred yards, and then returned in triumph to the tree, where, perched on a lofty twig, he chirped monotonously and pertinaciously for some time—I could not help thinking, in defiance. In a few minutes, however, the banished one returned, and began chirping no less provokingly, which soon brought on another chase and another tussle. I am persuaded that these were hostile encounters, for one seemed evidently afraid of the other, fleeing when the other pursued, though his indomitable spirit would prompt the chirp of defiance; and when resting after a battle, I noticed that this one held his beak open, as if panting. Sometimes they would suspend hostilities to suck a few blossoms, but mutual proximity was sure to bring them on again, with the same result. In their tortuous and rapid evolutions, the light from their ruby necks would now and then flash in the sun with gem-like radiance; and as they now and then hovered motionless, the broadly expanded tail—whose outer feathers are crimson-purple, but when intercepting the

sun's rays transmit orange-coloured light—added much to their beauty. A little Banana quit, that was peeping among the blossoms in his own quiet way, seemed now and then to look with surprise on the combatants; but when the one had driven his rival to a longer distance than usual, the victor set upon the unoffending quit, which soon yielded the point, and retired, humbly enough, to a neighbouring tree. The war, for it was a thorough campaign, a regular succession of battles, lasted fully an hour, and then I was called away from the post of observation.

Mr Gosse took several of these birds, and attempted to domesticate them, sometimes with partial success; but generally they quickly died. Amongst those which he kept for some time, he observed much variety of temper; 'some being moody and sulky, others very timid, and others gentle and confiding from the first.' He adds the remark, 'I have noticed this in other birds also; doves, for instance, which manifest individuality of character perhaps as much as men, if we were competent to appreciate it.'

Wilson has already made us acquainted with the mocking-bird; externally handsome, but with nothing brilliant about him; easy and animated in his movements, and possessing 'a voice capable of almost every modulation, from the clear mellow notes of the wood-thrush to the savage scream of the bald eagle.' His powerful notes silence all other birds, and he becomes a substitute for all. 'A bystander destitute of sight would suppose that the whole feathered tribes had assembled together on a trial of skill, each striving to produce his utmost effect, so perfect are his imitations. He many times deceives the sportsman, and sends him in search of birds that perhaps are not within miles of him. Even birds themselves are frequently imposed upon by this admirable mimic, and are decoyed by the fancied call of their mates; or dive with precipitation into the depths of thickets at the scream of what they suppose to be the sparrow-hawk.' In the domesticated state, 'he whistles for the dog—Cæsar starts up, wags his tail, and runs to meet his master. He squeaks out like a hurt chicken, and the hen hurries about, with hanging wings and bristled feathers, clucking, to protect its injured brood. The barking of the dog, the mewing of the cat, the creaking of a passing wheelbarrow, follow with great truth and rapidity.' While pursuing his imitations, 'he spreads his wings, expands his tail, and throws himself round the cage in all the ecstasy of enthusiasm, seeming not only to sing but to dance, keeping time to the measure of his own music.'

Of this extraordinary bird Mr Gosse speaks 'as one of the commonest in Jamaica, bold and forward in his manners, of striking though not showy colours.' Many a time has it caused disappointment to our naturalist. 'Hearing the voice of, as I supposed, some new bird, or some that I was in want of, I have found, after creeping cautiously and perhaps with some difficulty to the spot, that it proceeded from the familiar personage before me.' A friend of Mr Gosse has been at the pains to study the ordinary or proper song of the bird, and has ascertained that it comprehends no fewer than eighteen notes.

'It is in the stillness of the night,' says Mr Gosse, 'when, like his European namesake [the nightingale], he delights

—— "With wakeful melody to cheer
The livelong hours,"

that the song of this bird is heard to advantage. Sometimes, when desirous of watching the first flight of *Urania sloaneus*, I have ascended the mountains before break of day, I have been charmed with the rich gushes and bursts of melody proceeding from this most sweet songster, as he stood on tiptoe on the topmost twig of some sour-sop or orange-tree, in the rays of the bright moonlight. Now he is answered by another, and now another joins the chorus, from the trees around, till the woods and savannas are ringing with the delightful sounds of exquisite and innocent joy. Nor is the season of song confined, as in many birds, to that period when courtship and incubation call forth the affections and sympathies of the sexes towards each other. The mocking-bird is

vocal at all seasons; and it is probably owing to his permanency of song, as well as to his incomparable variety, that the savannas and lowland groves of Jamaica are almost always alive with melody, though our singing birds are so few.

"It is remarkable," observes Mr Hill [Mr Gosse's principal coadjutor], "that in those serenades and midnight solos, which have obtained for the mocking-bird the name of the nightingale, and which he commences with a rapid stammering prelude, as if he had awaked, frightened out of sleep, he never sings his songs of mimicry; his music at this time is his own. It is full of variety, with a fine compass, but less mingled and more equable than by day, as if the minstrel felt that the sober-seeming of the night required a solemnity of music peculiarly its own. The night-song of the mocking-bird, though in many of its modulations it reminds us of that of the nightingale of Europe, has less of volume in it. There is not more variety, but a less frequent repetition of those certain notes of ecstasy, which give such a peculiar character, and such wild, intense, and all-absorbing feeling to the midnight song of the European bird. Though the more regulated quality of the song of our nightingale is less calculated to create surprise, it is the more fitted to soothe and console; and that sensation of melancholy which is said to pervade the melody of the European minstrel, is substituted in the midnight singing of our bird by one of thoughtful and tranquil delight."

The nest of the mocking-bird is not so elaborate a structure as that of many birds. It is built with little attempt at concealment in some bush or low tree, often an orange near the dwelling-house. When young are in possession, their presence is no secret; for an unpleasant sound, half-hissing, half-whistling, is all day long issuing from their unfledged throats; delightful efforts, I dare say, to the fond parents. At this time the old birds are watchful and courageous. If an intruding boy or naturalist approaches their family, they hop from twig to twig, looking on with outstretched neck, in mute but evident solicitude; but any winged visitant, though ever so unconscious of evil intent, and though ever so large, is driven away with fearless pertinacity. The saucy ani and tinkling instantly yield the sacred neighbourhood, the brave mocking-bird pursuing a group of three or four even to several hundred yards' distance; and even the John-crow, if he sail near the tree, is instantly attacked and driven from the scene. But the hogs are the creatures that give him the most annoyance. They are ordinarily fed upon the inferior oranges, the fruit being shaken down to them in the evenings; hence they acquire the habit of resorting to the orange-trees, to wait for a lucky windfall. The mocking-bird, feeling nettled at the intrusion, flies down and begins to peck the hog with all his might. Piggy, not understanding the matter, but pleased with the titillation, gently lies down, and turns up his broadside to enjoy it; the poor bird gets into an agony of distress, pecks and pecks again; but only increases the enjoyment of the luxurious intruder, and is at last compelled to give up the effort in despair.

THE CHEAP EXCURSION.

CHEAPNESS! What wonderfully clever things are done and thought of in thy name—what mighty sums saved—what pleasures realised! We shall not, however, celebrate thy praises in an essay. The philosophy of cheapness may be best detailed in a story—the story of a terribly saving couple whom we lately heard of in Paris.

The morning of the fête of St Cloud shone bright and beautiful, and Monsieur Krukaine, who had set himself on enjoying a holiday, was anxious to be off. 'I think, my dear, it is time to start,' said he to his wife; 'as we mean to walk, it will be wise for us to go before the heat comes on.'

'Well, Monsieur Krukaine,' screamed a shrill voice from an inner room, 'you may be off if you like; but Alexander's face is not washed, and my things are not on yet, and I shan't hurry either.'

M. Krukaine looked at his watch and groaned; but he knew by experience that to endeavour to hasten Madame Krukaine's preparations would only occasion further delay: so, after ascertaining once more that it was really a fine day, he glanced over the newspaper with as much composure as he could preserve. This was a great day in the life of the Krukaines, who had long looked forward to it with keen anticipations of the pleasure it was to afford them. St Cloud is a pretty village on the banks of the Seine, at a short distance from Paris. It possesses a palace and very handsome gardens, which on the fête day of the patron saint of the place are thronged with visitors, and offer a very gay appearance. The Krukaines were retired grocers in comfortable circumstances; their elder children were settled in the world, but the youngest, Alexander Krukaine, a boy about nine years of age, still remained with his parents, who resided in the Rue de l'Arbre, near the Place Dauphine. As the heavy cares of life were over for them, M. and Madame Krukaine might have been considered very happy people, but for the unlucky parsimony of their habits. Nothing literally seemed so difficult to M. Krukaine as to spend a few francs for any purpose not strictly indispensable. To save money was his first consideration in everything; and his contrivances to get cheap bargains, and conduct matters on all occasions cheaply, were most exemplary. Unfortunately, his cheap often turned out dear purchases, when all the cost was counted; but better luck was hoped for next time; and failure accordingly only led to new experiments. Madame had not originally been a votary of cheapness; but from living in an atmosphere of economical devices, she at length rivalled her husband in saving, and after that it would have been difficult to say who was the cleverest in scenting out a bargain, or contriving means for holding in money. In carrying out their projects, they stoically deprived themselves of the most innocent pleasures, lest they should cause any expense. They declared that their means would not allow them to see company. As every one knew this to be false, the Krukaines were soon called selfish, avaricious people; but to this they remained perfectly indifferent; M. Krukaine, who piqued himself on being a philosopher, remarking that as calumny was the usual reward of merit, they had no right to be surprised at the treatment they experienced from their neighbours. If the truth must be told, they were rather glad than otherwise at the turn which reports took against them. They had the pleasure of thinking they were unjustly persecuted, and this pleasure they had the satisfaction of enjoying without cost: it was a cheap way of getting amusement.

Such being their disposition, it was not without mature deliberation that the Krukaines had adopted the resolution of going to the fête of St Cloud; but the beauty of the weather rendered the temptation irresistible; besides, they determined to spend so very little, that it would be scarcely worth mentioning. A circumstance which increased their wish of seeing the fête was, that several lodgers of the house in which they resided had resolved to go to it in a party, and spoke enthusiastically of the pleasures they anticipated from the excursion. The Krukaines had been invited to join them, but had churlishly refused; for as M. Krukaine prudently observed, 'What was the use of going with other people, when you could gain nothing by them?' They accordingly determined to go alone. Madame Brenu, a sarcastic widow who lived on the same landing with them, and who was to be one of the picnic party, did indeed make some malicious and spiteful remarks about stingy and unsocial people; but as Madame Krukaine loftily observed, in emulation of her husband's philosophy, 'She was above such things, and should treat the woman's impertinence with the calm contempt it merited.'

Though M. Krukaine, after waiting a very long time, ended by thinking madame would never be dressed, she was ready at last, and appeared in the full glory of a

bright yellow bonnet and brick-red shawl, which, though somewhat out of date, were still as good as new. On one arm she carried a large and heavy basket, well stored with provisions for the day, whilst in her other hand she brandished an old blue parasol. Madame Krukaine was a thin, little woman, with pinched features, and a long shrewish nose. Behind his maternal parent came Alexander Krukaine, a dull, sleepy-looking boy, whose face now shone with uncommon brilliancy, owing to the recent application of soap and water. M. Krukaine needs no description: he was a thick, commonplace-looking man, possessed of a tolerable share of good-nature; but long habit had enabled him to lay this superfluous quality under such remarkable control, that few persons could have suspected its existence. He now no sooner perceived his wife and son, than, notwithstanding the philosophic spirit on which he prided himself, he betrayed his impatience to be off by immediately leading the way down stairs. Madame Krukaine followed him, secretly hoping they might leave the house without being seen by Madame Brenu. But the watchful widow had been waiting for them the whole morning; and they no sooner appeared on the landing, than she opened the door of her apartment, and thrust out her head, observing with a sarcastic sneer, 'So you are going! I hope you may enjoy yourselves. I know we shall, for Monsieur Theodore, the lawyer's clerk, is to bring his flute, and Monsieur Ledru, the first-floor lodger, his guitar. Then we each take something to eat with us; I have a fine melon for my part. But bless me, Madame Krukaine, you are not going to carry that heavy basket, and surely you do not mean to walk in this heat? We have hired a char-à-banc, which is to take us there and bring us back again for a very reasonable sum indeed. But I suppose you would be too proud to go in a char-à-banc?'

Without heeding this impertinent speech, the Krukaines passed loftily on, and deigned her no reply. The day was fine, but uncommonly warm. M. Krukaine, who carried his wife's heavy basket, soon discovered this, and they had not proceeded far, when he observed to madame, 'I think, my dear, we shall be very much fatigued by the time we reach St Cloud: had we not better ride there? Perhaps this countryman, who seems to be going our way, might give us a lift.'

The countryman was indeed willing to take them to St Cloud in exchange for a small sum, which, by dint of haggling, Madame Krukaine reduced to a very trifling one. The whole family accordingly got up, M. and Madame Krukaine exchanging looks of congratulation on their excellent bargain. They soon discovered, however, that the cart went rather more slowly than they could have walked. As this would not answer, the countryman urged his horse, which went off at a smart trot; but the cart not happening to be upon springs, the Krukaines were in consequence so unmercifully jolted, that they soon asked for a respite. They still felt much cramped, for there was only very scanty room in the cart; but this they bore with the heroism which belongs to true economy, when, as ill luck would have it, a light and handsome char-à-banc, containing the pic-nic party, passed by them. Madame Krukaine devoutly hoped they might not be recognised, but her yellow bonnet was too conspicuous not to attract Madame Brenu's eye. The widow not only saw them, but drew the attention of the whole party upon them, and gave them an ironical nod as the light vehicle passed swiftly by, and left the slow, jolting cart far behind. Though the Krukaines were greatly mortified, they affected to treat the matter lightly. M. Krukaine, especially, took a very philosophic view of it, and was at great pains to prove to himself and to his wife that a cart was by no means inferior to a char-à-banc; but although madame agreed with him, and went so far as to say that she preferred the cart, they both got down very willingly from the vehicle as soon as they had reached St Cloud. They had come so slowly along that it was now about twelve, and the

Krukaines soon discovered that they were hungry. Their first care, therefore, was to select a convenient spot where they might take a slight repast. They were quarrelling on the subject—for Madame Krukaine wanted to remain within sight of the fête, and her husband as energetically remonstrated against this course—when the good lady suddenly gave a shriek of horror, and exclaimed, in a tone of the deepest dismay, 'The basket!'

M. Krukaine turned hastily round, filled with prophetic dread: the basket, which should have been on his wife's arm, was gone.

'In the cart!' screamed madame; 'you left it in the cart.'

'I think, my dear, it would be more correct to say you left it. What had I to do with the basket?'

'I say you left it, Monsieur Krukaine: had I not Alexander to mind? You ought to be ashamed of yourself—a new basket I bought only the other day, besides a cold roast capon, a pâté, a bottle of wine, a porcelain dish, and a damask cloth. Well, I do compliment you on your day's work. Oh you may sneer away!'

M. Krukaine here suggested that the cart might not be gone yet, and he accordingly ran back to the spot where they had alighted; but vain hope! no trace of it remained—cart, basket, cold capon, wine, and pâté, all had vanished. This was the more provoking, that it was very rarely the Krukaines ventured to indulge in such luxurious fare as they had promised themselves for that day. M. Krukaine's hunger silenced his philosophy for a while, and he slowly returned to the spot where he had left his wife in a very bitter mood, which the thought of the capon on which the countryman was going to feast rendered particularly desponding.

'Well, sir,' triumphantly exclaimed Madame Krukaine, 'where is the basket?—your basket, sir!'

'It is useless to talk of it now, my dear; the question is, what shall we eat?'

'You may eat what you like, Monsieur Krukaine; but surely you cannot be very hungry, or you would not have left your basket behind you.'

Without heeding this taunt, M. Krukaine immediately proceeded to a restaurateur's, where, on paying a very high price, he procured some cold meat, a loaf of bread, and a bottle of wine. With these provisions the family made a very indifferent meal, the relish it might otherwise have afforded them being destroyed by the consciousness of their loss. When the repast was over—and, as Madame Krukaine bitterly observed, it did not last long—M. Krukaine proposed that they should take a walk; his wife sullenly consented; and they accordingly went over the gardens, looked at the fête, and endeavoured to admire the fine prospects around them. But it was in vain they sought to be amused; disappointment and vexation damped their joy, and a cloud even came over M. Krukaine's philosophic spirit every time he thought of the cold capon. As though to increase their annoyance, it so happened that, in going through one of the pleasant woods near the gardens, they came to a grassy spot which had been chosen by the pic-nic party for their resting-place. A large tablecloth had been spread on the grass; the meal was laid out upon it, and though a somewhat heterogeneous one, it looked sufficiently tempting to awaken keen feelings of regret and envy in the Krukaines. It was also remarkably aggravating to see in what good spirits the whole party seemed to be. M. Theodore's flute and M. Ledru's guitar were giving forth sweet sounds for the amusement of the company, and to the great delight of a few children who were amongst the pic-nic party, and danced on the grass with a glee which showed their entire satisfaction. This sight produced a great effect on Alexander Krukaine's feelings, which had hitherto been in a dormant state; he perceived at a glance the enjoyments of which he had been deprived, and insisted on joining the party forthwith. His parents peremptorily refused; and as they had fortunately escaped Madame Brenu's

eye, they hastened to leave the spot whilst still unseen. Alexander felt aggrieved; this feeling increased when Madame Krukaine positively forbade him to go near the stalls, temptingly covered with toys and sweets; and snappishly declared that too much money had already been thrown away on that day for her to think of squandering any more by the most trifling purchase. There was a good deal of stubbornness in Alexander Krukaine's disposition; he was, moreover, accustomed to great indulgence, and on the present occasion he thought himself extremely ill-used. To show a proper sense of his wrongs, he spared no pains to render both himself and his parents thoroughly uncomfortable. This was easily effected. Whenever they wanted to rest, he insisted on going on; and when, on the contrary, they wished to walk, he declared himself too fatigued to proceed. Madame Krukaine scolded, M. Krukaine remonstrated and threatened by turns; but nothing could produce the least effect on Alexander, who was now roused to a state of dogged resistance.

The Krukaïnes were heartily glad when evening came on. M. Krukaine, who felt a most unphilosophic appetite, hinted something about having dinner; but madame sharply observed that they had already dined; and though her husband felt this to be a most lamentable fiction, he was compelled to acquiesce. The question was now how they were to go home. They endeavoured to secure some conveyance, for fatigue had so far conquered their feelings of avarice, as to make them willing to sacrifice a few francs to comfort. But this was the hour when every one was returning—the most insignificant vehicle suddenly rose in importance, and extravagant sums were asked and given for a seat.

'We will walk home,' indignantly exclaimed Madame Krukaine, on beholding this deplorable state of things; and as her husband seconded the heroic resolve, they set out immediately. The evening was close and sultry, and before they had walked a quarter of a league, Alexander Krukaine, exasperated by this forced march, sat down by the roadside, and expressed his solemn determination of not going one step farther. His parents walked on, pretending to leave him behind; but Alexander, who had grown accustomed to misfortunes, remained insensible to this one, and was fast asleep by the time they returned near him. What was to be done? M. Krukaine suggested a sound whipping as soon as they should reach home. But as this afforded no present relief, his wife sharply bade him hold his peace, and began a long recriminating speech, by which she clearly proved that all their sufferings originated in M. Krukaine's loss of the basket. They were still in this dilemma, when a *fiacre* drove up to the door of a villa, near which they were then standing. A gentleman came out of the house and stepped into the coach. 'Place Dauphine,' said he to the coachman, who nodded and took his seat.

M. and Madame Krukaine exchanged a rapid look of intelligence. Place Dauphine was close to their abode; the seat at the back of the *fiacre* was wide; the night was dark, no one could see them. In short, after a very brief hesitation, they seized on the slumbering Alexander, and sprang up stealthily on the convenient seat, whilst the unsuspecting coachman drove off.

The Krukaïnes actually chuckled with exultation at the success of their stratagem. There was something so truly delightful in the idea of riding home for nothing, that it made them forget the miseries of the day. It is true that they were rather uncomfortably seated, and that Alexander, who seemed determined to drown the remembrance of his woes in sleep, was every minute in danger of falling off; but, as M. Krukaine wisely remarked, 'What would be the use of philosophy, if it did not teach us to bear patiently such trifling inconveniences?'

They accordingly bore their trials with exemplary fortitude, until they discovered, to their dismay, that it was beginning to rain, or, as Madame Krukaine bitterly declared, 'to pour.' The unhappy lady opened her

parasol in the vain hope of sheltering her bonnet; but the only consequence of this arrangement was to transfer to it some of the blue of the parasol. She fortunately remained unconscious of this unlooked-for result, and entertained herself by lamenting the loss of her husband's basket, as she persisted in terming it. M. Krukaine was thoroughly fatigued and hungry. These were sufficient evils even for a sage, and he accordingly fell fast asleep, heedless alike of madame's scolding and of the rain which poured upon him. It was not until the *fiacre* stopped that he awakened with an alarmed start; but he immediately recollected the necessity of silence, and alighted noiselessly. His next task was to take down Alexander, who was still in the embrace of Morpheus, and to rouse Madame Krukaine, who had followed the example of her husband and son. These delicate proceedings were conducted with so much discretion, that neither the tenant of the *fiacre* nor the coachman suspected what was going on. Whilst there was a chance of detection, the Krukaïnes prudently remained within the deep shadow of one of the neighbouring houses; but as soon as the *fiacre* drove away, M. Krukaine, who felt uncomfortably cool about the head, exclaimed, 'My dear, will you be kind enough to give me my hat?'

'Your hat!' indignantly echoed his wife; 'what have I to do with your hat, sir?'

M. Krukaine was stupefied by this new misfortune. Though he had evidently lost his hat whilst sleeping behind the *fiacre*, he refused to believe in this melancholy truth, and repeatedly declared there must be some mistake, that it could not be. Madame Krukaine listened to her husband's lamentations with bitter triumph, and sarcastically asserted that she felt delighted at what had occurred. This was extremely aggravating, and her spouse took it in very ill part; he and madame therefore quarrelled on the subject until they grew tired of it; after which they began to think of going home. But though they knew they ought to be within a very short distance of their dwelling, they could never succeed in finding the turn which led to it: they at first ascribed this to the darkness of the night.

'Most extraordinary, to be sure!' exclaimed M. Krukaine, rubbing his eyes to ascertain that it was not in them the mistake lay. 'Will you be kind enough to tell me the name of this place?' he asked of a man who happened to be passing by.

'Place Dauphine,' was the answer.

M. Krukaine breathed freely, and next inquired for the way leading to the Rue de l'Arbre.

'I don't know the street.'

M. Krukaine's doubts returned. Perhaps this was not the Place Dauphine; but the man reiterated his assertion. Then where was the Rue de l'Arbre? The man again declared he did not know.

'But, my friend,' coaxingly observed M. Krukaine, 'let me tell you it must be very near this spot.'

'And let me tell you,' testily answered the man, 'there does not exist such a street in all Versailles.'

'Versailles!' echoed M. Krukaine in a hollow tone.

'Versailles!' screamed Madame Krukaine.

Alas, they were indeed in Versailles, which possessed a Place Dauphine as well as Paris! The unhappy couple, forgetting all their causes of dissent, looked on one another in mute despair. Versailles was much farther from Paris than St Cloud; the rain still fell heavily; a neighbouring clock struck twelve; in short, their misery seemed complete. M. Krukaine, whose imagination seemed affected by the misfortunes of the day, scrupled not to declare that they were persecuted by an inexorable fatality. One moment he felt tempted to defy his destiny; but on second thought, he resolved to delay doing this until he should be safely home—an event which, as he bitterly observed, did not seem likely to occur for some time yet. In the meanwhile, Madame Krukaine, who, according to her own assertion, had been prepared, since the loss of her basket, for

everything which had occurred, learned from the individual who had apprized them of their melancholy situation, that they would find a little inn in one of the neighbouring streets, where they might probably gain admittance for the night. It was not without much difficulty that the unhappy Krukaines succeeded in discovering this place of refuge, and in rousing the inmates, who, on beholding their pitiable condition, consented to receive them, although they were unprovided with a passport. But even when they found themselves in a comfortable room, and to all appearance safe, M. Krukaine remained sceptical, and refused to believe that their misfortunes were over.

'Don't think yourself safe yet, my dear,' he gravely observed to his wife, as they retired for the night; 'we are the victims of fatality.'

M. Krukaine's first act on awakening the next morning, and on ascertaining, though he declared himself astonished at such an escape, that he had not been spirited away during the night, was to send for a hatter, in order to replace the indispensable article of wearing apparel he had unfortunately lost. Of course he was dreadfully cheated; the hatter knew that he lay at his mercy, and made the most of his advantage; but M. Krukaine was now prepared for anything, and he bore the imposition with a kind of desperate resignation. Madame Krukaine did not yield so readily to the decrees of fate; she gazed with unutterable dismay on her bonnet, to which her parasol, through the agency of the rain, had imparted a green tint; and like those struck by some sudden calamity, she remained incredulous, and long refused to believe in the reality of this lamentable metamorphosis. When the Krukaines had breakfasted—and they now felt a sort of recklessness at whatever expenses they might incur—they secured a vehicle, of which the owner engaged to take them to their own door for what M. Krukaine termed an enormous sum; but this was of little consequence, as he had made up his mind to submit to all the exigencies of destiny until he found himself at his own door in Paris. There they arrived at length, after undergoing, as he observed in a melancholy tone, a series of unparalleled misfortunes. They had indeed the appearance of travellers returning from a disastrous voyage. Madame Krukaine's features were haggard and fatigued; Alexander looked stupefied and dirty; and though M. Krukaine had suffered least in outward appearance, his startled air plainly bespoke the unhappy victim of fatality.

The family had no sooner alighted from their conveyance, than they perceived the sarcastic countenance of Madame Brenu looking down on them from her window.

'Why,' she screamed out, 'where have you been all this time, we were so uneasy? I hope you enjoyed yourselves. We had quite a delightful day of it I assure you; dined in the wood, and came home just in time to escape the rain. I hope you did not get wet. But dear me, what is the matter with your bonnet? Green! I declare; surely it was yellow yesterday? And where is your basket? Ah! empty of all the good things by this, I dare say?' And so the provoking woman went on, whilst the unhappy Krukaines, now resigned to anything, did not even attempt to retort, but retired to their apartment.

For several days the Krukaines could think of nothing but the disasters which they had met with in the pursuit of pleasure; and M. Krukaine clearly proved to his wife that a more unhappy couple had never gone to the fête of St Cloud. His next act was to ascertain the precise sum they had spent in their unlucky expedition. After a good deal of nice calculation, he found that, including the loss of the basket and hat, besides the total ruin of the bonnet and parasol, their expenses amounted to fifty-seven francs twenty-five centimes. Madame Krukaine raised her eyes and clasped her hands as she heard this lamentable result, from which she concluded that it was perfect ruin to think of pleasure—a sentiment in which her husband entirely acquiesced.

But even this soothing delusion was not granted to the Krukaines; for as Madame Brenu took good care to inform them of the exact sum which had been spent by the whole pic-nic party, they soon perceived that there are two methods of economising—one by which pleasure can be procured at a moderate expense, whilst serious loss and inconvenience are too frequently entailed by the other. The effect produced by this discovery is not yet known; but it is thought that the fit of rheumatism from which M. Krukaine suffered shortly after the fête of St Cloud, considerably softened the rigidity of his economy, whilst the loss of her yellow bonnet produced a similar effect on Madame Krukaine's feelings.

Though the Krukaines have not yet had the magnanimity of acknowledging their mistake, they have lately manifested signs of improvement in a more liberal style of living. What must be considered a good sign of approaching common sense, was an observation which madame made the other day to a neighbour, 'that she was afraid there is no way of getting a franc for a centime;' or, as this wise saw may be Anglicised for general benefit, 'THERE IS NO GETTING A SHILLING FOR A SIXPENCE.'

THE BREAKWATER AT PLYMOUTH.

AN account of this great work, the most successful of the kind ever executed in this country, which involves so many important principles in theory, and displays so much skill in the construction, can scarcely fail of being generally interesting. A large book, just published, at the expense of an eminent engineer, puts us in possession of authentic documents from which we may compile a connected narrative of the proceedings from their commencement.* From the earliest periods of our history, Plymouth has been a much frequented port, well situated for trade, and the headquarters of government expeditions. The town stands at the inner end of the inlet known as Plymouth Sound, of which the two extremities to seaward are the Lizard and Start Points. Properly speaking, the Sound comprises an area of three miles in length and width, receiving the waters of three rivers. The shores are hilly, and in some places project, so as to diminish the width to a mile and a half, and form bays more or less secure, which, before the erection of the breakwater, were the only refuge for vessels. The Sound is exposed to winds, ranging easterly and westerly over twelve points of the compass. The south-westerly are the most prevalent, and drive in waves from the Bay of Biscay and the Atlantic with a force that appears altogether irresistible, and is often productive of disastrous effects. Notwithstanding these risks and inconveniences, and the commercial importance of the station, no attempts were made to remedy its defects during a long course of years; and although one of the most capacious harbours in the kingdom, it was really useful only in fine weather, or with the wind off shore. At length, in 1806, the idea of a breakwater was suggested by Earl St Vincent; and in the same year Mr Rennie, architect of the Bell-Rock lighthouse, and Mr Whidbey, a naval officer of great experience, were ordered by the Admiralty to make a survey, and draw up a report on the subject. Proposals had been made to construct piers running out from the land on either side of the Sound, as a practicable means of affording protection to shipping; but these were disapproved of by the surveyors, as favouring the deposition of shoals, and at the same time taking up the deepest water. Their recommendation was for a detached mole or embankment, to be built on a line of shoals, known as the San Carlos and Shovel Rocks, already existing in the middle of the channel, which would shut in an area of about 2000 acres as a secure anchorage, and accommodate from

* A Historical, Practical, and Theoretical Account of the Breakwater in Plymouth Sound. By Sir John Rennie, F.R.S., &c. Folio. London: H. G. Bohn, and J. Weale. 1848.

forty to fifty vessels of the line, besides merchantmen. The surveyors' report contained, in addition, the plans and specifications for supplementary moles, to project from the shore as circumstances might require. Most skilful precautions were taken against the formation of deposits and the influence of currents, and the calculations, as shown by the result, were in all cases well founded.

Here the matter rested until 1811, when it was again resolved to attempt something for the protection of the 'magnificent harbour,' one of the reasons urged being, that it was 'so well situated for the stationing of his majesty's fleets that are to oppose the navies of France and Spain.' Projectors came forward with their schemes: the most noteworthy were those of General Bentham: he proposed to construct huge frames of wood, and moor them in the required situation, so as to break the force of the waves. These were objected to, from their liability to be carried away by every gale. Another plan was put forward, which comprised the building of 140 hollow towers of stone, each fifty feet in diameter, with walls six feet thick, to be floated out to the station, and there filled with stones, and sunk in two rows; the towers of the inner row opposite the intervals in the outer one: the force of the waves would thus be broken, while no impediment was opposed to the tidal currents. Some discussion arose out of these plans; but the mole or breakwater, as first recommended, was finally decided on.

The depth of water on the rocks varied from five to eight fathoms; the proposed structure was to be ten yards wide at top, seventy yards at the base, and to rise ten feet above the surface at low water. Experience had demonstrated the uselessness of throwing down a heavy mass, and trusting to its weight to resist attacks of the sea. Old ocean is not famed for docility: the action of waves, and other natural laws, had to be considered; and 'under all the circumstances, the plan of depositing loose angular blocks of rubble, or rough stone, as raised from the quarries, from half a ton to ten tons weight each, and upwards, mixed with smaller materials, in the line of the intended breakwater, was considered the best and most advisable plan, and was accordingly adopted. These blocks of stone, it was justly considered, would naturally find their own position, and slope or inclination, according to the depth of the water, the strength of the waves, and their own specific gravity; and after a time, would become wedged and consolidated together by the sea, in a much more effectual, substantial, and economical manner than could be effected by any artificial means; and great saving of time and cost would be effected in carrying on the work, and in giving protection to the Sound.'

This method of throwing down rubble, which was known to the Tyrians and Carthaginians, had been adopted in constructing the harbours of Howth and Holyhead, but never before attempted in this country on so large a scale, or with so successful a result. Abundant materials for the work were found in the hills forming the shores of the Sound: the corporation of Plymouth offered to supply 2,000,000 tons of stone, free of charge, if quarried according to the terms they prescribed. The quarries, however, were opened at Oreston, a place which presented facilities for shipping the stone, and operations actually commenced in March 1812: rails were laid down, wharfs built, and vessels and machinery provided. Two mooring chains, 1200 yards in length, were sunk, one on each side of the site of the breakwater. Smaller chains, connected with buoys, were attached to these at certain intervals, to mark out the line of work. The larger stones were conveyed in vessels of peculiar construction, from seventy to eighty tons burden. These were fitted, both in the hold and on deck, with a double line of rails, with windlasses for heaving loaded trucks from below, and tilting platforms at the stern. The trucks, loaded at the quarry, were lifted in by powerful cranes, or, when the tide permitted, run on board by inclined tramways. The vessel, with

her load, was then removed to the ground marked out by the mooring chains, and made fast at the required spot; a truck was heaved up, run along to the tilting platform, and the block of stone dropped into its place. In this way the entire lading was deposited in less than an hour, and in favourable weather the vessels made three or four trips a day. Besides these, there were forty-five smaller craft, for the conveyance of smaller stones and loose materials for filling up interstices. The rails, trucks, wagons, and vessels, were provided by the government, and kept in repair by the contractors, who, on their part, furnished labour, tools, and implements, and powder for blasting. The expense of working the tilting vessels, and of conveying all stones above five tons in weight, was also borne by the government.

On the 12th August 1812, the Prince-Regent's birthday, the first stone was deposited on the Shovel Rock. As the best means of determining the length of the structure, the work was commenced in the centre, and carried towards the two extremities. By the end of March 1813, 43,789 tons of stone had been thrown down, and in some places the blocks appeared above water. In another year the mass was of sufficient size to afford a protection to ships: the Queen Charlotte and some other large vessels rode out a gale in safety, anchored inside the breakwater. Eleven hundred yards were above the surface in August 1815, when, instead of ten feet above low water, it was determined to raise the barrier to twenty feet, at which height it would be two feet above high water, and afford shelter to small as well as large vessels. The engineers' anticipations as to the tidal currents were completely verified; their flux and reflux were found to be scarcely if at all interfered with. In November 1816, heavy gales broke out, and continued for several days; but the work stood firm, although 300 yards were up to the full height. Two months afterwards, gales, at times fierce as a hurricane, and accompanied by spring tides, set in, when the value and efficiency of the breakwater were proved by the preservation of the vessels anchored within it, while two others beyond the line of protection were wrecked with a serious loss of life. About 200 yards of the rubble were displaced; blocks weighing from two to five tons were carried over from the outer to the inner slope. The former had been built up one foot perpendicular for each three feet horizontal, but after the gale the proportions were five feet to one. The sea had thus found its own slope, and washed the rubble to an angle at which it would remain undisturbed. The slope of three feet to one was adopted, in deference to the opinion of Mr Whidbey, although Mr Rennie had from the first recommended an inclination of five to one. In their report to the Admiralty on the extent of the derangement, the engineers declared that, far from being injured, the stability of the work was greatly increased, the only circumstance to regret being that the storm had not occurred twelve months earlier. In such an undertaking a gale was the best artificer; and they recommended that the whole should be finished in the same way, and left to the weather to prepare it for its casing of masonry. In defiance of experience, the slope of three feet to one was adhered to, and by the middle of 1824, 1241 yards in length of the mass had been raised to the full height of two feet above high water. In November of this year another gale occurred; the tide rose seven feet higher than usual, 796 yards of the work, comprising many thousand tons of stone, were thrown over to the inner side, and the outer slope again reduced to one foot perpendicular for five feet horizontal: below the level of low water no disturbance of the rubble had taken place.

Mr Rennie died in 1821. The Admiralty appointed four gentlemen, two of them the present Messrs Rennie, to inspect the breakwater after the gale, and draw up a report. After careful investigation, they determined to leave the slope at the angle formed by the sea; the centre line of the work was removed thirty-six feet nearer the shore; and the width of the

top reduced from fifty to forty-five feet. Both slopes were to be evenly paved with the largest blocks of limestone and granite, and the top laid at a curve of one foot in its whole breadth, so as to throw off the water readily from the surface. The granite paving was first placed, but was continually undermined and displaced by the waves where it met the low-water line. To remedy this defect, a benching or foreshore of rubble was thrown in, and brought up so as to cover several feet of the granite, to which it afforded complete protection, by breaking the force of the waves before they reached the toe of the paving. Below or above this line but little risk of displacement was to be apprehended. Before laying down the surface blocks, the interstices of the rubble were filled with refuse and screenings from the quarries, to increase the stability; and vent-holes were left in certain parts, to facilitate the escape of compressed air from below. In this way the work has gone on to the present time; and so solid has it become, that it appears to be but one huge stone. Whenever excavations are required, they can only be made by quarrying in the usual way. The fact of the foreshore and lower blocks being thickly overgrown with seaweed, is considered the surest indication of permanency.

The centre line of the breakwater is 3000 feet long, from either extremity of which an arm or kant 1050 feet in length runs off towards the shore at an angle of 120 degrees. Three faces are thus presented to the sea, which have the effect of promoting the regular flow of currents, and preventing the eddies which would have been caused by one straight unbroken line, while the 'inrun' and force of the waves are correspondingly weakened. Two entrances remain for the passage of shipping—the western one being 1600, and the eastern 1000 yards wide, with ample depth of water for the largest vessels, and space for the discharge of alluvium brought down by the three rivers, besides affording means of ingress and egress in all winds. Everything, in fact, that was contemplated by the original promoters of the measure has been accomplished. A safe anchorage is provided without any loss of depth: surveys made so recently as 1845, prove that shoals have neither been formed nor increased.

In the first year of the works, 16,045 tons of stone were thrown down; in subsequent years, the quantity has varied from 4000 to 373,773 tons: the total in June 1847 was 3,620,444 tons. Seventy lineal yards of the eastern arm remain to be finished, which will require 50,000 tons more, making altogether 3,670,444 tons. In addition to this enormous bulk, there are 2,512,696 cubic feet of granite and other stone used in the paving and facings. The cost of limestone laid down on the breakwater is 1s. 10d. per foot, granite 2s. 8d. The blocks of rubble not exceeding two tons in weight were quarried at 1s. per ton; conveyance to the work, and sinking, cost at first 2s. 10d. per ton, but as the contractors gained experience, the charge was reduced. In 1816 it was 1s. 10d., and in 1843-47, 1s. The greatest number of workmen employed at one time was 765; at present there are but 120: masons earn from 3s. to 3s. 6d. per day, labourers 2s. to 3s. The whole cost of the breakwater, when complete, which will be in the course of a year or two, will be £1,500,000.

In the original design of the breakwater, two light-houses, one on each extremity, were contemplated. The erection of a beacon, however, on the eastern arm, has been considered sufficient for the purposes of navigation. This is forty-two feet high, surmounted by a hollow copper globe six feet in diameter, contrived so that a shipwrecked seaman may take refuge within it. The end of the western arm was strengthened by facings of masonry, and finished off in a circular form, to serve as a foundation for the lighthouse, which was finished in 1844. It rises sixty-eight feet above the surface of the breakwater; the lantern is eight feet in height, supported by gun-metal pilasters, and provided with

four refractors, and five tiers containing 118 mirrors. There is, besides, a bell, which in foggy weather is struck a certain number of times every minute by clock machinery. The light can be seen at a distance of eight miles: it is red to seawards, and white when looked at from the land, or within the line of the breakwater.

So great were the protection and security afforded by the breakwater, that vessels of every class resorted to the Sound. A supply of fresh water was wanted to render the benefit complete. This has since been found at Bovisand Bay, opposite the eastern arm. Here the authorities have established a reservoir capable of containing 12,000 tons of water, and erected a pier and jetty accessible at all times of the tide; and water is supplied to any vessel at any time free of charge.

In addition to the breakwater, there is much at Plymouth to repay the traveller for a visit: the dock-yard, extending over more than 100 acres; another, of nearly equal extent, in course of construction for steam-vessels; and barracks, marine and military, for the accommodation of 3000 men. The great victualling establishment built in 1834, we are informed, 'covers a surface of about fourteen acres, which includes all the buildings and machinery for manufacturing and storing flour, bread, biscuit, beer, casks, fresh meat, vegetables, and water; the last distributed by flexible hoses, laid to the principal landing-places and wharfs, which boats and vessels can approach, and thus complete their watering without loss of time.' Three small and imperfect establishments were superseded by this arrangement: they were far apart; when the wind served for one, it was contrary for another: the expense of shipping stores was consequently enormous, especially when required in a hurry. As Sir John Rennie observes, the system ought to have been changed years ago; 'but we go on patching up old establishments, and submitting to the losses arising from them, whereas, with a little courage and determination to apply an effective remedy at once, we should be more than amply indemnified for all the expense incurred in making new and efficient establishments adapted to their several objects.'

ANDREW WYNTOUN, THE CHRONICLER.

AFTER getting tired of the modern poets, with their eternal straining after the transcendental in thought, sentiment, and description, it is pleasant to fall back upon some of the simple bards of bygone ages, who thought of little beyond a clear and faithful recital of events. One of those on whom the *blasé* critic of the present day might have some satisfaction in resting, is Andrew Wyntoun, who lived at the end of the fourteenth and beginning of the fifteenth century, and is only known to have written a Chronicle of Scottish history in verse. It was a simple time, before the revival of learning had spread to this island. The Stuart family was newly seated on the throne. Men alive remembered the wars of Edward III., by which Scotland had been brought to a condition of such distress, that her continued independence looks almost like a miracle. The great men of the country were the nobles, and the leading churchmen, bishops, abbots, and priors: the king was comparatively a weak power. Beyond these exalted classes, all was rudeness and darkness. And yet the people do not appear in general to have been ill off or unhappy. Andrew was himself a high ecclesiastical personage, being a canon-regular of St Andrews, and prior of the monastery of St Serf's Inch, an insular establishment in Lochleven, in Fife.

He tells us that he was requested to write a History of Scotland by a lord to whom he owed service, Sir John of the Wemyss, 'ane honest knight, and of gude fame.' This was a man of old family in Wyntoun's time. If we are not mistaken, its lineal representative still sits in the grand old chateau, which it has occupied since the days of the Maiden of Norway—Wemyss Castle on the Forth. Such instances of permanency may there

be even in a country so harassed by external and civil wars as Scotland has been. Andrew begins before the beginning; for he prefaces his Scottish narration with a sketch of ancient history generally, garnished with descriptions of the ark of Noah and of the spate (still a Scottish word for flood); of how the land of Afrik lies; how the land of Europe lies; and so forth. Even the early part of his history of Scotland is full of monkish tales, which might well have been spared, though it must be admitted they are not always as dull as they are incredible. For example, a notice of some of the wonderful doings of St Serf:—

'In Tullibody ane ill spirit
A Christian man that time tarrit;¹
Of that spirit he was then
Delivered through that haly man.
In Tilllocoutry, till a wife
Twa sons he raised fra dead to life.
This haly man had a ram,
That he had fed up of a lamb,
And used him to follow aye,
Wherever he passed in his way:
A thief this sheep in Athens stall,²
And ate him up in pieces all.
When St Serf his ram had missed,
Wha that it stall was few that wis't.³
On presumption, nevertheless,
He that it stall arrested was;
And till St Serf syne was he brought:
That sheep he said that he stall nought.
And theretill for to swear an aith⁴
He said that he wald not be laith;⁵
But soon he worthied⁶ red for shame;
The sheep there bleated in his wame!
Sae was he tainted shamefully,
And at St Serf asked mercy.'

An awkward sort of miracle this last, surely, yet effectual for its purpose.

Andrew was probably not unlearned after the manner of his age. He makes reference to both Homer and Virgil, to Horace and Ovid, to Josephus and to Valerius Maximus. The entire list of authors mentioned in his book is, however, limited. It fills only a page, and gives us a striking idea of the narrow field on which a literary man of that age was at liberty to pasture his Pegasus. He alludes with respect to his contemporary Barbour, whose metrical life of Bruce is a work of genuine merit. That he was not ill-informed on physical subjects, may be inferred from the explanation he gives of an eclipse of the sun:—

'In the time that the host there lay,
A great eclipse was of the sun.
Therefore folk that was not won⁷
To see sic event as they saw there,
Abased⁸ at that sight they were.
But had they known the cause all
That gar⁹ sic eclipse to fall,
They should not have abasing.
Eclipse is nane other thing
Than when the moon that runs near
Till us, than does the sun by far,
Happens even to come between
Our sight and the sun, that is so sheen,¹⁰
It lets us the sun to see
In as mickle quantity
As it passes betwixt our sight,
And of the sun lets¹¹ us the light.
The sun all time, withouten weir,¹²
Is in the self bath light and clear.'

He is not so enlightened, it must be confessed, on comets.—

The comet appeared that year [1401],
A fair bright stern and a clear:
That stern appearing signifies,
As clerks find in great treatise,
Death of princes and pestilence,
To fall or wede¹³ with violence, &c.

But this was a superstition which lingered long after his day. It is interesting, moreover, to find that this monk of four hundred years ago, while aiming at none of the graces of literature, could pronounce rationally on

the moral affairs of the world. Take as an example his remarks on Fortune:—

'Wha will of Fortune understand,
It is her law to be movand:
She were false, if she should be
Stedfast standing in a 'tree.'¹
Reprieved she should not be forth²
Of falsehood and of treachery,
For till overturn that is above,
Sin' Nature gives her eae till move,
Whiles giving great thing, and whiles small,
Fools to gar trow that she shall
Aye truly in that freedom last;
But when they trust her all their best,
All that is given by that lady,
She overturns it suddenly.'

As a history, the Chronicle of Wyntoun is of course not to be received with implicit credit. Where the general facts, however, can be authenticated from other sources, the details given by Andrew may be adopted as good material for filling up the outline, being generally very minute and graphic. For the century of Bruce and his successors, his history becomes of considerable value, for there he gives many particulars which must have been derived more or less directly from persons who had been eye-witnesses of, and actors in, the events. He himself must have lived close upon the dismal time during which Edward III. ravaged Scotland with a view to its subjugation; accordingly, we find him rich in traits of that period, as where he tells that, from the desolation of the country, the deer waxed numerous, and approached towns without terror. So likewise we may suppose it to have been from immediate knowledge that he described the simple, but well-meant legislation of the warden of Scotland, Sir Thomas Murray:—

'He gart ordain, in that tide,
Wha man that through the land wald ride,
Fra he lighted, he should knit
His bridle fast; and if that it
Happened to be stolen away,
The sheriff of that land should pay
The price of that bridle then,
But¹ lang delay, to that man.
And that, before all other thing,
Allowed should be intill reckoning,
The next count, that that sheriff there
Should give, where halden the 'Chequer ware.
He bade, that ilk² man aise
Should not frae their ploughs ta³
Their plough-irons, but let them lie
On their ploughs, or near thereby;
And if they happened stolen to be,
Till him that aught⁴ them ordained he
The sheriff to pay shillings twa,
And that allowed to be aise.

A greedy carle soon after was
Burning in sic greediness,
That his plough-irons himself stall,⁷
And hid them in a peat-pot⁸ all.
He plained to the sheriff sair,
That stolen his plough-irons were;
The sheriff then paid him shillings twa,
And after that he done had sae,
Soon a great court he gart⁹ set,
Witting¹⁰ of that stealth to get.
The driver he gart, and other ma,
Sae be examined, that soon they
Tald him that the carle them stall,
And hid them in the peat-pot all,
And took syne the payment.
Therefore, by leal judgment,
To the gallowes he gart hari,¹¹
And there he gart hing up that carle.'

In pithiness this could not be excelled, except by the conduct of the warden himself.

Some of the particular actions which took place in the course of the wars are narrated by Wyntoun with no small force and spirit, while it never appears that he has the least wish to exaggerate. There is, indeed, a merit in these parts of his Chronicle, that would make us wonder that it has never been presented in a popular form, if we were not aware how difficult it is to induce the masses to read what they think anti-

¹ Distressed. ² Stole. ³ Knew. ⁴ Oath.

quoted, however wrong they may be in this supposition. In reality, the language of Wyntoun is the English of the present day, with only a few obsolete words and phrases scattered throughout; and when presented, as it is here, in modern orthography, all that is necessary to understand it is to read a little more slowly and carefully than usual. We select the account of the taking of Edinburgh Castle from the English in 1341, as an event interesting in itself, and here, as we think, remarkably well told:—

Worthy William of Douglas
Intill his heart all angry was,
That Edinburgh Castle see
Did to the land annoy and wae. * * *
He thought to cast a jeopardy:
With Wat he treated of Curry,
That purveyed a ship intill Dundae,
And hardy men therein put he.
William Fraser was one of tha',
And Joachim of Kinbuck alae,
And William Bullock, that was then
The King of Scotland's sworn man. * * *
They feigned that they were merchants,
That came there of their own chance,
Out of England, with wheat and wine,
And other sundry victuals. Syne
Till Inohketh they come in by;¹
And this Wat then of Curry
Went to the castle, and can say,
That merchants of England were they,
That had made hither their travel
In that land, with sindy victual;
And, for till have his maintaining,
They wald him send in the morning
A present of victual and of wine;
And, wald he mair, he should syne
Have at his will what he wald buy;
And that the master wald early
Come, and a part of his shipmen,
To speak with him, and bade him then
Let them come hardily him till,
And they should enter at their will. * * *
The shipmen soon in the morning
Turned² on twa horses their flitting;
[Ane] a pair of coal-creels³ [bare],
That covered well with cloths are;
The t'other barrel-ferrers twa;
Full of water als were they,
Before, and they all twelve followand,
Ilk ane a good burden in hand;
And rude frocks on their arming,
To cover them for perceiving,
And all their beards shaven were.
Wat of Curry was with them there,
That convoyed them upward the gait,⁴
And went before them to the yett,⁵
And fand the porter. "Thir are they
The warden spake of yesterday:
Open the yett anon," said he:
Him had been better letten it be.
The meikle yett opened he then,
And he that neist was till him, ran,
And laid him at the earth flatly.
Then a staff took Wat of Curry,
And set under the portcullis,
That come down might it on nae wise.
Syne the coals and creels withal
Upon the turnpike let he fall,
And ane syne blew a horn in by,
Then in the castle raise the cry.
The folk syne sped them to the yett;
But they fand stout porters thereat,
That them rencountered sturdily.
They fought a while right cruelly,
While that William of Douglas,
That in the walls ambushed was,
Has heard the noise and the cry;
Then in the castle hastily
He sped him fast. When he came there,
Fighting he fand that there were;
But he that mellec staunched soon;
And in short time sae has he done,
That the castle he has ta'en,
And vanquished the castellans ilk ane.
Some he took, and some he slew,
And some fled down o'er the heugh.⁶
The yett he gart keep stoutly:
They of the town then come in hy;
Of that winning they were all blythe,
And Scottismen become right swythy.

In preparing this paper, use has been made of the only printed edition of Wyntoun, a very elegant specimen of the typography of Bensley, in two volumes, 1795, which was given to the world under the care of David Macpherson, with a glossary and notes.

THE SORROWS OF A LIEUTENANT, R.N.

I AM a lieutenant in the royal navy. I am on half-pay, and have been so for several years. As it is well known in our service, that nothing short of immense interest, or extraordinary merit, can insure promotion or advancement, a man who expects to get on should marry into some old family, have the command of a dozen votes in an intractable county, or invent some wonderful machine for doing that which human power has hitherto been unable to accomplish. Now it so happens I am unfortunately a married man. To commit bigamy would never do: my first chance of getting on is consequently stopped. With regard to the second means of promotion, I regret to say I am equally deficient, having not the shadow of a vote, or the power of influencing one. I am, however, an ingenious fellow; and the third mode is therefore widely open to me, which will yet serve to make an admiral of me before I die. To tell my tale, however, I must go back to the year 182—, when William, our late sailor king, became lord high admiral of Great Britain. It was a happy moment for us tars: down to the very cabin-boy we all rejoiced. Like triumphant electors, who had just secured the return of their favourite candidate, we naturally felt that we should now begin to look up—that the naval service, which had been neglected for many years, would obtain its fair share of patronage—that the soldiers would not *now* carry away the honours—that 'Britannia rules the waves' would again become a popular air, and brevets prove a little less partial than hitherto. Of all this we received assurance by the pride with which our royal patron donned his admiral's uniform on every occasion, and the pleasure he evidently felt in talking like a British tar. The whole service rejoiced, but none more cordially than myself. I had just been placed on half-pay. Here was a brilliant opportunity for re-entering on active service, and 'winning honours at the cannon's mouth.' I had an invention, a long-perfected invention, one that would have done great credit to, and benefited the service in no common degree. Under the patronage of my own ingenuity, I determined to present myself before our royal chief. For weeks I watched the newspapers, anxiously following him through the course of visits he paid, and the inspections he made. I must confess I thought he was *rather* too fond of reviewing the red-coats, and not quite so liberal as I had expected towards his own brother officers.

At last I heard that our gracious commander had arrived at Chatham, and was about to hold a levee. I bought a new set of uniform (which, by the by, looked like an artilleryman's turn out), mounted my swabs, set my fore and aft, and under the patronage of Sir —, made my first bow to our royal head.

'This is the young officer of whom I spoke to your royal highness,' said Sir —, as I made a sea scrape: 'this is the person I mentioned.'

'Ain't you on half-pay?' quickly demanded the duke.

'I am, your royal highness.'

'Then pray, sir, what do you mean by appearing in uniform?'

I had been told how best to please our chief, so I replied without hesitation—'It is not, perhaps, customary; but I feared to appear, before one so exalted as a lord high admiral, dressed otherwise. If I have done wrong, I trust your royal highness will pardon me for the excess of my loyal zeal.'

In an instant he was mollified. 'All right—all right! What do you want, eh?'

'Nothing save your royal sanction to my invention I am'—

'Yes, yes, I know: a telegraph, an extraordinary telegraph, isn't it?'

'No, please your royal highness. My invention is pumps, by which an immense quantity of water may be drawn up and thrown to any distance required, so great is the force of them.'

'Pumps! pumps! fine things pumps: very creditable, young gentleman, very creditable indeed. Sir —, we must look to this young man. Where are your pumps?'

'They are in London.'

'Go and fetch them directly.'

'They will require some short time preparing.'

'Then what do you want here? What do you bother me for?'

'For leave to submit them to your royal highness's inspection.'

Sir — whispered something in the duke's ear.

'Well, well, that'll do. Bring them to me next Thursday at the Admiralty. Very creditable for a young officer to employ himself so well. Shan't forget you: there, be off.' And I was at once dismissed.

In what blissful dreams of hope did I now depict the almost certainty of employment and promotion awaiting my next interview, not to speak of the fortune I was sure to make. During the ensuing five days, away I trotted as happy as a prince. Loyalty is a delightful feeling: I never felt so buoyant, so happy in my life.

On the following Thursday I was exact to my appointment, and marched into the Admiralty hall with all the pride and consequence of a favoured protégé. I strutted up to the porter, on whom I had hitherto looked with no small degree of respect, but whom I now regarded as the mere menial of higher powers.

'I am come by appointment to see his royal highness.'

'You can't see him,' gruffly replied Cerberus, without even looking up.

'I repeat I come by appointment.'

'You can't see him, I tell you: his royal highness is engaged.'

'I'll wait then.'

'It's no use: I've no orders to admit you. Where are your vouchers?'

'I am an officer in the navy, and I give you my word of honour as such. I come by his royal highness's commands. If you will take my name up, you will see I'm correct.'

'I shall do no such thing: you can't see him; so it's no use talking further.' And the sulky old fellow turned to talk to a knot of flag officers, who were standing by, and who evidently looked upon the porter as a person of considerable power.

'Gentlemen,' said I, appealing to them, 'you will of course have no objection to bear witness to this scene, as I shall most certainly report it.' They bowed. The old porter grinned a sneer at me, and I left the Admiralty mortified, yet determined on having ample revenge.

I instantly went home and wrote an account of the occurrence to Sir —; and the next day, to my great delight, I received a most polite reply, assuring me that my complaint should be attended to; the case would be thoroughly investigated; and that if I called on the Monday following, his royal highness would receive me.

'Bravo, Sam!' cried I, addressing myself—'Bravo, Sam! you're a made man.'

On the day appointed, again I hurried to the Admiralty. No officious porter dared to stop me this time. I was ushered straight into the presence of the royal duke.

'Ah, ah; come about the old story: been saucy, eh? Tell him to come in.' Ere the words were out of his mouth, old Cerberus walked in, no longer, however, the surly overbearing jack-in-office. The mighty were indeed humbled. Crestfallen, he tremblingly approached. 'So, sir, you've chosen to be impudent! Tell me, sir, when you refused to take this gentleman's word, did

you know he was an officer in the navy? Eh, eh, sir?'

'Please your royal highness, I am very sorry. The gentleman—— And here, overcome by emotion and conscious guilt, he stopped short.'

I stepped forward and pleaded for him.

'Well, Mr —, as you solicit for him, I'll pardon him this once. You owe your pardon, do you hear, sir? you owe your continuance in office to this officer's kindness. But now, listen to me: if ever I hear anything of the sort again, although, as I understand, you have been twenty-two years in the service, I'll turn you off at an instant's notice, without a farthing of pension; so now look out. Come, no reply: cut your stick.' And away went the penitent porter. He now turned to me. 'Where are your pumps?'

'Please your royal highness, I have brought only the plans.'

'I want to see the pumps themselves: where are they? Can't you run and fetch them?'

'Impossible: they would take some time packing.'

'Well, then, go and pack them, and bring them here next week, and don't come again without them. Do you hear, sir—eh? Let the next come in.'

I was ushered out, with my pet plans unopened in my hands.

On the levee day following, behold me strutting into the courtyard of the Admiralty, followed by a cart, in which my precious pumps were carefully placed, and two or three shabby-looking assistants, who were destined to unpack them and carry them up stairs. Old Cerberus looked monstrously savage at me, and would not stir from his chair to lend me a hand; but that signified nothing. I had foreseen this, and, as I said before, brought my own men, who removed them from the vehicle, and placed them in a chamber, which the porter sulkily pointed out to me as the one in which they were to be inspected. All this done, I waited half an hour, till his royal highness condescended to come and look at them. After a short nod of recognition, and a significant 'hem,' which rather indicated approval, he suddenly turned to me. 'Pump away, pump away. Let us see how they work. Pump away, sir!'

'I have no water, please your royal highness.'

'No water! no water! Then what did you bring the pumps for, eh?'

'By your royal highness's commands.'

'True, true: but what's the use of them if they won't work? Can't you get any water?'

A sudden thought struck me.

'Please your royal highness, I'll remedy this in a minute.'

I rushed out, and ordered the men who had accompanied me to fetch half a dozen buckets of water. These brought, I conveyed the sock of my pump into one of them, and began to work away. I caused the window to be opened, and to the great admiration of the lord high admiral and the officer that attended him, I ejected the water at least fifty yards into the space beneath. The duke was delighted. He rubbed his hands in an ecstasy, and passed several glorious compliments on me. I was a made man. I wouldn't have given up my chance for the swabs of a post-captain. At last he desired me to let him try his hand. Not content with pumping out of the window, he pumped upon the ceiling, he pumped at the door, he deluged the walls and all around; and as the water sprang back from the force with which it was driven, he continued to applaud the powers of my pump, the utility of my invention. Tired at length with his exertions, he suddenly stopped.

'Here, take these pumps to Sir B. M——: tell him I approve of them highly; say I desire that he'll forthwith report upon them officially. Lieutenant——, you are a very meritorious young officer. Tell Sir B. M—— to communicate his report to me forthwith; and do you hear, sir, come back to me next Thursday?' And with these words he left me, while I hastened to Sir B. M——, who shook me cordially by the hand, assured me of his

readiness to further my interests, and congratulated me on my probable reward.

How I behaved that week I scarcely know. My head was light, lighter even than my purse, and my heart was the lightest of the three. I wrote to every one out of town a long account of good luck; I told every one in town the whole story. I left off boots, and walked in thin shoes, in order to make puns about 'pumps,' and committed a thousand extravagances. I fancied myself already a man of rank and fortune, and spoke of 'Sepings and I——' as the benefactors of the royal navy.

At length the important Thursday arrived. As I walked through the hall with the air of a duke, having instantly been allowed free ingress on pronouncing the magical words, 'by appointment,' I bowed with a patronising air to the now humbled porter. I felt that my own certain exaltation should make me condescending towards others less fortunate. To two or three admirals, whom I had hitherto treated with the most distant respect, I now nodded with a familiar jerk, as much as to say, 'How do you do, my fine fellows?' In a word, I was about as elated and proud as a jackdaw in borrowed plumage, or a peacock with his tail spread out.

This time I was received more graciously than ever. So condescending, so kind was the manner of my royal patron, that I almost began to lose sight of the immeasurable distance of rank which placed him above me. His encouraging manner, as he assured me Sir B. M——'s report had been most favourable, sent me up to the seventh heaven in a fit of ecstasy seldom equalled.

'And now, sir, how shall we begin with this experiment?'

'May it please your royal highness, the best mode will be to have a set of these pumps fixed on board a man-of-war, to give them a fair trial.'

'Perfectly true: it shall be done. You will of course see them fitted yourself?'

'Yes, your royal highness, I should like that.'

A pause in the conversation occurred; I ventured to interrupt it.

'On which of the vessels shall I place them?'

'In one of the first that are about to sail.'

'I cannot do this without your royal highness's order.'

'I will give one.'

'But, please your royal highness, at which dockyard am I to get them fitted?'

'Which you like. But run away now: don't you see I'm busily engaged? Do you want anything more?'

'Merely a treasury order, your royal highness, for the expenses.'

'Sir!' cried the duke, starting up.

'The mere expense of placing them. I shall not ask anything for my own trouble, your royal highness, till they have been proved.'

The duke's manner changed.

'You will cause them to be put up at your own expense.'

'My expense, your royal highness! Impossible! I am only a poor lieutenant on half-pay, without a sixpence to bless myself with, anxious only to benefit the service.'

He interrupted me. 'Benefit the service indeed! and wont pay for your own trumpery! Here you come every day bothering me with your pumps, worrying my heart out, and then wont pay for their erection! Hark ye, sir, pack up your traps there (pointing to my plans, which I had laid before him), pack them up quickly, and be off; and never let me clap eyes on you again as long as you live. Be off, sir, with your pumps!' And without condescending again to look at me, he turned his back, leaving me to hurry from the room, crestfallen and abashed, my glories vanished, my pumps despised!

A year or two passed over. I hid my silent griefs in a country town. I tried to forget my unlucky pumps, and retrieve my extravagances during the week of my

delusion. By degrees I began to get over my disappointment, and was more than half determined to give up the naval profession, when one fine day I learned that our late commander had suddenly become our 'Sailor King'; that blue jackets had come into fashion; that his majesty always wore an admiral's uniform in preference to any other dress; and that he had been heard to declare, now that he had the power, he would once more restore the glories of the 'wooden walls of old England.'

Again my hopes revived. My excellent invention once more rose to my view. No niggardly excuses could now intervene to crush them. I hurried up to London, and ordered a full suit of regimentals (for our gracious sovereign had suddenly, in his great interest for our service, changed our facings, and given us a uniform closely resembling the artillery), and having secured an introduction, hastened to one of the first levees of our naval society.

My heart fluttered in my bosom as it came to my turn to advance. I did so with no little agitation. I felt how much depended on the future opinion of my king. My name was lowly muttered. I made one step forward. Fortune, that arrant jade, placed something in my way. To this very moment I cannot say what it was; but some object or other either caught my foot, or got between my legs, or those limbs refused their office, or—but it matters not what the cause was, I fell down sprawling on the floor. The good-natured monarch took one pace towards me, and actually held out his hand to assist me. At this moment I raised my head: he espied me, and suddenly recoiled, as if bitten by an adder. 'Take him away, take him away!—it's that fellow with his pumps again;' and I was led out amidst a general titter, the word 'pumps' still ringing in my ears.

From that hour to this I have never again visited court, or looked at my unfortunate invention; studiously avoiding the presence of my superiors in the Admiralty, lest I should chance to inherit the sobriquet of 'Monsieur Tonson, R. N.'

TRAITS OF THE PENINSULA.

THE two countries of the Peninsula are in one respect the least interesting in Europe. The political and military convulsions that elsewhere excite, only disgust and confuse in Spain and Portugal. We are wearied by their monotonous extravagance, and turn away with contempt from the ceaseless spectacle of rebellion without patriotism, and loyalty without common sense. But for this very reason the character of the people is an important subject for philosophical inquiry, although one, unluckily, that has been but little treated by competent observers. In such an inquiry, the book now reprinted by Lord Carnarvon* will be found of considerable value—but only as materials. It is a lively, gossiping, amusing production, full of sketches of manners, and stories of forgotten feuds, with a thread running through it of personal adventure, which gives something like the charm of romance to the whole. Avoiding the politics as stale, and even the hairbreadth 'scapes of the author, we shall devote a few columns to those details which bear most upon the character of the people.

The following is the general opinion of our author:—'If I could divest myself of every national partiality, and suppose myself an inhabitant of the other hemisphere, travelling solely for my amusement, noting men and manners, and were asked in what country society had attained its most polished form, I should say in Portugal. This perfection of manner is perhaps most appreciated by an Englishman, when seen in that portion of the aristocratic class which has adopted in minor points the refinements of the first European society,

* Portugal and Gallicia, with a Review of the Social and Political State of the Basque Provinces. By the Earl of Carnarvon. Third edition. London: Murray, 1848.

and has retained the spirit, while it has in some degree dropped the exaggerated ceremonial, of the old Portuguese courtesy. Portuguese politeness is delightful, because it is by no means purely artificial, but flows in a great measure from a natural kindness of feeling. He then comes to particulars; asserting that in Portugal the infliction of pain in conversation is not only disagreeable to both parties, but a proof of ill-breeding in the aggressor. A man will not even show that he is aware of being deceived by the person he is conversing with, for fear of hurting his feelings! This is surely the *ne plus ultra* of politeness; and after hearing of it, we are not surprised to be told that in Portugal society resembles a vessel impelled by a favouring breeze over a calm sea, undisturbed by any displeasing inequality of motion.

'The restless feeling so often perceptible in English society hardly exists in Portugal: there are no ardent aspirations after fashion; there is little prepared wit in Portuguese society; and no one talks for the mere purpose of producing an effect, but simply because his natural taste leads him to take an active part in conversation. In spite of manners apparently artificial, society is more unaffected in Portugal than superficial observers would at first suppose. Dandyism is unknown among their men; and coquetry, so common among Spanish women, is little in vogue among the fair Portuguese. They do not possess to the same extent the heady passions and romantic feelings of their beautiful neighbours; but they are softer, more tractable, and equally affectionate.' These women, however, though naturally lively, witty, and observant, have but little conversation, in the proper sense of the term, and can only be properly appreciated by those who form part of their own circles. This characteristic politeness 'appears in the intercourse of the higher with the middling and lower orders, and softens the natural jealousy arising from the distinctions of rank. An English gentleman, unprovided at the moment with money, sends a beggar to the devil; the sovereign of Portugal calls him his brother, and regrets that he has nothing to offer him. The pride of the Portuguese *fidalgo*s is chiefly directed against each other, and usually relates to their family alliances. A *Puritano*—that is, a *fidalgo* who traces a purely noble descent from the earliest times—is supposed to form an unequal alliance when he unites himself to the scion of any house, however illustrious, if not also a *Puritano* by descent. The higher will not ally themselves to the inferior nobles, and these again will form no connection with the commonalty. But precedence of rank is occasionally superseded in public opinion by ancient birth; and some untitled families have constantly refused to marry into the houses of particular *grandezes*, because their own descent is unquestionably more ancient, and therefore considered more illustrious.'

But the kindly flow of Portuguese society is only seen in the lowlands, and in the larger congregations of the people. In other parts of the country we find something very different. In the *Traz os Montes*, for instance, 'the stately manners which characterised the nobility of the feudal world are still sometimes retained among the families of the great. I have said that a strong feeling of vassalage exists in their dependants; a haughty sense of superior birth divides these nobles from the rest of society: even in the bosom of their own families, and where their nearest affections are engaged, a solemn and somewhat unbending spirit marks their social habits; indeed, where the old ancestral forms are kept up in their ancient rigour, the children of the house inhabit separate apartments in the distant wings of the old rambling mansion, and long after the period of adolescence has elapsed, receive on bended knees the blessings of their parents. They are not permitted to take their meals at the same board with their parents, and must not remain covered in their presence, or even sit down without express permission. But although the familiar habits of modern life have not invaded

those ancient and patriarchal halls, still where these forms—the legacy of a primitive and wholly different age—are thus inflexibly maintained, it may be observed that the essence of the old Portuguese honour is, generally speaking, preserved equally inviolate, and the slightest falsehood or deceit is held in generous disdain.

'But however strict the forms occasionally maintained in these antiquated establishments between parent and child, a graduated subordination of respect appears to pervade the household; a similar homage is exacted by the children from those beneath them, and a similar state observed. In many great families, the young lady of the house, even when she merely goes out to take the air, is preceded by the *escudeiro*, or shield-bearer of the family; though he now no longer carries the shield, but only walks a few paces in advance of his charge, with a solemn and measured step, bareheaded, and holding his hat humbly in his hand. These shield-bearers, attached to noble families, were formerly, like our ancient esquires, gentlemen by birth, though for the most part greatly reduced in circumstances.' The humility of servants, however, is conjoined with an extent of familiarity from which the pride of the English—among whom no such humility prevails—would revolt. 'A servant standing behind his master's chair corrects his statements if he considers them erroneous, and not unfrequently makes observations on any question under discussion. A *grandez* of the kingdom attempted to combine the dignity of his elevated station with the national habits of familiarity towards his domestics by a whimsical mode of proceeding; for he invited them to join the family circle at cards, but required them to remain on one knee during the whole of the game.'

This *grandez*, however, was an exception. The kindly feeling between the family and the domestics is general throughout the country; although persons of rank are proportionately rigorous in questions of ceremony with each other. In illustration of this latter peculiarity, the following amusing anecdote is told by our author:—

'I called one morning on a high dignitary of the church, and ascending a magnificent staircase, passed through a long suite of rooms to the apartment in which the reverend ecclesiastic was seated. Having concluded my visit, I bowed and departed, but turned, according to the invariable custom of the country, when I reached the door, and made another salutation; my host was slowly following me, and returned my inclination by one equally profound; when I arrived at the door of the second apartment, he was standing on the threshold of the first, and the same ceremony again passed between us; when I had gained the third apartment, he was occupying the place I had just left on the second; the same civilities were then renewed, and these polite reciprocations were continued till I had traversed the whole suite of apartments. At the banisters I made a low, and, as I supposed, a final salutation; but no: when I had reached the first landing-place, he was at the top of the stairs; when I stood on the second landing-place, he had descended to the first; and upon each and all of these occasions our heads wagged with increasing humility. Our journey to the foot of the stairs was at length completed. I had now to pass through a long hall divided by columns to the front door, at which my carriage was standing. Whenever I reached one of these pillars, I turned and found his eminence waiting for the expected bow, which he immediately returned, continually progressing, and managing his paces so as to go through his share of the ceremony on the precise spot which had witnessed my last inclination. As I approached the hall door, our mutual salutations were no longer occasional, but absolutely perpetual; and ever and anon they still continued, after I had entered my carriage, as the bishop stood with uncovered head till it was driven away.'

A Portuguese gentleman never quits an apartment, after having taken leave, without turning round at the door (as actors do on the English stage) to make a parting

obscure to the ladies; and this is expected by them as a matter of course, and gracefully responded to. 'When upon any occasion,' says our author, 'a Portuguese tender his arm to a lady, he is bound to proffer his left arm, on the chivalrous principle that the heart, the seat of the affections, should be placed as nearly as possible in juxtaposition with the fair being to whom, for the moment at least, the homage of its possessor is due.' Why, then, is the right arm offered in most other European countries? Because, we shall be told, it is the best. The writer of these paragraphs had once the misfortune, through momentary inadvertence, to tender his left arm to a Russian lady of a much higher rank than his own, for the purpose of leading her to the dining-room, when she started back as if he had struck her in the face, and sweeping round with the air of a tragedy queen, took hold of his right arm. An English or a French lady, he ventures to think, would have attributed the solecism either to ignorance or forgetfulness, and have accepted with a smile what was offered to them, without making any fuss about the matter.

Ceremony, however, interposes its chilling effect only in the higher circles of Portuguese society: elsewhere there is a delightful simplicity, which reminds one of what provincial Scotland was some quarter of a century ago. 'In the evening, I accompanied a friend to a party at the house of a Portuguese lady. She had two daughters, the eldest a pretty person, with pleasing manners, and extremely well informed, the youngest a very decided beauty. The party were playing at blind-man's-buff when I entered; a game in which, as it is played in Portugal, success depends upon the rapid recognition of different persons by their voices. Being immediately required to take a part, I was blindfolded, and placed in the centre of the ring. I first, however, pleaded ignorance of every individual present; upon which the lively beauty led me round the circle, hastily naming every person—an ingenious operation, which did not much assist me, as I could not bear in mind a volley of names which I had never heard before. However, trusting to chance, I began my career, and soon touched a lady with the wand. I asked the regular question, and was answered in the feigned voice as regularly assumed. "Whom have you found?" was the general cry. I paused. "Well, but mention some one; the game is at a stand-still." But I could specify no one. I looked stupid, and my new friends probably thought me profoundly so: at length, by a prodigious exertion, I was delivered of a name, but it did not enlighten the party; and I afterwards discovered that the name I had given was a compound of two or three others, which had become most egregiously mixed up in my puzzled brain. This attempt having proved unsuccessful, I exclaimed, "*La dame qui est habillée en noir.*" "*Mais nous sommes toutes habillées en noir,*" was the perplexing reply. At length I named the eldest demoiselle of the house. "No, it is not; it is C—," said the young beauty, naming herself in a lively tone of mock reproach, perhaps a little displeased that so soft a voice once heard should not be immediately recognised. We played several other games. Every lady was required to sigh for a particular gentleman, who in turn was called upon to sigh for a lady, and generally felt bound in gratitude to mourn for her who had mourned for him. This reciprocal grief was very diverting. As might naturally be expected, a sigh is rarely bestowed on the real object of the mourner's affection. So closed an evening of uninterrupted good-humour.'

The 'calm flow of society' in Portugal (when interrupted by religion or politics) appears to depend upon the calm flow of individual feeling. This may be broken, occasionally, and exhibit all the phenomena of emotion; but in an instant the confusion is over, and everything is as placid as before. Our author tells a story on this subject—a romance, if you will call it so, but still a Portuguese romance—where excitement is expected, but never comes.

'Soon after I left Ovar, I overtook a young woman, of great personal attractions, journeying to Oporto, attended by three servants. I greeted her, according to the custom of the country; and as we were travelling on the same road, we naturally fell into a conversation, which she kept up with liveliness and spirit. Her servants were barefooted: they wore a red sash, a laced jacket with rich silver buttons, a large hat, and earrings of solid gold. The curious mixture of familiar dialogue and good-natured authority which characterised her intercourse with them, seemed to realise the description of the Grecian dames amid their handmaids: other circumstances contributed to keep up the illusion. Her regular and noble features reminded me of those beautiful models of ancient art with which no modern sculpture can bear competition. Her costume might in some degree be considered classical, and was admirably adapted to set forth the faultless outline of her face. She stopped at a friend's house near Oporto, and we separated; but we afterwards renewed our acquaintance, and I heard from her own lips the story of her life—a simple but romantic tale. It is but short, for she was still very young.

'She became acquainted, at the early age of sixteen, with a young man, only a few years her senior, but greatly her superior in rank. Acquaintance gave birth to attachment, and the difficulties which prevented their union heightened that feeling into the most ardent love. Her lover's family contemplated the possibility of such an event with dread; but her father encouraged their intercourse, and the plighted couple met every evening under the shade of the garden fig-tree, and exchanged vows of eternal fidelity. The impetuous but resolute attachment of her young admirer at length appeared to overcome the opposition of his family; and he arrived one evening at the trysting-place in high spirits, and entertaining sanguine hopes. They spent a few delightful hours in the full enjoyment of reciprocal confidence, and separated with the belief that they would speedily be united, to part no more; but from that hour they never met again either in sorrow or in joy. Her lover's father, anxious to avert from his family the disgrace of an unequal alliance, had appeared to relent, for the purpose of executing his designs with greater facility. He had already conferred with the civil authorities, and that very night his son was arrested, and conveyed to a place of strict confinement, where he was seized with an infectious fever, of which he died in a few days, in spite of every exertion to save him.

'She married two years afterwards, and confessed to me that she was perfectly happy. A prior attachment sometimes continues to exist in a woman's mind long after marriage; but except in a person of very deeply-rooted affections, rarely survives the birth of a child: from that hour the current of her thoughts becomes changed; new duties, new feelings, new hopes arise, to banish former regrets, and

"She who lately loved the best,
Forgets she loved at all."

'I observed in my pretty heroine a striking instance of those sudden bursts of quick and sensitive feeling which seem inherent in the southern temperament. Although she spoke of her first ill-fated lover with calmness, almost with indifference, and confessed that she had long ceased to regret the difficulties which prevented their union, yet once, as she dwelt upon past scenes, and recalled a thousand instances of his boyish devotion, her voice changed, her dark eyes filled with tears, and her whole soul seemed to revert, with undiminished affection, to the object of her early love. Her emotion was but transient; yet I am convinced that, while it lasted, she would have renounced every earthly tie to be restored to him who had been the first to win her affections, and was then mouldering in the grave.'

The word romance draws our attention to another bit, a brief incidental picture, which Scott would have considered as capital materials. The noble author, ar-

rested by the royalists, and travelling under the escort of soldiers, has arrived at a small village, where the party halt for the night in a ruinous building. Here they sup upon black broth and bread of the same colour, and after this refection, draw in around a roaring fire, to amuse one another with stories of sorcerers and banditti. 'The night was far advanced, when a loud knocking was heard at the door; two servants being admitted, announced the approach of their mistress—the most influential person in the immediate neighbourhood. Directly afterwards, she appeared, followed by a train of domestics, and evidently decorated to the utmost advantage. Her dress was extremely antiquated, but had been gorgeous in days of yore; it was, I have little doubt, an heirloom in the family, and had probably been worn by herself, and by her maternal ancestors for some generations past, on every solemn occasion. The soldiers received her with every demonstration of formal respect. The stately dame began by saying she had only just been informed that a party of troops engaged in the royal service were quartered in a miserable building near her house. She expressed her hopes that no circumstances displeasing to his majesty's government had given rise to such an unusual occurrence; she trusted her devout aspirations on this head would be confirmed, but at all events esteemed it the bounden duty of a loyal subject to congratulate the troops on their safe arrival, and to assure the individual intrusted with the command that the loyalty which had ever distinguished her family had suffered no diminution in the person of their actual representative. She concluded by declaring that her house, her grounds, and all her goods were at the entire disposal of the king's troops as long as they remained in the neighbourhood. The sergeant answered in a strain as formal and polite, and in language far above his station: he thanked her for the affection which she bore the royal cause, and for this mark of attention to his majesty's servants. He spoke in gratifying terms of the proverbial loyalty of her house, and wished that his majesty possessed more supporters, true-hearted as herself, in these degenerate times, when in too many instances the son had fallen away from his father's faith. He touched lightly, and with address, upon the object of the expedition, and concluded by declining her offer of accommodation, as the night was far spent, and his troops were obliged to renew their march at break of day. A profusion of parting compliments were then exchanged, which, time and place considered, were rather entertaining. The door was then opened

—"Wide and high,
To let the queen and her train go by."

Two menials went forth in advance to clear the way, and after them paced forth the pompous dame; then all her attendants followed; but it must be confessed, their ragged attire spoke ill for the fortunes of the loyal and illustrious line. This scene reminds one of Lady Margaret Bellenden and 'his most sacred majesty'; but the Portuguese adjuncts, as the reader may gather from the context, render the above much more striking. The ruined hut, the wild features and picturesque costumes of the soldiers, muleteers, and peasants, basking in the ruddy light of the fire, and rising with the politeness of the country to receive their distinguished visitor—all serve to throw an air of romance over an incident which would otherwise have been merely ludicrous. The dresses of the bystanders may be taken from another page:—"The strange wild figures that meet the eye in some of the sequestered parts of Spain, and recall the memory of another age, are not here to be seen: here, indeed, we do not see the pilgrim in his partycoloured garment, the courier with his breast of fur, bare neck, and waist encircled by a belt crowded with quaint devices rudely traced, as if to guard the wearer against a host of Gouls and Afrits. These uncouth figures do not in this part of the country startle, yet delight the eye by their grotesque appear-

ance; still there is much beauty of costume: the men were attired in satin waistcoats, richly figured, and of a crimson colour; some had handkerchiefs tied round their heads, after the Oriental fashion, but not in the graceful folds of the turban, as I have seen them worn in that paradise of the Christian world—the Vale of Murcia. Many of the boys, and some of the men, were dressed in a loose garment, resembling in form, but not in beauty, the Highland kilt; and a broad-brimmed hat, a red scarf, and a blue jacket, not worn but thrown over the shoulder, complete the provincial dress. They also carry the *pao*, or long pole, as in the neighbourhood of Lisbon.'

The stories with which the night was whiled away on this occasion related to the spectral wolves common likewise in Breton superstition, and to a more original band of robbers, whose magical number—thirteen—was never diminished even by the death of one-half of the band. It mattered not what casualties they met with, what troopers they lost, when they were mustered after the fray, the force was undiminished and thirteen voices answered to the roll-call! Another singular superstition is described in a later page:—"I was ill and shivering, though the evening was really warm; I therefore gladly established myself in the kitchen for the sake of its roaring fire. The room was spacious and imperfectly lighted, the chimney huge, and the roof high and pointed. Here I observed a man of singular appearance, sitting apart, not speaking himself, or spoken to by others. His face was pale and haggard, his eyes deep sunk, and his hairs were prematurely gray.

'The Borderer whispered in my ear that he was one of the dreadful Lobishomens—a devoted race, held in mingled horror and commiseration, and never mentioned without emotion by the Portuguese peasantry. They believe that if a woman be delivered of seven male infants successively, the seventh, by an inexplicable fatality, becomes subject to the powers of darkness, and is compelled on every Saturday evening to assume the likeness of an ass. So changed, and followed by a horrid train of dogs, he is forced to run an impious race over the moors and through the villages, nor is allowed an interval of rest till the dawning Sabbath terminates his sufferings, and restores him to his human shape.

'If, therefore, a peasant chance to meet a pale and weary traveller at an early hour on a Sunday morning, he shudders, and in fancy sees the traces left by the infernal chase upon the stranger's haggard countenance. A wound inflicted upon the poor victim of this unhalloved agency during the very act of transformation, can alone release him from this accursed bondage; a liberation supposed to be most rarely effected, because few men have courage to behold the appalling change in progress, and still fewer have sufficient coolness to strike the critical blow at the exact moment. Such is the superstition of the Lobishomens, diffused more or less over the whole of Portugal, but subject to different versions in different districts, and only credited implicitly in the wild and lonely wastes of Alentejo.'

We have now done. Our notice is a thing of shreds and patches—just like the book; of the amusing parts of which it may be taken as a fair specimen.

WAR.

The operations of genuine war may bear a triumphant aspect; but that is only the fair disguise with which men cover the gravest and saddest of human intentions.

SUMMER EXCURSION IN GERMANY.

MUNICH TO LINZ.

COUNT RUMFORD, or—to call him by his original and unsophisticated name—Benjamin Thomson, has left the impress of his masculine intellect in various institutions in Munich. It will be recollected that this ingenious and enterprising person, when expelled by political intolerance from America, found an honourable refuge at the court of the Elector of Bavaria, and was permitted by him to remodel various educational and criminal establishments. By this means Munich may be said to have got the start of other continental cities in some of its social features; and till the present day, it keeps pretty much ahead of them. It is agreeable to find that in a place where the fine arts have met with so gracious a friend and patron as Ludwig I., and which is rapidly growing up a cisalpine rival of the famed Italian cities, an enlightened and humane policy is pursued with regard to those momentous subjects—pauperism, education, and crime.

What came under my observation as respects the reform and punishment of criminals, was so unlike anything I had previously seen in prison arrangements, that I deem it worthy of special remark. Taking a calèche and guide, I drove to a spot outside the town, to see the great central prison of Bavaria, in which were confined nearly five hundred détenus. The establishment did not, however, look like a prison. Formerly used as a monastery, it consists of a cluster of detached buildings, interspersed with courtyards, the whole occupying a considerable space of ground. Soldiers walked as sentries around the walls and within the courtyards; but beyond this, there was little appearance of force, although the strictest discipline was maintained. A stream of pure water, led apparently from the Isar, flowed through the premises, insuring cleanliness, and furnishing what water was desirable for economic purposes. Without any other introduction than the presentation of my card, and a few words spoken to the governor—a gentleman in a military dress—I was politely conducted through the establishment, and every required information afforded. The principle on which the prison is conducted differs entirely from that which is now extending itself over Great Britain—the seclusion of individuals separately in cells. It is the imprisonment of persons together in apartments, but all under the obligation of silence—or, at the utmost, free to converse only on certain subjects—and all kept hard at work by superintendents. That there will be improper communication with each other by such a plan, is evident; but placed under judicious regulations, I would not anticipate serious evils from this species of association; and at anyrate, it is a question if the separate system, which is clearly a vio-

lation of nature, is in all respects preferable. One thing is certain, there was much more cheerfulness in this Bavarian prison than I had been accustomed to see in houses on the Pentonville principle; and I am inclined to think that without cheerfulness there can be little virtue. Not driving at any fine-spun theory, the Bavarians have, to all appearance, tried what work will do in the way of reclamation. The prison is a factory, in which the greater number of détenus labour in bands at the various branches of the manufacture of cloth. Some are attending carding-machines, others are dyeing, spinning, weaving, and performing the finishing processes; the result being a fine light blue fabric, which is used for clothing the army. Another branch of employment is the manufacture of linen, which engages many hands; and the cloth, when finished, is done up with as much taste as is usual with our finer Irish linens.

Besides these staples, other trades are carried on, chiefly to meet the wants of the establishment. There were smiths' and carpenters' workshops, stocking-weaving, and shoemaking. In the large kitchen, I found several men-cooks, dressed in the usual snow-white costume of the continental cuisine, and who were détenus like the others. Some soup and pudding were offered to me to taste: as it was Friday, I cannot say the specimen would have exactly suited the palate of a Pentonvillian.

The greater number of the prisoners are men; and there are included amongst them convicts condemned to a long imprisonment, and for life. Capital punishments are not abolished in Bavaria; but they rarely take place, and only for murder under greatly aggravated circumstances. I here saw twenty men at work in a room by themselves, who had been convicted of murder, and were condemned to imprisonment for life. Their employment was carding flax with hand-cards. The appearance of these men, dressed in a prison garb, with heavy clog shoes, and manacles on their legs, was not pleasing. Their looks were downcast and subdued, and I could fancy that they felt the humiliation and misery of their situation. Yet, all things considered, their condition was creditable to the country, and an advance on the treatment of a similar class of criminals in England. In the department for female détenus, there were pointed out several women also condemned to imprisonment for life. One, a young woman, engaged in some laundry work, had been convicted of killing her child. As crimes of this atrocious nature are usually committed in gusts of passion, in which the actor can scarcely be said to be an accountable being, how much more reasonable and humane to confine for life, under proper restraints, persons of this unfortunate class, than to strangle them amidst the yells of a depraved and horror-loving multitude! On quitting

the prison, I learned, by a few words from the governor, that all that a prisoner of the ordinary class gains by labour over a certain sum, is placed to his credit, and paid to him at the expiration of his term of imprisonment. Few, he said, come back for second offences; 'one visit was usually enough.' I returned to Munich, much pleased with what I had seen and heard; and not without some misgivings as to the alleged superiority, in all circumstances, of the Pentonvillan system of discipline—the truth being, that as yet all systems of prison treatment are tentative, and possibly a century may elapse before we arrive at the solution of the problem.

Having exhausted Munich, we bade farewell to its many interesting objects, and proceeded on our journey towards Vienna. It was immaterial how we went; but as it was possible to take Salzburg by the way, we adopted a route which would bring us to that ancient town. The distance to Salzburg was eighty-two miles; and sleeping for the night at Wasserburg, an ancient town on the rapid-flowing Inn, we were able to reach it by voiture in two days. On quitting Wasserburg, we were getting towards the frontier of Austria, with the lofty peaks of the Tyrol on our right, the country around which is well wooded, being mostly arable, and studded with numerous villages. The houses were for the greater part of wood, some with fancifully-carved gables to the road, and all less or more decorated with sentences from Scripture, carved in the old German character.

Before crossing a wide stream, which, swollen with a late heavy rain, hurried perturbedly on its course from the Tyrolese mountains, we were brought to a stand at the office of the Austrian douane. English guide-books speak of such rigorous examinations on entering Austria, that I made up my mind to half an hour's overhauling. To our surprise and satisfaction, however, the scrutiny was exceedingly superficial: a number of books—said to be proscribed articles in Austria—which lay on the top of our portmanteau, were not even looked at; and with passport *visé* we were in a few minutes pursuing our journey. Were we to enter the country now, while the continent is in a state of agitation, I doubt not we should experience a somewhat different treatment.

We had been gradually approaching the mountains on our right, and now entered the vale of the Salza, up which we were conducted for a few miles, till the hills closed in around; and at a turn of the road, the very curiously-situated town of Salzburg burst into view. In a quarter of an hour afterwards, we were lodged at a hotel at the centre of this walled and ancient city, our windows looking out on a central square or place, in which was situated the cathedral, and the old archiepiscopal palace, transformed into a barrack for Austrian soldiers. Salzburg is reputed to be the most picturesquely-situated town in Germany. It is certainly a strange huddle of buildings, crowded within a kind of ravine, and with scarcely standing-room on the banks of the Salza, which, wide, deep, and of a milky hue, rushes through the town at a speed setting navigation at defiance. The greater part of the town is built on the left bank, and this portion is backed by a high rocky knoll, on which grimly stands the castle of Salzburg. The face of the hill, on the right bank, spreading away above and beyond the houses at its base, is beautifully dotted over with woods, villas, and gardens, and commands a fine view of the opposite castle and the valley behind it. The two portions of the town are connected by a wooden roadway, fastened on boats, which are anchored in the stream—a simple unexpensive species of bridge common in continental countries, which we might imitate with advantage in various situations. The sight of Salzburg, with its castle and environs, suggests recollections of Scottish scenery. Wilkie, in speaking of the spot, says—'It is Edinburgh castle and the Old Town brought within the cliffs of the Trosachs, and watered by a river like the Tay'—a remark worthy of this ingenious artist.

Out of the way of general traffic, conquered, and held down, Salzburg may be said to be merely the ghost of a city—the dull tomb of a listless population. Formerly the seat of an archbishop, who was also an independent prince, it was, without a shadow of justice, taken possession of by Austria, of which it is now a poor provincial town, with a garrison to keep it in order. The houses are generally massive and grand; monasteries and churches are seen in all quarters; while palaces of ecclesiastical dignitaries, faded and dull in aspect, give shelter to regiments of foot and cavalry. On the morning after our arrival, and with a written permission from the commandant, we climbed the hill to the castle, where, at a height of two hundred to three hundred feet above the Salza, the toil of our ascent was rewarded by a view rich, varied, and pleasingly picturesque, though limited on nearly all sides by the peaks of the not far distant mountains. Having penetrated through several storeys of a building occupied by soldiers, we arrived at a suite of apartments containing a few antique objects; and here we were indulged with a view of the torture chamber, in which a wooden machine or rack, for raising prisoners with weights at their feet, still remains as a thing to interest travellers, and as an evidence of the means once adopted to punish religious contumacy. Beneath is a dungeon or oubliette, accessible only by a trap-door, the dismal receptacle of the unhappy victims of the misjudging religious tribunal which held its sittings in the castle. Shall we break into a fume of indignation at seeing these indisputable evidences of ecclesiastical oppression? Alas! does not the history of all nations reveal tyrannies equally horrible? Coming from a country where nonconformity and the impossible crime of witchcraft were alike punished with the stake, it behoves us to pass over in silent sorrow these memorials of a frailty common to unenlightened human nature.

The rocky protuberance on which the castle is situated has all the appearance of being the remains of a hill which had once blocked up the valley of the Salza, and been reduced to its present irregular form by the action of the water. It is composed of a species of rock which is peculiarly susceptible of assuming new forms when exposed to meteoric influences. At a level somewhat lower than the spot occupied by the garrison, the knoll extends in one direction with an irregular surface, forming a sylvan scene of wood and green fields, open for the recreation of the inhabitants. As if to show that the former rulers of Salzburg were not all mere oppressors, an undertaking of great public importance, executed by a prince-archbishop, is here pointed out, and we descended from the hill to examine it. This is a lofty and spacious tunnel, upwards of four hundred feet in length, which has been cut right through the rock at the level of the streets, so as to admit a free and convenient communication for foot passengers and vehicles between the town and country beyond. A bust of the benevolent ecclesiastic, Archbishop Sigmund, who executed this useful public improvement about eighty years since, is placed over the entrance.

The finest thing about Salzburg is the vale, which spreads its richly-clothed fields behind the castle, and over which a delightful drive of eight miles conducts the tourist to the salt mines of Hallein. We spent a whole summer's day in visiting spots of picturesque beauty and historic interest in this charming plain, the limit of our ride being the newly-built château of Neftin, erected in the midst of a small lake, but accessible by a bridge from the land. I am sorry it is not in my power to throw any light on that archaeological mystery, 'château-life,' in consequence of our visit to this imitative mediæval mansion; for the house was still in the hands of the workmen, and our curiosity was necessarily confined to an examination of the freshly-executed frescos which decorate its walls. From the leads on the highest turret, we had a fine view of the wooded environs, overhung by lofty alpine heights, which even at this advanced season were plenteously covered with snow. On

the way back to Salzburg, we visited a manufactory of articles in marble—pedestals for statues, columns, and other objects, which are transported hence to different parts of Germany. The machinery for sawing and polishing the blocks is moved by a stream which dashes from an adjoining height. At a little distance, and higher up the hill, within the recesses of a most picturesque ravine, we were shown a more novel and curious operation: this was the making of boys' marbles; and a more simple process can hardly be conceived. Small pieces of marble being put into a peculiarly-shaped stone trough or dish, a top of the same material, fitting into certain grooves, is made to whirl about by little streamlets led from the main torrent, and the marbles are soon ground into a spherical form. There were about twenty of these little sputtering mills, one above another on the stream, so that the scene was busy and amusing. At a glance, we were let into the secret of cheap pebble-grinding in Germany. No expense whatever had been incurred in constructing the mills: the apparatus was of the homeliest kind; the sluices on the impetuous streamlets were each nothing more than a turf; the raw material came out of the hill-side; and the superintendent of works was a female, who probably considered herself well paid at a remuneration of twopence a-day. And from this primitive manufactory boys' marbles are sent in vast numbers all over the world.

Every town is glad to have something peculiar to boast of, if it be nothing more than a happy knack of baking buns or gingerbread. Salzburg boasts of having produced Mozart; and the house in which he was born (1756), being the third or fourth floor of a large and handsome building in one of the main streets, is pointed out to all strangers as an important curiosity, which it is expected they will visit. If any town could rationally derive merit from being the birthplace of genius, Salzburg would assuredly be entitled to occupy a high place in the world's consideration; for of all the marvels of precocity in musical science, Mozart is the most marvellous—his taste and skill in composition the most remarkable. His statue, in bronze, ornaments the Michael's Platz.

At the end of two days we had seen all that appeared interesting in this ancient city, and then proceeded with our private conveyance to Ischl by St Ghilgen (the *gh* guttural). The road was hilly, and disclosed scenery of the greatest beauty. St Ghilgen is a small town situated at the end of a lake, which I should think is about five miles in length; and the view of this sheet of water, with its projecting woody promontories—St Wolfgang, with its church at the farther extremity, and the craggy steeps around, towering to the clouds—is one of the finest things of the kind I had ever seen, and rivals in beauty the scenery of Lucerne, though on a much smaller scale. At a neat small inn, scrupulously clean, in St Ghilgen, we stopped to rest the horses and dine; our repast consisted principally of a delicate species of trout, with a pale blue skin, the product of the adjoining lake. After dinner we continued our route, which lay along the south margin of this pretty expanse of water, and on quitting its eastern extremity, entered a defile, rugged, woody, and several miles in length. Occasionally, at ascents, I got out of the vehicle to chat with our driver, a good-humoured German, and to catch glimpses of striking points in the scene. The most remarkable thing on all sides was the density of the dark fir woods, which grew from the edge of the road to almost the tops of the mountains. So prolific was this species of timber, that miniature trees appeared to be spontaneously starting into existence on every inch of open ground—the land seemed to be groaning under wood—a mine of railway sleepers for the universe! Vast quantities of the timber were cut, barked, and thrown into the river which flowed through the defile, there to find its way to its place of destination. All this wood, and also the territory hereabouts, are the personal property of the Emperor of Austria, who derives

a large revenue from the produce and rents. The district is locally called the *Salzkammergut*, or chamber property of the salt mines—salt being its most valuable product.

Early in the evening we made our entry into Ischl, the principal, or at least the most fashionable, town in this dependency of the empire, situated in a hollow, surrounded by lofty mountains, on whose rugged sides strata of vapour reposed like masses of white wool, at different altitudes. Ischl seems to be an excellent central spot whence to radiate in short tours over this charming district. During summer, it forms a favourite resort for health-seekers, there being here hot and cold baths of natural brine, with all the accessories of recreation found at most watering-places. At the time of our visit the season had not commenced—the saloons were empty, and billiard balls were reposing since last year's fatigues. The only things which showed life were the salt manufactories—elegant buildings, not at all resembling our odious smoky salt-pans—from whose half-open roofs steam rose in clouds high above the town. There being nothing to detain us in Ischl, we went forward next morning to Ebensee, which is only a few miles distant, at the mouth of the river Traun, where it falls into the lake of Gmunden. Scenery still beautiful, and piles of cut timber increasing so enormously, that we begin to wonder what is to be done with it—no want of fuel for the salt-works of Ebensee, to which brine for evaporation is conducted in wooden pipes from Ischl.

When we arrived at Ebensee, a poor little vapoury village, we had, in the meanwhile, got to the end of land travel. Hills crowded in right and left, leaving not an inch for road, and before us lay a lake, frowned upon by stony mountains, the very riddlings of creation. The lake has for some years been navigated by a small steamer, and in ten minutes after our arrival, this vessel came in sight from behind a projecting promontory; in ten minutes more we were on its deck and under weigh. It was a pretty toy of a thing, smart in its movements, and seemed to be under capital management. I should say that I made up my mind as to these points of the boat's character before knowing anything of its commander, who turned out to be a Scotchman, and, what was better, an affable traveller; for during the whole voyage, he entertained us with observations on the country and its inhabitants, whom he described as a people industrious, orderly, and well-to-do in their small holdings. Now and then the conversation diverged to the scenery of the lake, which was always getting the prettier and more interesting. On our left or northern side, the hills are less high than on the right, and better clothed with vegetation. Villages are stuck about in picturesque spots, and green knolls bask under the shade of cherry-trees. On the right, half way down this charming lake, the Traunberg, a huge bare mountain, rises sheer from the water's edge, and lifts its scarp head high above the tumultuous sea of hills. Here we have a fine view of the town of Gmunden, whose white houses are reflected in the clear waters. We landed at Gmunden, after a sail of little more than an hour, during which we had come nearly ten miles.

Disembark—dine in a bustling restaurant—and in an hour are seated in a railway carriage for Linz, on the Danube—distance twenty to thirty miles. The reader will of course imagine that we reached Linz in at most an hour and a half. All a mistake. This was one of those innocent railways on which horse-power performs the part of a locomotive, and where, from the rate of progression, there is not the least chance of being dashed in pieces. The truth of the matter is, it is a tramway for bringing the salt from a depot at the foot of the lake; and at offings on our journey we passed hundreds of wagons loaded with that valuable material. The trip through woods, across hedgeless fields and sandy plains, occupied seven mortal hours! At dusk, after a scramble with douaniers and passport examiners—a sorry conclusion of a long day's journey—we were allowed to enter Linz, and grope our way to a hotel. Pleasant

sight—beautiful apartment—tea urn hissing on the table—and glad to have reached the capital of Upper Austria in time for the *fête Dieu*, which is to take place to-morrow.

W. C.

THE FOUNDLING.

How often have I longed for the uplifting of that veil which shrouds my birth in darkness! How many a midnight hour have I passed in intense yearnings for one moment's glimpse of those first brief hours of my existence when I still lay folded in a mother's arms, and felt her soft embrace! The indulgence of such feverish thoughts was wont to be followed by dreams of mingled agony and joy, from which I awoke only to experience more fully the loneliness of my degraded position.

My earliest recollections are connected with a cottage in the county Wicklow, where I formed part of a numerous family of children, under the care of a woman whom we all addressed by the endearing name of mother. Nurse Conolly (so she was called by the neighbours) belonged to a class which is not uncommon among Protestants in the eastern parts of Ireland; removed from the poverty of the cottier, and yet not wealthy enough to rank among farmers.

On her husband's death, she was left in possession of a few acres of land, which, under her prudent care, became a source of comfort to her family. Her dwelling was not of that squalid kind too often found by the wayside in Ireland. It contained four rooms, the largest of which served the united purpose of kitchen and sitting-room for the whole household. Adjoining this apartment was a smaller one, appropriated to the use of her son and two or three boys, who formed part of her charge; and the low garrets situated over these were occupied by Nurse Conolly and her daughter, with a little band of destitute children, who were committed to her care, having been sent out by charitable institutions in Dublin, that they might enjoy the advantages of fresh air and a good homely education. And truly Nurse Conolly was worthy of the trust reposed in her; for she was a conscientious, kind-hearted woman, who watched as sedulously over our health and wellbeing as if we were her own home-born children. Under her care we were trained to habits of order, cleanliness, and industry; and while our fare and clothing were of the cheapest kind, there was nothing slovenly or rude in their arrangements. We rose with the early dawn, and after sharing in her household labours, and partaking of brown bread and milk for our breakfast, we hastened to the parish school, bearing with us our dinner, as we did not return home until four or five o'clock in the afternoon. The intermediate hours were divided between 'books, and work, and healthful play,' so that our spirits were still fresh and gay, as we scampered homeward over fields and hedges; nor lingered on our way, unless when tempted by the wild rose or the butterfly to a chase or a scramble. If the delay had been a long one, Nurse Conolly would surely be found at the garden wicket straining her eyes in the direction of the school; and ever and anon glancing at the flowers, which were her pride as well as her pleasure; for (as she was sometimes heard to boast) the *quality* often stopped to admire her whitewashed cottage, with its trailing roses and honeysuckles.

At such times a gentle reproof awaited us. 'Sure, childer, I thought you were gone astray entirely; and the praties are boiled to rags by this time. I ought to be after chastising ye for your misbehaviour.' But a word of explanation sufficed to pacify the good dame, and we failed not to do justice to the potatoes, over-done as they might be, after they had been thrown out on a deal table, so white and clean, that the daintiest lady

in the land need not have turned away from our evening repast. As soon as the household work was done, we plied our needles and learned our tasks for the morrow; nor was the evening far advanced when, the family Bible being opened, a chapter was read aloud, verse by verse, each one bearing a part in its perusal. This was followed by a short and simple prayer, after which we retired to rest.

Such was the tenor of our peaceful and yet busy life, whose course, unmarked save by the petty troubles incident to humanity, and often enlivened by those cheap pleasures which the country affords, was full of healthful enjoyment both to our minds and bodies. I have a faint remembrance of my early childhood as having been a time of unalloyed happiness. Even now I can recall the little poultry-yard whither my kind nurse allowed me to accompany her, with oats in my apron for her family of chickens; and the small spot of waste ground wherein we used to stick twigs of Mayflower and sweetbrier, calling it our garden—an indulgence given to the younger children occasionally, 'by way of keeping them out of harm's way.' At that time my little world of thought was an unclouded one, but too soon 'a change came o'er the spirit of my dream.'

How well do I remember the first perplexing idea which occurred to disturb my mind, and to imbitter my whole being! I had nearly completed my fourth year, when one of our orphan group was attacked by pulmonary disease; and the village doctor having advised a temporary removal to her native air, her widowed mother was sent for; and on her arrival, the child flew into her arms, weeping with joy, while the poor woman lavished on her daughter such fond expressions of anxiety and love, that we all stood gazing at her, with silent emotion. On their departure, my heart felt heavy, as it had never been before, and the depression of my spirits was soon noticed by Nurse Conolly, who, in her kind, brusque way, inquired, 'Arrah, then, child! what ails ye, that ye lave the victuals untouched? Is it sick, sore, or sorry that ye be?'

'Oh, mother,' I replied, 'have I got a mammy like Kate Terry, who is gone away to-day? Tell me where is my mammy?' said I, while the tears trickled down my cheeks.

'Don't be after talking such nonsense,' was her answer. 'Sure haven't ye got me for a mammy, and isn't that enough for ye? Ain't I as good as any mammy Kate Terry has got?'

'Yes, you are very good to me, but I want a mammy of my own. Where is she?'

'Go along, child, and ask no more such questions, for I wont answer one of them,' said nurse, looking more stern than ever I had seen her before; so that I dared say no more, but crept to bed, where I soon sobbed myself to sleep.

This was a new era in my life. The existence of sorrow had scarcely been known to me before. Now I began to feel its withering influence on my own being. The thought of 'my own mammy' would often disturb and perplex me; but the crowning misery was yet to come. About two years afterwards, as a young lady was one day visiting our cottage, she patted my head, and looking at me very kindly, inquired of our nurse, 'Who is this nice little girl, Nurse Conolly?'

'She is called Mary Hammond, please your ladyship.'

'She looks delicate. Is anything the matter with her?'

'Oh, ma'am, that sort of childer are a sickly race entirely; but there's not a ha'porth the matter with her; and in troth she is not like the most of them, for she is a mighty genteel child, and very tender-hearted like.'

'Poor child!' rejoined the lady with a look of pity; and asked, 'Have you many more foundlings under your care, nurse?'

'Only two; and thankful enough I am not to have more of them, for I have had a power of trouble with

some of them before now. Come here, Sally Loman and Nanny Creed—come, show yourselves to the lady,' continued nurse, addressing herself to the only two girls of our family for whom I felt a secret dislike—not that they had ever been unkind to me; but little children, without being able to define their feelings, usually shrink from coarse, low-minded people; and such were the two girls now called over by Nurse Conolly. They were often in disgrace at school for their idleness and stupidity, and at home they were disliked on account of their sulkiness and their untidy ways. And these were my fellows! belonging to the same proscribed race! differing from their companions in some way which was an enigma to me, but which, from its very mystery, was all the more fearful to my childish imagination. This new glimpse of my degraded position brought with it a weight of misery I had never felt before. I lay awake the following night, recalling all that had passed between my nurse and her visitor; and strange as it may seem, even the praise that had been bestowed on me was gall and wormwood to my soul, for I felt humiliated at belonging to a class from which it was esteemed an honour to differ.

Few people are aware of the depth of thought and wretchedness that may dwell within the heart of a young child, unknown to those who occupy the same house, and sit around the same hearth. Happy for such a one if there be at hand some tender but experienced friend, who may gently probe the wound, and pour balm into its hidden recesses! There was no living being to whom I could look for information or comfort. The remembrance of nurse's stern manner on a former occasion withheld me from applying to her; and I shrank from making inquiries of my companions, through a fear of their scorn or raillery. So I resolved to conceal all my bitter thoughts within myself, and this self-concentration elicited the latent pride of my character; so that, from being the playful favourite of the household, I gradually became shy, sensitive, and proud. It was not long before Nurse Conolly observed the change, and expressed her anxiety lest 'something amiss should have come over me;' but her kind words, which formerly had been so grateful to me, were now unwelcome, as they seemed to me only pity in disguise; even as the pure fresh air, which is life to the healthy man, becomes poison to any part of his body which may have grown sensitive from the infliction of a wound.

Time wore on; and in spite of the one dark shadow which was cast around my path, life had many a blithe and joyous hour for me; for there is a happy buoyancy in youth which bears it up, even when passing through the deepest and most troubled waters, so that it sinks not, but rather gathers strength from each trial to rise more elastically above the next: even like those tiny skiffs which we may often have watched with fear, as they descended into the deep furrows of the ocean, and then anon we beheld them riding triumphantly over the giant-crested wave, as if exulting in their conquest over difficulty and danger. Many such hours of triumph were mine, when I found myself the acknowledged superior of those around me in every work of skill and in every intellectual acquirement.

At our yearly school examination I often detected the teacher's eye turn unconsciously to me when any difficult question required an answer; and at the annual feast that followed I was frequently noticed by the visitors, whose ill-timed praise not only increased my pride, but made me the object of envy to my companions. On our return from one of these school festivals, I was displaying my prizes to our nurse, with a spirit perhaps over-elated by success, when her son and daughter entered the room. Henry Conolly was then a youth of eighteen, his mother's pride and darling; Norah was about my own age. She was a good-humoured, kind-hearted girl of fifteen, whose chief failing was an impetuosity of temper, which occasionally impelled her to utter words which she would afterwards vainly long to recall. At this moment she was annoyed at her failure in the

morning's examination, and the sight of my prizes by no means tended to soothe her temper. Her mother unfortunately inquired where were her prizes.

'My prizes indeed! Sorra a prize I have to show. Some people are mighty clever in ingratiating themselves with the quality; but after all, it may be that they pity the poor creature who was thrown on the wide world without a skreed to her back or a friend to look after her. They who are born of honest parents don't want these things,' said she scornfully, while taking up a neat chintz frock which lay upon her mother's lap.

My heart was swelling with rage and pride as she uttered these taunting words, and I knew not what bitter retort I might have been tempted to make, but that Henry, laying his hand on her arm, said in an earnest tone—'Are you not ashamed of yourself, Norah, for speaking such cruel words to her, just because she is cleverer and prettier than yourself? If God gave you honest parents, it is no merit of yours, remember: and no matter how Mary came into the world, she is the jewel of the parish, so she is; and I won't let any one insult her as long as my name is Henry Conolly. Don't take on so, dearest Mary,' added he, on seeing the tears roll down my cheeks: 'everybody loves you: even Norah does, though her tongue is somewhat over-hasty now and then. Are you not sorry, dear Norah,' said he soothingly to his sister—'are you not sorry to vex poor Mary? Come, both of you kiss one another, and forget all that is past.' Saying this, he drew us both together, and Norah muttering some excuse, we embraced, and were at peace.

Although Nurse Conolly was by no means pleased at her daughter being 'set down,' as she called it, on my account, yet she could not be angry with her favourite Henry; and therefore contented herself by saying that he was 'a trifle too hard on his own sister,' adding, however, with a smile, that 'the minister himself could not have spoken more finely' than he did. Henry looked grave, and taking up his book, sat down in the corner of the window, where he was wont to pursue his studies. If Nurse Conolly indulged a mother's pride in her only son, others there were in the parish who thought no less favourably of him than she did. About two years before the time now alluded to, his education being completed at the minister's school, his master, a man of worth and ability, offered to instruct him in Greek and Latin if he would assist him for two or three hours daily in teaching the younger boys. This offer was joyfully accepted by Henry, who henceforth devoted every leisure moment to his new studies; and through the kind aid and counsel of our pastor, it had recently been settled that Henry should enter Trinity College as a sizer, preparatory to his undertaking the office of missionary in Canada, to which he was prompted by an earnest desire to do good, as well as by a thirst after seeing strange lands.

It was a proud, and yet sad day for his mother, when she saw him dressed in his new black coat, and setting out with the weekly carrier to Dublin. It seemed to her, she said, as though her right hand were cut off, and the joy of her heart taken from her. Her tears flowed abundantly, and all my proud ungrateful thoughts vanished as I beheld her sorrow, and knew how truly it was my own. But she needed not to conceal her sorrow; whereas I trembled lest it should be suspected that I felt his loss more acutely than the other girls of the household, knowing that the finger of scorn would be lifted against the outcast foundling, who should presume to identify her joys and sorrows with those of an 'honest-born' youth.

It was about this time that the curate of our parish having recently married, his lady undertook the instruction of some girls in psalmody; and I, among others, was desired to attend weekly at her house to receive lessons in singing. There was a calm, gentle penetration in this lady's look which attracted, and yet awed me. On the ensuing Sunday, when I entered the school-room, where we were wont to assemble for an

hour in the morning, it gave me pleasure to see her seated as teacher of the head-class, to which I belonged. Her eye rested so kindly on us all, as if it were her office not only to instruct, but to comfort us, that our young hearts could not but expand under the influence of her sunny mind. Nor was her intercourse with us confined to the hours of instruction; for she visited us weekly at our homes, and took many opportunities of seeing us alone at her own house, when she inquired kindly concerning our plans and prospects. Mrs Boyd soon gained an unbounded influence over me. I felt that she not only loved, but understood me. Whenever my forlorn position in life was alluded to by others, I felt my cheeks glowing with pride and shame; but when she gently touched this chord of sadness, my whole heart responded to her sympathy, and bursting into tears, I fell at her knees, and buried my face in her lap.

It would be impossible for me to detail the many deeds of kindness I received from this excellent lady: her reproofs, so gentle; her forbearance, so tender; her advice and aid, so judiciously bestowed; and, above all, the affectionate wisdom with which she guided me to Him who alone can heal the broken heart; and of whom she delighted to speak as my heavenly Father. Oh how sweet was that name of Father to one who knew no earthly parent! She also taught me that self-respect, so far from being akin to pride, was best cherished in a humble heart; and that the safest cure for a morbid sensitiveness was the diligent fulfilment of each practical duty which lay in my path. To crown all, having learned that the term of my school-girl life was nearly ended, and that my destination (in common with most 'people of my sort') was to be bound apprentice to some farmer's wife, she received me for a year as an inmate of her house, prepared me carefully for the office of a nursery governess, and finally placed me in her eldest sister's family, where I had the charge of three charming little children, who were my pupils and companions during the larger portion of each day.

My position was an enviable one, and I felt truly grateful to my benefactress for having procured me so desirable a home. It would have been a happy one, but that I felt one aching void, which no outward advantage could supply: I felt alone in the world. All those around me had some beloved friends who rejoiced in their weal, and wept when they were sad; but the painful conviction would often force itself upon me, that my life was not needful to the happiness of any fellow-being, and that my death would cause no blank in any human heart. Deeply sensible as I was of the kindness which had been lavished on me, I longed to be loved for my own sake, without any admixture of pitying regard. The image of Henry would often present itself to me as one whose affection was of the kind I yearned for; but we had not met for many a long day, and it seemed doubtful whether his watchful kindness might not have sprung from a desire to protect the friendless, and might therefore have faded away, during absence, into a cold remembrance of early regard. This thought cast a shadow over the brightest moments of my past life, and imbibed the present blessings of my lot.

Six months had elapsed since I had entered Mrs Aylmer's family, and on the approach of Easter, a few days' holiday were offered to me, which I thankfully accepted, with the desire of visiting my benefactress, and also the foster-mother of my early years. Mrs Boyd had invited me to her pleasant happy home, from whence, she said, I could visit the cottage daily.

How many mingled feelings of hope and fear, joy and sorrow, strove for the mastery within my heart, as the mail-car drove up to Rose Hill! The cordial welcome which awaited me gladdened my whole being; but no sooner had that soft searching glance rested upon me for a while, than I felt its magic influence as in days of yore; and before many hours were elapsed, the whole secret of my burdened soul was known to my best earthly friend. She did not chide, or wonder at my

feelings; but only observed that the most innocent affections, if allowed too unbounded a sway, often grew to be very hard masters, and that I was therefore on slippery ground: 'but,' added she, 'we will talk over all this another time, for Mr Boyd will be here immediately, and we are expecting a guest at dinner who will surely not be unwelcome to you—a young man in whom my husband is much interested, having just obtained for him the pastorship of a parish in one of the newly-settled districts in Canada.' As she spoke, my heart beat violently, and my emotion was so great, that she perceived I had guessed her meaning. 'It is your old friend Henry Conolly,' continued she; 'and he seems so humble, and yet so earnest in his desire to do good, that I trust he will prove a blessing in the country which he has adopted as his home.'

At this moment the door opened, and Mr Boyd entered with Henry. I strove to be calm, and uttered some words of welcome as he pressed my hand almost silently within his own. It was evident that he expected to see me there, and that my presence was not indifferent to him. During the evening, few words passed between us, except inquiries concerning people in whom we were mutually interested; but I felt that his eyes were upon me, and this conviction made me confused and awkward in my demeanour. As he rose to depart, I mentioned my intention of visiting his mother on the morrow. 'May I have the pleasure of escorting you to the cottage?' inquired he in a grave tone. I gave an affirmative, which seemed to me cold and formal, but I dared scarcely trust myself to speak. That night was a sleepless one; and on seeing my pale haggard countenance the following morning, I felt an uneasy sensation of disappointment, which might be deemed akin to restless vanity, but was altogether alien from it.

Nurse Conolly's cottage was about a mile distant from Mrs Boyd's dwelling. Henry called for me at the appointed hour. The beginning of our walk was silent and constrained; but soon we came in sight of the cottage, as it lay nestling beneath the hill-side, shaded by the hawthorn hedge, which separated it from the road, and sloping down in front towards the broad vale, across which we were then wending our way.

'Those were happy days,' observed Henry, 'when we all dwelt together in that cottage. Were they not, Mary?'

'Yes,' I replied hesitatingly: 'I had many happy days there.'

'And many unhappy ones too, I fear, dear Mary.'

'Was it for such as me always to feel happy?' I replied, scarcely knowing what to answer.

'Ah, if it depended upon me, there is no breath from heaven but should waft you joy and peace! no living tongue but should utter blessings on your head! no day of your life but should overflow with happiness! Perhaps I am not worthy of you, dearest Mary,' continued he; 'but even if you cast me off, never, never can I love any one as I love you.'

'Do you know what you are saying, dear Henry? Or are you mocking the misery of a—foundling? Not worthy of me! Ah, no! my fate is to live lonely and unloved; for I will never bring disgrace upon an "honest" family.'

While these words passed between us, we approached a rivulet, whose soft bright current flowed on in sparkling beauty towards the ocean. Henry stopped, and pointing to the brook, said in an agitated tone, 'Mary, can you tell from whence that bright stream has taken its rise, and yet it imparts grace and fertility to our humble vale? Even so your birth may be involved in mystery, but you are nevertheless the fairest and most precious gift which Heaven has given us here. Only tell me that I may hope to call you my own for life, and then there will no longer be a single cloud overhanging my days and darkening my prospect as it does now. Only say one word, dearest Mary,' added he in an earnest and impassioned tone.

'Your mother, Henry, what will she say to your wishes?'

'She will welcome you as you deserve to be welcomed—as an honour and a blessing to our family.'

Few words more were spoken; but they were such as can be uttered but once in a whole life, for there is no second spring-time to the heart. As we drew near the cottage, we found Nurse Conolly watching at the wicket door, even as she used to do in my childish days; and on our approach, she hastened to throw her arms around my neck, invoking a thousand blessings on my head. Then retreating a moment, and gazing earnestly upon me, she exclaimed, 'Sure, then, ye are grown such a beautiful young lady that I would scarcely have known ye; and yet ye are come to see the old woman in her cabin!'

'And who else should I like better to see than my dear nurse—my mother?' I added, being unwilling not to call her by her old name, and yet conscious that it had now a new meaning. Henry, taking his mother's hand, placed mine within it, saying, 'You will now be her mother indeed, for she has consented to be my own dear Mary.'

I will not attempt to describe the confused joy of that happy day; nor how affectionately Norah greeted her future sister; nor how we wandered over our old haunts, recalling many a childish token of sympathy or love which had soothed me in hours of grief and vexation.

I found Nurse Conolly's establishment of orphans reduced in number, as she wished Henry to have a room appropriated exclusively to his own use, whenever he had leisure to pass a few days at the cottage; and I never felt how dear Norah might be to me, until I saw the care with which she had adorned his little apartment, that he might not 'find it so strange when he came out from the fine city' to see them.

Towards evening we returned to Mrs Boyd's, lingering many a moment on our way to gaze at each familiar scene of beauty. All nature seemed to be bathed in light. Even the gray Sugar-Loaf mountains, with their dark stern peaks, looked glowing in our eyes.

But I must not linger on this part of my history. It need scarcely be said that Mr and Mrs Boyd cordially approved of our union. They, however, earnestly recommended Henry to go out first alone to Canada; and having made acquaintance with his parish, and prepared our future habitation, to return and claim me for his bride. Henry, though unwilling to oppose their wishes, warmly combated this plan, and I trembled at the thought of being separated from him; but their reasons were so convincing, and their desire so imperative with us, that it was finally decided that he should sail by the earliest packet for Canada, from whence we might look for his return in the course of eight or ten months; and that meanwhile I should resume my duties in Mrs Aylmer's family. Before another week had elapsed, he was ploughing the wide Atlantic, and I was seated among my little pupils in Fitzwilliam Square, more desirous than ever worthily to fulfil the duties that were assigned to me.

Before parting from my benefactress, she reminded me that this was the time to test the strength and sincerity of my principles, by an earnest devotion of my thoughts and talents to the round of occupations at present allotted to me, rather than suffer my mind to exhaust itself in anticipations of future happiness.

'Remember, my dear young friend,' were her parting words, 'that to-day alone is ours; and that each accession of moral strength you may now acquire will fit you more thoroughly for the arduous although happy path that lies before you.'

I carefully treasured up her words, although little dreaming of the early trial that awaited me in my new circumstances of life.

I had never before found my task as a teacher so pleasant a one; for it no longer required any effort to enter into all the little domestic joys of those around me.

No painful thought of my own utter loneliness would now check my sympathy with the daily cares and blessings of a family circle; and the resolute determination with which I concentrated all my mental faculties on the present scene during my working hours, made my leisure moments all the more sweet and welcome. Each mail brought me letters from Henry, giving details of all that interested him in his new position, and filled with yearnings for the time when my presence would change the wilderness into a fond and happy home.

The period of his return approached, and already had he named to me the ship which was to convey him to Dublin, as well as the day on which he expected to sail. Each morning I observed anxiously from what quarter the breeze was blowing; and at the end of ten days or a fortnight, began to form a restless expectation of his appearance. Each tap at the school-room door caused an agitation of feeling, which it required a strong effort to overcome, and I found it hard occasionally to repress a tendency to irritation at the mistakes and faults of those around me. Five weeks had elapsed since the time fixed for Henry's departure, and quiet hope was giving way to fear and despondency, when one afternoon, at the hour which my pupils usually spent with their mother, little Alice, the youngest, and the darling of the house, ran into the room clapping her hands, and saying, 'There is Aunt Boyd below stairs, and she is asking for you. She will come up to see you immediately; and I knew you would be so glad! so I came to tell you.'

The words were scarcely spoken when my honoured friend entered the room; and no sooner had I beheld her countenance, than its grave expression filled me with sorrowful forebodings. 'Oh, Mrs Boyd,' I exclaimed, 'what has happened to him? Tell me, I beseech you—you cannot deceive me.' She took my hand affectionately, and seating me beside herself, assured me that my fears were exaggerating the truth, and that she had only come to share my anxieties, as well as to make me acquainted with real facts, knowing how often they were distorted by report.

I interrupted her with passionate intreaties that she would let me know the worst at once.

'There is a report of the Dolphin having been seen in distress on the western coast, but the result is not known. The weather was too boisterous to admit of aid being given her. Now you know all!'

The blow was overwhelming. I fainted away. On my restoration from insensibility, I found Mrs Boyd sitting by my bedside. Her hands were gently clasped together, and from the calm, elevated expression of her countenance, I knew she was commending me to Him who is never heedless of the afflicted. Her presence recalled at once the full extent of my misery. I closed my eyes in despair. Let me not be judged too harshly by those who, when one treasure is withdrawn from them, are still attached to life by a thousand links of affection. Mine was a *foundling's* woe, and no other but one, who, like myself, has been cast homeless and nameless at pity's door, can fully sympathise with my desolation at that moment. But prayer and reflection came to my aid, and before many hours were past, I was able gratefully to acknowledge my benefactress' silent but compassionate tenderness. She proposed my accompanying her home for a while.

'No, dearest madam,' I replied; 'you have taught me the blessing of diligence in our appointed tasks, and I wish to act upon your advice. To-morrow I hope to resume my duties with those dear children.'

'You know not what you undertake. It will be impossible for you to collect your mind at a moment of such intense anxiety.' I burst into tears, and consented that Mrs Boyd should make an arrangement for my absence during a few days.

'I will stay here until to-morrow,' she said, 'and shall be at hand if you wish to see me; meanwhile I will take charge of the children, so you shall not be disturbed.'

I could only press her hand to my lips with silent thankfulness, and then was left alone.

The struggle of that afternoon was a fearful one; yet it wrought out its work of hope and trustfulness during many a future day of trial.

Towards the close of the evening Mrs Boyd once more visited my room.

'Well, dear Mary, it is all settled: you are to return with me to-morrow,' were the first words she addressed to me. There was a tremulousness in her voice which startled me.

'For Heaven's sake, what new misfortune has happened, dear madam!' I inquired hastily.

'You forget, dear Mary, that it is our business rather to hope than to fear; and indeed I cannot bear to see you look so wretched, when there is far more ground for hopefulness than for despair.'

'Do you really think so?'

'Yes, I repeat it; there is every ground for hope. Only try to be calm, and let me see that you can bear joy more courageously than grief.'

'Joy! Can there ever again be joy for me?' I asked in a desponding tone.

'Yes, joy,' she replied gently; 'if so it please Him who is the dispenser of happiness.'

The handle of the door turned, and in a moment Henry, my own beloved Henry, folded me in his arms. Words could ill describe the weight of joy which overwhelmed my spirit, and made me speechless. Yes, joy is wont to be spoken of as a light elastic feeling, which bears up the soul on its bright and buoyant wings; but this is the common daily joy of life—not that intense and concentrated emotion beneath whose pressure the whole being seems ready to sink and dissolve, as if unable to bear it.

I soon learned the history of Henry's escape, as well as the extent of my kind friend's consideration in concealing from me the earlier and more fatal reports that had reached her ears. But now all was over, and I was blessed beyond my fondest hope.

A few weeks later, we were united in the parish church, from whence the earliest prayers of our childhood had ascended. Mr Boyd pronounced the marriage blessing, and his excellent lady insisted on our all meeting around her table for the repast that followed. About a week afterwards, we parted from the home and the friends of our youth, and sailed for Quebec, bearing with us many blessings, and a store of useful gifts suited for our future residence.

It was a calm bright day on which we sailed across the Bay of Dublin; and our course was so slow, that we had leisure to trace out every well-known spot on that most lovely coast. My eye rested a moment on the great city itself, and the momentous question once more flashed across my mind, 'Have I a mother within its confines? and if so, where and who is she?' But remembering the train of miserable thoughts always flowing from this speculation, I quickly turned to gaze on the range of Wicklow hills and the peaceful vale which lay beneath them. Henry pressed my hand, saying, 'You have left kind friends behind you, my own dear Mary; but I hope to make your home beyond the seas so happy a one, that you will not regret having left all for your husband's sake.' My heart was too full to answer: but he understood my silence.

Five years have passed away since we left our native land—five years of happiness, undisturbed save by those trials which occasionally chequer the brightest existence. My husband is the beloved and honoured pastor of a wide district, throughout every part of which his presence is hailed as an omen of peace and blessing. From the windows of our well-built loghouse we catch a glimpse of the church which has recently been consecrated as our parochial house of prayer, and whose precincts are doubly hallowed to us, as being the resting-place of our first-born treasure; lent to us for a little while, and then garnered safe above—'not lost, but gone before.'

Two other lovely babes have since been given me; one of whom, my little Henry, runs already prattling by his father's side. The other, Norah, is still an infant; and as often as I fold her in my arms, I cannot refrain from thanking Heaven that my daughter enjoys a mother's care—that she is not a Foundling.

POPULAR ARCHITECTURE.

THAT architecture has become popular as a taste there can be no doubt, but it is far otherwise as an art. Vast piles of buildings are heaped up every day around us, and receive their name from the turn of an arch or the capital of a column; but we neither know nor care what are the true distinctive characters of the styles. This edifice is Gothic, because its windows are pointed; that Grecian, because it has a Doric portico. We even distinguish between Greek and Roman, and are able to tell at a glance to which the Ionic capital belongs—by the direction of the ears. All this is the learning of a schoolboy, who thinks that his '*propria quæ maribus*' conjurations are sufficient to evoke the spirit of Latin poetry.

We have only to look round us for a moment, to be sensible of the advantage that would be derived from the diffusion of popular information on this subject. Time was when honest men were satisfied with lavishing their taste and money upon public buildings, and leaving their own dwellings, as the Greeks and Romans did, in quiet inornate uniformity with the rest of the street. But our houses and shops must now vie, on a small scale, with the national monuments. We must at least be able to tell, if we are asked the question, to what order of architecture they belong; and since this necessity exists, it would be well that we could tell correctly. One answer would perhaps do for us all—*none*. Only let us get the length of this avowal, and there is no fear of us. We are far from insisting either upon the antique or mediæval model, which in our case *must* be modified by climate, and the changed circumstances of social life; but so long as we fancy that we are doing the Greek and Gothic, by getting in some of their peculiarities, head and shoulders, into our mason-work, the conception of a new order, or the adaptation of an old one, is out of the question.

In a recent reprint,* there are some amusing instances given of the popular mistakes on this subject. One relates to the Doric portico of Covent Garden theatre, which, on account of its *four columns* (the façade being of a totally different kind), is said to be 'after the model of the grand temple of Minerva, situated on the Acropolis!' Another relates to the new church of St Pancras, which, we are told, is 'the finest edifice that has been built on purely Grecian principles of architecture, and with strict adherence to the Grecian model. It is designed from the Erechtheum, or Triple temple on the Acropolis of Athens; the eastern portico of which was dedicated to Erechtheus, the sixth king of Athens; the western to Minerva Polias; and the wing to Pandrosus, the granddaughter of Erechtheus. The tower or steeple is after the manner of the Tower of the Winds, also at Athens, and follows as closely as possible the classic beauty of that celebrated building; its form being octagonal, consisting of two storeys, supported by eight pillars, the whole surmounted by a cross. The vestibule of the church is a correct representation of the Temple of the Winds.' The similarity here, Mr Cleghorn tells us, and the *only* similarity, is

* Ancient and Modern Art, Historical and Critical. By George Cleghorn, Esq. Second Edition. Edinburgh: Blackwood. 1848.

the mere portico and four caryatides, borrowed from the temple of Pandrosus, and attached, without any apparent meaning, to each flank of the church.

We have referred more especially to Greek and Gothic architecture, because, in point of fact, these are the only two styles that are affected generally by the present generation. The taste for the former, however—if that can be called a taste which is unaccompanied by intelligence—is the more generally diffused of the two; and perhaps by and by the southern part of Great Britain will be the last stronghold of the Gothic, which some architectural writers contend should be called the English.

Greek architecture is supposed to have sprung from the vast and massive forms of that of Egypt, refined and softened by a more accomplished and elegant people. The characteristic of the latter is stability. It resembles one of its grand erections, the pyramid, constructed for immortality. The pyramidal idea, indeed, runs throughout the whole system; door, window, and building alike, being set down on a broad base, narrowing upwards, as if to defy at once the assaults of time and the convulsions of nature. The plan, the ornaments, the hieroglyphics, the symbols, even the stone material, all are the same from the earliest epochs: nay, the very degree of solidity appears to have been uniform, Mr Hamilton remarking that when the edifices have not been injured by human force, they are all in the same state of preservation or decay.

About eight hundred years before the Christian era, the Greeks, whose buildings were till then chiefly of wood, began to construct walls and edifices in a species of masonry, designated, from its vastness and solidity, Cyclopean. The genius of this people, however, was not long of infusing grace and elegance into these Egyptian masses, and the three Grecian columns soon distinguished three separate orders of architecture. The Doric, however, was the national order of European Greece, and would seem to be regarded by imitators of the present day as the general type of Grecian architecture. The earliest and more remarkable specimens were grand and massive, as if betokening its descent from the colossal forms of Egypt; and even the elegance and finish which these received in after-ages, caused a surprisingly slight variation in character and expression. The Ionic was the invention of the Asiatic Greeks, and is nearly coeval with the Doric. The Corinthian was introduced towards the end of the Peloponnesian war; but the only examples of this order now extant in Greece are the Tower of the Winds, and the Choragic monument of Lysicrates at Athens. 'The taste and perfect composition of the Corinthian capital,' says Mr Cleghorn, 'sufficiently demonstrate that it could not have been of Egyptian origin, but the legitimate offspring of Grecian genius and Grecian art. Whatever hints the Greeks may have borrowed from Egyptian or Phœnician architecture, as regards the three orders of their decorative features, their superior taste, science, original genius, and fertile imagination so improved and remodelled, as to make entirely their own: they breathed into them new grace and beauty, new life and vigour; in a word, they stamped them with the highest perfection of which they were susceptible.'

These three orders were complete in character and in their sequence. 'The massive and imposing grandeur of the Doric, the adorned yet simple majesty of the Ionic, the festive sumptuousness of the Corinthian,' to use Lord Aberdeen's words, comprised all that taste and judgment could require, and left invention at fault.

De Lorme and Perrault imagined a new French order, with plumes of feathers and the insignia of royalty ornamenting the capital; in Spain, heads of lions and cornucopias were substituted; in Germany, branches of leaves were so arranged as to form sixteen volutes; and in America, heads and leaves of Indian corn vindicated the nationality of the republic. In this way men sought to make the classic models their own, by vying with the worst extravagances that were perpetrated in the decline of Grecian art.

'The Romans,' says Mr Cleghorn, 'adopted and imitated the architecture of Greece, and not only employed Grecian architects, but often had the columns and decorations executed in Greece, and transported to Italy. A sensible deviation from the style of their masters is, however, evident in most of their works. Columns are calculated more for ornament than use—they adorn the wall, or at most support the pediment. In the Greek they support the edifice, and form the wall itself. Amid the splendid structures and gorgeous display of imperial magnificence, the marks of corruption are but too conspicuous when compared with Grecian models. It is only necessary to compare the Doric and Ionic of the Greeks with the Roman orders of the same name, to be struck with the decided superiority of the former, not only in the forms and execution of the parts in detail, but in the chaste grandeur and symmetrical effect as a whole.' The Romans, however, made the comparatively neglected Corinthian their own, and by combining this ornate column with the Etruscan arch and vault, originated the style which has been chiefly followed by modern nations. They likewise added two orders, which, however, are usually regarded as mere varieties—the Tuscan being the Doric stripped of its distinctive ornaments, and the Composite, a combination of the Ionic and Corinthian. As regards the Composite, its origin is obvious enough; but we venture to think that the degradation of the Doric could hardly have occurred in the same age, and through a people whose great error was extravagance in ornament. The Tuscan column resembles the bare trunk of a tree rising from the level earth, and instead of a modification of the Doric, may more reasonably be looked upon as the antique root of Roman architecture.

The mixture of the lower Latin and Greek empires, together with the rise of Christianity, gave birth to numerous innovations. The Pagan temples were not arranged for the accommodation of a numerous congregation; and the new religionists had recourse to the basilicæ, or halls of justice, resembling in some degree a barn, with the interior divided into a central nave, and two or more aisles formed by columns supporting an entablature, with a transept at one end, swelling out from the central nave into a semicircular recess. This form was found to be so convenient, that it formed the model for the Christian architects; and the Italian term *basilica*, accordingly, describes a church of the higher order.

The Byzantine style, with its Greek cross and centre dome, supported by converging arcades, followed the separation of the eastern and western empires. 'Arches rising on arches, and cupolas over cupolas,' says Mr Hope, 'we may say that all which in the temples of Athens had been straight, and angular, and square, in the churches of Constantinople became curved and rounded, concave within, and convex without; so that after the Romans had begun by depriving the architecture of the prior Greeks of its consistency, the Christian Greeks themselves obliterated every mark of the architecture of their heathen ancestors still retained by the Romans, and made the ancient Greek architecture owe its final annihilation to the same nation which gave it birth.' The Lombards came next, producing out of the Byzantine and corrupt Latin a fantastic style of their own, which, by means of their secret societies of free-masons, whose ramifications extended on all sides, they succeeded in spreading over western and northern Europe.

But this, in process of time, was swallowed up by the GOTHIC—the distinctive feature of which was the pointed, or lancet-shaped arch, only occasionally used in the other romantic, as contradistinguished from the classical styles. The Gothic is supposed by some writers to be an imitation of the overarching boughs of the woods and groves in which the earlier nations assembled for religious worship; and Mr Cleghorn supports this theory with great warmth. 'No attentive observer,' says Bishop Warburton, 'ever viewed a regular avenue of well-grown trees intermixing their branches overhead, but it presently put him in mind of the long vista through the Gothic cathedral—or ever entered one of the larger or more elegant edifices of the kind, but it presented to his imagination an avenue of trees; and *this alone is what can truly be called the Gothic style of building.* Under this idea of so extraordinary a species of architecture, all the irregular transgressions against the art, all the monstrous offences against nature, disappear; everything has its reason; everything is in order; and a harmonious whole arises from the studious application of the means and proportions to the end. Nor could the arches be otherwise than pointed, when the workmen were to imitate the curve which branches of two opposite trees make by their insertion with one another; nor could the columns be otherwise than split into distinct shafts, when they were to represent the stems of clumps of trees growing together. On the same principles they formed the spreading ramifications of the stonework of the windows, and the stained glass in the interstices, the one to represent the branches, the other the leaves of an opening grove; and both concurred to preserve that gloomy light which inspires religious reverence and dread.' Mr Cleghorn is even of opinion that the stained glass windows and oriels were constructed on purpose to imitate the harmonious and chastened gleams of sunshine passing through the branches and openings of the richly-variegated foliage.

'The Gothic and its varieties,' says this writer, 'differ essentially from the Greek, and the styles derived from it, in this, that the great lines are vertical and upright, while in the other they are horizontal. The strength and solidity of the Gothic are the result, not of the quantity or size of the stones employed, as in the Greek and Roman, but of the art of their disposition. In the Gothic, the different details of the edifice are multiplied with the lines and scale of the building; in the Grecian, they are only expanded and enlarged. In the Gothic, the shaft bears nothing—it is only ornamental—in the Greek, the columns support the entablature. In the Gothic, buttresses are essential, and stop horizontal lines; in the Greek, there are no buttresses, and the projections are stopped by horizontal lines. In the Gothic, a pediment may be of any pitch or angle; in the Greek, the angle is fixed. In the Gothic, there is no regularity of composition, no limit to openings or variety of ornament; in the Greek, regularity of composition is essential, and openings are limited by the proportions of the column. In the Gothic, vertical lines are carried to any height; in the pure Greek, spires, towers, and domes are inadmissible, and if adopted, resemble unconnected excrescences piled above each other.'

When Roman architecture was at length restored in Italy, it was incorporated with, and enriched by, the romantic styles. Sumptuary laws no longer prohibited citizens from adorning their private dwellings, and compelled them to lavish their taste upon the national monuments. Houses, accordingly, swelled into palaces; and as wealth increased, the grandeur of antiquity was lost in modern sumptuousness and elegance. Then came, as a closing epoch, the restoration of Grecian architecture; a consummation which, if aided by popular intelligence, would fill the world with beauty.

But Mr Cleghorn complains that the English are only parcel-Greek. 'Their attention seems exclusively directed to the mere orders themselves and their details, as if in that consisted the secret and excellence of Grecian architecture. The Doric is their favourite

order. Every master-mason, every plasterer, every carpenter who knows how to work a Grecian Doric column and entablature, piques himself on his knowledge of Grecian architecture, and looks with ineffable contempt on the Roman and Italian styles, and the ignorance of his predecessors. Every dwelling-house and shop-front must have its tiny, fluted, baseless, Possum Doric columns. Every public building, be it a church or meeting-house, a palace or hospital, a college or club-house, a theatre or jail, has its Grecian, Doric, or Ionic portico. Whatever may be the style or character of the building, it becomes henceforth a genuine Grecian structure.' To this may be added the authority of the Quarterly Review:—'That the porticos themselves are admired, we need no other evidence than the universal fashion, we had almost called it *mania*, for their application. In our suburban streets we have salmon and mackerel lying in stately funeral under Doric pillars, and tripe surmounted with metopes, triglyphs, and guttæ, of the most classic proportions. In some of our fashionable club-houses, after every accommodation has been provided for the members, a portico is superadded, apparently commensurate, not so much with the building itself, as with the unexpended residue of the subscription, and adorned, like the family picture of Dr Primrose, with as many columns as the artist could afford for the money: while undecorated windows are left, like Tilburina's maid, in primitive simplicity, a portico, the indispensable necessary of architectural life, is patched on to any visible wall of our pseudo-palaces.'

A pediment and portico, unless the termination of a real roof, and an integral part of the building, is a meaningless ornament, and is no indication whatever of the Grecian style; and in like manner, if the columns do not support the roof, they are nothing more than the ornaments into which they were degraded by Roman taste. But in point of fact, the term Grecian among us merely means *something not Gothic*. 'It would be of essential advantage to the progress and purity of the art, and be the means of preventing much error and misconception, were the three styles carefully distinguished from each other both in theory and practice. Our common street elevations, shop-fronts, and dwelling-houses, mimic, in mock majesty and tawdry plaster enrichment, the style and decoration of palaces; while our public buildings are meagre without simplicity, ornate without magnificence, and costly without grandeur or durability. In the Metropolis, stone is rarely used for private houses, and not always for public buildings. Everything is sacrificed for present effect—for the caprice, novelty, and excitement of the moment. We are perfectly contented with that tawdry glitter and brilliancy, that vicious and overcharged ornament, which strikes the vulgar and ignorant. We have no classical taste, no extended views, no perseverance, no ambition to hand down lasting and national monuments to future ages.'

But the invention of window glass in the sixth century rendered a purely Greek building practically obsolete. Vases and cups were manufactured of glass by the ancients; but the adaptation of the material to windows being unknown to them, their edifices were more or less exposed to the inclemency of the weather. Their few windows were placed high in the walls, and many chambers were lighted exclusively by torches. In some temples the colonnade supporting the roof was open. Windows are now a grand feature in the building, for cupola light is not always attainable or always desirable; and windows, therefore, instead of being merely 'poked out,' should exhibit some distinctive characteristic of the order. This, however, is rarely the case. The most familiar specimen, for instance, of the Doric, so far as many of our readers are concerned, is the Royal Institution on the Mound at Edinburgh; and this magnificent building, leaving out the colossal statue and questionable sphinxes on the roof, fulfils all the conditions of a Greek temple—but with glass windows superadded. The glass windows are not incongruous in themselves, being a modification of abso-

lute necessity in the present age; but, unluckily, they are mere holes in the wall, with no more reference to the Doric than to the Gothic style of architecture. But this is a solitary grievance. The prevailing fault is the abuse of the classical forms as mere nicknacks, while the prevailing folly is the Grecian name we give to the anomalous result.

The Gothic, in like manner, becomes in our hands merely ridiculous. Baby-house towers and turrets—battlements where no battle can be waged—mock machicolations—niches in the walls for dolls instead of statues—what can be in more pitiful taste? 'The Gothic,' says Mr Macculloch, 'is not fit for dwelling-houses. Its dwelling-houses were its abbeys and castles, and were on a large scale. When we attempt to reduce them to a small scale, they become mean. The turrets of the castle, which were meant to contain men, will scarcely hold a cat; the towers will hardly admit of staircases, much less of chambers; the battlements are like the ornaments of an escutcheon; and instead of the machicolations, we have a paltry pretence.' . . . 'In partial restoration of cathedrals,' adds Mr Cleghorn, 'and other Gothic ecclesiastical and castellated structures, the same ignorance and bad taste prevailed. It consisted of little more, as Mr Rickman observes, than making clustered pillars and pointed windows, all the genuine principles of the different styles being totally neglected.'

It will be deduced from the above sketch that the people of this country want information; and without information on a subject like this, taste can do nothing. Mr Cleghorn's book, which embraces the whole of the fine arts, is so far useful, and will always be acceptable to the scholar and the artist; but its character is not sufficiently popular to supply the existing desideratum: a work for the people on ancient and modern art is still wanting.

THE DISTRESSED LEXICOGRAPHER.

NAPOLÉON reigned as emperor in France. The learned and modest lexicographer Boiste had just put the finishing stroke to his dictionary. He had arrived at the point of time so happy for an author—he had just corrected the last proof-sheet, and sent it to his publisher. Sweet was his sleep with brilliant dreams of future fame! The next day the book that would give him name and wealth was to see the light. He awoke to find his bed surrounded by gendarmes.

'Gentlemen, you have certainly made some mistake; I am Monsieur Boiste, grammarian to the Emperor.'

'The very man,' answered the laconic brigadier. 'It is all right; here is the order for the arrest of Boiste, grammarian!'

The argument was conclusive; there was no appeal; go with them he must; and soon the vehicle stopped before the Fort of Vincennes.

Once arrived at the prison, poor Boiste had some hope that the obstinate silence hitherto maintained would cease. He humbly supplicated to be told the cause of his arrest, protesting his innocence and devoted allegiance. The official, through some little feeling of respect for an old man, deigned to open the order for arrest; and after reading it, coolly answered, 'To secure the public safety.'

Poor Boiste was then sent off to a room, the iron bars of its windows securing to him three months' leisure to torture his brain in the endeavour to discover how he, who had spent his whole life arranging words under their different heads, from A to Z, could have compromised the public safety. He said to himself, with all the tranquillity of an untroubled conscience, 'It cannot be for my book that I am arrested, since it has been examined three times over, corrected, and considerably diminished, by both the heads and the subordinates in the office of the imperial censorship.'

Boiste did not content himself with lamentations, he

made strong appeals by memorials addressed to all the influential persons of his acquaintance, always concluding with this most logical conclusion, 'I have done nothing; but only tell me what I have done, that I may justify myself.'

But unhappily not one of his letters was answered. At length one appeal from the unlucky prisoner fell into the hands of Fontanes, the head of the university, who knew and esteemed the poor grammarian; and fully persuaded of the innocence of a man whose whole life had been devoted to his dictionary, he hastened to mention him to the Emperor, who, happening to be in a favourable mood that day, smiled at the artless epistle, and viewing the matter in the same light with Fontanes, sent for the Duke of Otranto. Fouché was as ignorant as they were of the ground of arrest, and was quite surprised; he had probably signed the order without reading it, and he in his turn summoned the prefect. The prefect could give no explanation, and sent for his deputy, who, after two days of research, at last found the fatal document. It was taken to the Tuileries, and there it was found that it was made out upon the denunciation of the censor, who had actually charged Boiste with having spoken of Bonaparte as a spoliator. 'How?—when?—where?' This the denunciation did not mention. The censor was ordered to make his appearance; but he was about a hundred leagues off, on a tour of inspection, exercising his vigilant superintendence of the provincial press.

'Let Boiste himself be examined,' was Napoleon's next order; 'for besides that I believe him incapable of such an act, it really would not be common sense in a dictionary.'

The next day Boiste was once more permitted to see the sun, and was carried to the cabinet of the Duke of Otranto, where Fontanes was already in attendance.

'Sir,' said Fouché, 'you are accused of a libel against the august prince who reigns over this mighty empire.'

'A libel! I, my lord? Surely you cannot believe it? A libel comes from *libellus*, a little book. Ask that gentleman, sir, at the head of our university. I know too well the meaning, the force of words, to'—

'Nevertheless,' added Fontanes, showing him the information, but keeping his finger over the signature—'read this.'

Boiste cast his eye rapidly along the paper.

'Well!' cried Fouché, seeing the quiet countenance unchanged.

'Is that all?' said Boiste.

'All! and is it not quite enough? I hope, for your sake, it is a mistake.'

'Not at all; it is the truth.'

'The truth!'

'Unquestionably; it was all to do honour to our Emperor.'

'To do honour to him!'

'Yes; to show that he was as great a linguist as he is a hero.'

'Come, sir,' said Fouché impatiently; 'it is quite time to put an end to such foolery. This is no jesting matter.'

'God forbid that I should make a jest of it; I would not take such a liberty in your excellency's presence.'

'Be good enough to give some explanation then.'

'Nothing more easy;' and taking a copy of his dictionary, which lay on the table, he opened it at the word 'spoliator,' and pointed to two words in the following order:—'*Spoliator, Bonaparte.*'

The two functionaries indignantly exclaimed, 'And what could have tempted you to such an audacious libel?'

'I was but giving his majesty the credit due to him. I put his name after the word "spoliator" as the authority for the word; he, when General Bonaparte, having been the first to make use of the expression in the tribune. It is a coinage of his own, and not known in the French language till he used it.'

Fouché and Fontanes turned upon each other a bewildered look. Boiste was set at liberty; but it cost him the expense of the sheets that replaced the seditious page through the whole edition. And Boiste thought himself happy to get off so cheaply, now that he began to perceive that his tribute to the Emperor's coinage was considered so equivocal a compliment.

ECONOMICAL NATIONAL FORCE.

MR FREDERICK HILL, inspector of prisons, has published a small pamphlet, addressed to the question of national defence.* He treats the subject with that practical sense and regard for the economical and moral good of the country which presided over the post-office reform of his distinguished brother. While regarding the late outcry about national defence as uncalled for, and perhaps dangerous, we may go so far as to admit that, in the event of any need for additional force being experienced, Mr Hill's plan will be entitled to respectful consideration. More than this, a force such as he proposes might be substituted with advantage for a certain amount of the present standing army.

Mr Hill remarks very justly, that 'many circumstances tend to keep an army in a comparatively low moral condition, and thereby to act injuriously upon public morals. The early removal from parental influence—the recklessness frequently induced by the feeling that, in a moment of anger or partial intoxication, an engagement has been entered into fatal to the person's happiness, and which it is impossible to shake off—the forced association with the rude, the violent, and the vicious—the idleness of the barrack life, with its temptations to drinking and gambling, alternating with the mad excitement, great bodily fatigue, and exposure to cold, hunger, and sickness, attendant on most kinds of warfare—the thirst for plunder, excited by the opportunities for military license, and the practice of giving prize-money—the improvidence arising from the irregular gains of a soldier, and the constant feeling of the great uncertainty of his life—the habits of licentiousness caused by the difficulties in entering into the marriage state—and the little regard for character generally felt by those who are for ever moving from place to place—these, and other causes, must act with baneful effect on the moral character of the soldiers themselves, and, through them, on the people generally.'

After illustrating this position by a variety of facts, Mr Hill goes on to discommend the raising of a soldiery by conscription, as unjust to classes and individuals, and an absurdity in itself, in as far as it disregards the special qualities requisite for the vocation of a soldier. He then asks if a body could not be formed 'consisting of men prepared by nature for warlike encounter, and trained by art to military service?—ready to resist aggression of all kinds, whether of domestic or of foreign enemies, and yet with the interests and feelings of citizens and yeomen?—of men with homes, families, and friends?—of men who have something dear to them to fight for, and which would be perilled alike by the anarchy of an ignorant mob, the tyranny of a military despotism, or the successful invasion of a foreign foe?'

He thinks such a force might be raised. He suggests it should consist of 100,000 men, under the name of the National Reserved Force, 'to be formed of men chosen from volunteers for the service, and residing, under ordinary circumstances, at their own homes, in different parts of the country.' These men he would have

regularly drilled, and ready to act, when called upon, either as a police force to suppress internal tumults, or as an army to defend the country from attack. The men to receive a small annual stipend, and in addition to be paid for their time when on duty; also to have a claim to an annuity when sixty years of age, if they have spent twenty in the service. In the selection of 'the men, great regard to be had to the moral character of the applicant, and to his being strictly sober; and, other things equal, a preference to be given to those who possess some amount of property. Indeed it is so important that the members of the force should in general be owners either of a house, a piece of land, a stock of furniture, money in a bank, shares in a public company, or some other kind of property, so that they may have a strong interest in the preservation of order—that if the proposed remuneration (together with the other inducements which are likely to exist) be not found sufficient to cause persons of this class to enter the force, it would be advisable to increase it.' Parade and drill at stated times, but so as to interfere as little as possible with the ordinary avocations of the men; every member to be obliged to reside within a certain distance of his place of muster, but to be enabled to exchange from one division of the force to another when the interests of his trade or calling render it necessary. Mr Hill roughly estimates the annual expense of this force at L.900,000; and remarks that if the new force were found to justify a reduction of the army by 25,000 or 30,000 men, it would produce a saving.

'Without stopping,' says Mr Hill, 'to inquire whether men selected on the proposed plan could not, if it were thought important, be readily made to equal ordinary soldiers, even in the minutest detail—without examining this point, it must be remarked that again and again has the proud general of a well-disciplined army found himself woefully mistaken, and compelled to yield to men who, though less erect in their bearing, were animated by a high moral feeling, a strong love of country, and a determination to defend their homes and liberties. Witness the disgraceful defeat of the Austrian and Burgundian armies in the war which gave Switzerland her freedom, and in which the power of infantry was first taught to the well-trained and iron-clad warriors of Europe by a few mountain herdsmen. Witness also the defeat of the chivalry of the first two Edwards in their attack on Scotland, ending in their utter rout at the glorious battle of Bannockburn. Witness again the disgraceful defeat of our troops in the American war; and the discomfiture of the Austrian and Prussian troops in their unjustifiable attack on France in the early period of the French Revolution, and before France had exhausted herself and weakened the attachment of her people by her atrocious invasion of other states, and her fearful conscriptions. Look also at the noble struggle of Toussaint L'Ouverture and his negro associates, and the triumph of Dessalines and his army, formed out of men who had lately been groaning in slavery, over Bonaparte's disciplined troops. And we now see how the countless hordes of Russian soldiers are kept at bay, year after year, by a few brave Circassians.'

'A consideration of these and other similar deeds must, I think, convince almost every one that men with ordinary spirit and energy, who stand on their own soil, who know every yard of the country, who have the sympathy and support of the people, and who, in their homes, their property, and their liberties, have something worth fighting for, will, with a very moderate amount of training, present an irresistible front to any invading army—a front, indeed, the very idea

* Economical Defence of the Country from Internal Tumult and Foreign Aggression. Ridgway. London: 1848.

of which would prevent any but an army of madmen from setting foot upon the coast; and shows, I think, that such a force has inherent advantages which can never be wholly possessed by troops collected even in the manner in which the English army is raised; and far less by foreign mercenaries or conscripts, animated by no pure or noble motive, and in many cases serving against their will.

The objection, that soldiering should be a trade by itself, is met by the allegation that, in reality, it cannot in peace be a trade, since it is then a life of more than semi-vacuity and idleness; a state of things not merely tending to immorality, but to violent discontent, and sometimes even mutiny. 'The gain,' he adds, 'to public morality, by a decrease of drunkenness and prostitution, with their train of misery and crime, which would result from a large diminution of the number of ordinary soldiers, would be great; while the security for our liberties would be increased by the power of the army being in a great measure transferred to men of superior education and morality, linked to society by the thousand ties produced by a family, the possession of property, and the exercise of an industrious calling.'

By some, the employing of an armed force of any kind, even for defence, may be objected to; but all experience proves that peace-officers with staves are powerless in suppressing tumultuary masses armed with muskets and other dangerous weapons, as was exemplified in a striking manner on the occasion of the late riots in Glasgow. While there exist miscreants sufficiently daring to unite in forcibly defying the law, we fear that soldiering of some sort must be considered a lamentable necessity. Mr Hill's plan may be said to reduce this evil within the narrowest possible bounds. His soldiers are to be only armed and trained civilians, ready at a moment's notice to assume a military character; and we should suppose they are to have about them as little of the pomp and buffoonery of warlike array as the most sober-minded could desire.

THE MEDICINE-MAN, OR INDIAN CURE FOR CANCER.

Among all savage nations and tribes, the observance of certain superstitious forms and ceremonies are interwoven in almost every important event, whether civil, social, or political; yet in none, perhaps, are these observances more strictly kept up than in everything relating to the practice of the healing art.

Extensive means of observation, and some length of residence among various tribes of North American Indians, particularly one called the Pottowatomie nation, which, at the time I speak of, were a wandering people on the great prairie lands of the state of Illinois, now called the Wisconsin Territory, gave me ample opportunity of observing many of their superstitious orgies, as well as their medical treatment in curing many violent and severe diseases. When I say that my only object in being among these rude people of the forest was that of acquiring a thorough knowledge of the virtues of the vegetable substances used among them as medicinal agents, being myself a physician, and having, too, the sanction of the chief of the tribe to dwell with them, it may be supposed that my opportunities of observation were unusually great. How I have profited by it, many of my patients suffering under some of the most severe diseases incident to humanity might testify; but on this head I must not enlarge.

Unknown to the classification and arrangement of the great Linnæus or succeeding botanists, many plants of surpassing power in these wild regions bloom, flourish, and decay, whose virtues are confined to the knowledge of the Medicine-man (as the doctor is called) of the tribe, and who, in the wild superstition in which he has been educated, ascribes the remarkable cures he performs more to the influence of his savage orgies than

to the true cause—the healing properties of the plants that grow beneath his tread. To those, too, whose very vocation would seem in a great degree to lie in a knowledge of the powers of the vegetable world, the medical practitioners not only of Europe, but even those of the large Atlantic cities of North America, of the very land in which these plants are indigenous, they are generally as little known as they were to the distinguished philosopher above named. We shall cease, however, to be much surprised at this fact, when we consider for a moment the unvarying system of teaching adopted at medical universities. Hear certain lectures, read certain books for a given time, answer certain questions which these books will teach: you have passed your examination—you are a qualified physician.

To the medical philosopher there are few fields fraught with so rich a harvest of discovery as the investigation of the properties of many of the plants peculiar to the fertile districts of North and South America, in relieving and permanently curing many of the most severe diseases to which the human frame is incident. The ground for these investigations is already broken to some extent by the medicine-men of the different tribes, whose rude experience and modes of practice, which they are ever most willing to exhibit and describe, would be of great value in directing many apparently intricate or obscure applications, the *modus operandi* of which the light of science might afterwards illustrate and explain.

Cancerous affections in stages of extreme malignity; the long train of obscure glandular diseases of more or less severity; the multifiform denotements of severe scrofulous affections; ulcerations of chronic duration; cutaneous maladies of various and loathsome origin and extent; tumours of indolent and malignant character; rheumatism; epilepsy; spasmodic diseases; lumbago; torpid action of the bowels or liver; incipient consumption, and the various inflammatory affections of internal organs; the bite of venomous reptiles; tetanus; and a host of less grave forms of disease, I have seen subdued and cured by these humble pharmacopoliasts.

I will proceed now to relate a case. In a wigwam in which I was for a time domiciled, a fine Indian lad of eleven years of age, in gathering berries, was bitten on the back of the hand by a moccasin snake, which he had provoked; but which he at length succeeded in capturing, and bringing home in triumph. The squaw, the only person except myself present, immediately bound the arm tightly just above the elbow-joint with a strong cord; upon the wound on the hand she applied a succession of plantain leaves (the *Alisma plantago*), wetted with oil and milk; she then prepared a strong decoction of the *Lobelia inflata*, which she gave the boy to drink freely, and placed him in a warm bed. She then strewed some salt upon the ground, burnt a hank of flax in her hand, muttered a form of prayer to the Great Spirit Manitou, and then repeated at intervals to her patient copious draughts of the decoction, notwithstanding the severe vomiting it occasioned. This treatment was kept up throughout the night, the plantain leaves being repeatedly changed for fresher ones. The following day the same treatment was followed with less vigour; and in the evening, a poultice, made of the green leaves of the *Geranium maculatum*, was applied to the wound, and the patient placed in a warm water bath prepared with the balsam of the pine-tree. On taking him out, he was pronounced to be well; and so in truth he was, excepting some degree of debility occasioned by the treatment. To my own knowledge, he was in good health five years after this event. Now, in contrast with this rude yet successful treatment by savage skill, let us place that of the regular faculty of the city of New York in a similar case. Dr Wainwright of that city was bitten on the forefinger by a rattlesnake; he was aware of the danger, and in a situation to have the immediate aid of several eminent physicians; but in vain: the life of this amiable and

talented gentleman was sacrificed for want of that knowledge of the curative properties of plants growing almost at their very doors. The death of Dr Wainwright occurred last December, and the circumstances attending it were noticed in the London 'Times.' When it is borne in mind that the bite of the rattlesnake is far less dangerous than that of the moccasin, the value of the two modes of practice will stand in still stronger contrast.

I will now proceed to detail the treatment of a severe case of cancer, occupying the whole surface of the breast in an Indian female. This woman belonged to a wandering tribe of Indians, whose nomadic habits had heretofore prevented the necessary confinement and attention to diet to effect the cure. The medicine-man, whose pupil at the time I was, having appointed his day for general consultation, and being aware, as in more civilised conditions of life, of the vast importance of assuming a great degree of consequence, had not failed to throw around himself the utmost gravity and mystery of manner on the days devoted to the public reception of the sick. These days are always during the time of the full-moon; and the one previous to reception the medicine-man observes strictly as a day of abstinence, refraining from all food except bread, water, and vegetables. Receptions usually take place in the open air, under the shade of large oak-trees; but in severe weather his own wigwam is chosen. Having divested himself of his ordinary hunting or farming dress, he robes himself in an external garment made of the skins of various kinds of snakes sewed together. This dress is girted tight at the neck, and spreads loosely around him, reaching to his feet, and rattling, at every motion of his body, with more noise than some of the venomous reptiles make when alive and about to dart on their prey. The ground having been marked in a circular form with a spade, flax, pine-tree gum, and various aromatic herbs, are burnt in an iron pot, and thrown around. The medicine-man, whose face is previously painted with red and blue streaks, sits at a table, on which is placed various roots, herbs, and plants. In the centre of the table is a large basin, made of the bark of the birch-tree, containing the blood of a new-born calf that has never cropped the herbage. Among some tribes, and formerly with this, the blood of a new-born babe, slaughtered for the purpose, was used on this occasion; but from the progress of humanity consequent upon their frequent intercourse with Europeans, the blood of a calf has been substituted, and found to be equally efficacious.

On the present occasion, there was placed on the table another vessel, containing a large quantity of clayey earth, of a yellowish red colour, dug at six feet depth from the surface of the ground. This earth had been previously most carefully pulverised, and passed through a fine sieve, every particle of stone and shell, or other extraneous substance, having been thoroughly excluded. An iron pan, containing a little charcoal, made from the wood of the yellow elm-tree (*Ulmus flavus*), in a state of bright ignition, was placed upon the ground.

The patient was brought in, carried in the arms of four men, her relations, and accompanied by a multitude of neighbours and spectators, to whom these exhibitions are ever open. She was seated on a low cork stool within the circle on the ground, and facing the medicine-man. During a form of prayer or invocation commenced by the operator, and joined in by all present, beseeching the Great Spirit Manitou to give courage to the patient, skill to the doctor, and success to the cure, the eyes of the female were bandaged with cloth, and her breast uncovered. The most perfect silence now prevails; every voice is hushed; and the medicine-man proceeds to his examination of the case. He puts no question as to the origin of the disease, or what applications have been used; but after examining the state of the glands in the *axilla* (arm-pit), and those

in the neck, much as the European surgeon would, he takes from his pocket an oval instrument, made of thin iron, about the size of a large table-spoon, and shaped somewhat like a trowel, which he heats to a red heat in the lighted charcoal, and with a sudden and light touch sears the open cancer, already in a state of ulceration, observing to touch the edges, and what he pointed out to me as the roots of the cancer, but which were, in truth, the deep sinuses occasioned by the progress of irregular ulceration. At the touch of the iron, the woman shivered, and slightly shrank back, but uttered neither moan nor cry. Immediately after this, the proper plants, in a green state, previously soaked in the blood of the calf, were spread all over the cancer; the earth was then laid on the plants about the thickness of an inch or a little more, having been made into a clayish paste by mixing the blood with it. Thus much for the treatment. For the prognosis, or probable result, three small peas had for a few days previously been placed in earth and water, until they were just on the point of germinating; being carefully removed, they were pressed down into the covering of the diseased breast, and the earth gently smoothed over them by the fingers. Suitable bandages, made of cloth and the inner layers of the white birch bark, were applied; and to insure the earth keeping in its place, a pair of stays (or garment of their precise form) was tightly secured round the chest. The woman was then delivered to her friends, and placed in a recumbent position upon a species of palanquin; orders were given as to her diet, which was strictly antiphlogistic, and she was then conveyed home, with a caution to remain in the same position until the visit of the medicine-man, to take place on the third day after.

At the moment the medicine-man commenced his treatment with the application of the heated iron, and during its continuance, until her arrival at the door of her own home, the following words were chanted, in a slow mournful measure, by all who accompanied her. The translation has been furnished by a friend versed in the language of the tribe:—

'Fertile earth and growing grain,
Ease this woman of her pain;
Fire to purge thy pains away,
Earth to cleanse and purify;
Sow the seeds in hope to grow,
By thy blessing, Manitou.
Sow the seeds, &c.

The prognosis by the peas is much relied on. In truth, divination is peculiar to all savage tribes; and though frequently deceived, they still adhere with strong tenacity to the ancient superstitious observances of their forefathers. If the three, or two out of the three peas continue the process of germination, so that the earth is slightly broken in their attempt to reach its surface, the result is predicted as highly favourable; if one only, not so favourable; still the woman will recover, but slowly; and the prognosis would be doubtful as to the recurrence of the disease in after-life. Should none of them germinate, which often happens from accidental causes—such as changing the position of the earth by the necessary movements of the body—then an unfavourable conclusion is looked for, and the patient and her friends are apprised that the Great Spirit Manitou needs her presence in the hunting-grounds of her forefathers, and bids her prepare for death.

I should have mentioned, that after the third day, the medicine-man attends the patient at her own wigwam at such times as he considers necessary, and the subsequent treatment is with the decoctions made from the plants useful in the case, together with medicines given internally. In many cases, if not in all, I am assured that the searing of the diseased surface with the heated iron has been attended with most injurious results, increasing the inflammatory disposition, destroying the vitality of the parts essential to the healing

process, and sometimes producing extensive mortification and sloughing. The earth, too, very frequently acts as an extraneous and irritating substance; and as to the value of the pea prognosis, the less we say of it the better.

HELP YOURSELVES.

UNDER this title a small pamphlet or circular was lately handed to us by a correspondent. Consisting of an address to workmen on the subject of economising means, it embraces the history of an operative who, with no remarkable advantages, and without change of position, was able to attain a state of independence. In order to bring it under general notice, we give it a place in our pages.

Englishmen have much to be thankful for, inasmuch as there is probably no country on the face of the globe where sober, industrious young mechanics and labourers can so soon raise themselves to ease, comparative independence, and comfort, as in England. Many instances in real life might be given in proof thereof; yet our present purpose may be best answered by presenting the case of one who, having lost his father and mother in childhood, has been indebted to the kind-hearted for the school learning he has acquired. During his apprenticeship he gained little beyond habits of industry. In the seven years of his apprenticeship, his master fell from a respectable station to one of abject poverty, owing to his taking the one glass, then the two, three, four, and onwards; till, by steps almost imperceptible, his business and family were neglected, whilst he joined his associates at the alehouse. But let us not dwell on this sad picture. On completing his twenty-first year, our orphan boy engaged in a situation where he received 15s. per week wages; 8s. of which he appropriated to food and lodging, and 2s. to clothing and a few useful books to rub up his schoolday learning. Warned by the example of his late master, he shunned the alehouse, and his steady conduct soon gained him the confidence of his employer, who, at the end of the first year, raised his wages to 21s. per week. At the end of the second year he found himself possessed of upwards of L.40; .5s. per week had been regularly deposited in the bank for savings during the first year, which amounted to L.13; and in the second year 11s. per week, which was L.28, 12s. more. We need not follow him, step by step, in his steady but onward course. He has now been nineteen years in his present situation; for the last ten, he has been the foreman, with a salary of 30s. per week. Twelve years ago he married a virtuous young woman, and has now six fine children. The house he lives in is his own; a good garden is attached to it, and a fruitful and lovely spot it is; it serves as an excellent training-ground for his children, whose very amusements in it are turned to good account. The mother brought no fortune with her except herself. She had, indeed, lived as servant some years in a respectable family, where she had high wages; but all she could spare was devoted to the support of an infirm mother, who, on her marriage, was received into her husband's house, where the evening of her life is rendered happy. How is it, you ask, that a man at forty years of age, who has had nothing to depend upon but his own labour—who has a wife and six children, and an infirm mother-in-law to support—can have bought a piece of ground, built a house upon it, and can have it well furnished, and, after all, has upwards of L.200 out on interest? for he has been a servant all along, and is a servant still. Well, let us see if we can find out how it is. In the first place (and which, after all, is the main point), he spends nothing at the alehouse; the money which too many worse than waste there, he saves.

At the age of twenty-three, we found he had in the bank of savings L.40.

At the age of 24 he has	-	-	-	L.70
At ... 25 ...	-	-	-	109
At ... 26 ...	-	-	-	135
At ... 27 ...	-	-	-	170
At ... 28 ...	-	-	-	206

He now marries, and expends on furniture L.40, reducing the amount at interest to L.166; but his wages are now advanced to 25s., and his expenditure is increased to 20s. per week; his saving of 5s. per week and interest in the year, amount to L.21, added to L.166, makes L.187, when twenty-nine years of age.

At thirty years of age he has L.210; wages now 30s. per

week; saves 10s., and interest, he has L.247 at thirty-one years of age.

At thirty-two years of age he has L.286; buys a plot of ground for L.100; expends L.150 in building his dwelling-house; so that he reduces his money at interest to L.36; saves his 10s. per week, and interest on L.36—L.27, 16s.; making L.63, 16s. at the age of thirty-three.

At 34 he has	-	-	-	-	L.93
At 35 ...	-	-	-	-	123
At 36 ...	-	-	-	-	155
At 37 ...	-	-	-	-	181
At 38 ...	-	-	-	-	207

He now expends the interest, and saves only 10s. per week.

At 39 he has	-	-	-	-	L.233
At 40 ...	-	-	-	-	259

In addition to his house and garden.

These calculations have been made in consequence of the writer having been informed that there are at the present time from 300 to 400 workmen employed by one company in Hull, many of whom are earning great wages, and spending no inconsiderable portion of them in a manner which their best friends regret. It is with a view of directing their *close* attention to the great good that they might do for themselves, by proper forethought, that these remarks are penned. There is nothing in this calculation which 80 out of every 100, who earn from 25s. to 80s. per week, might not effect, if they were wise enough to pursue the same plan. Mind that your houses be comfortable, well-furnished, supplied with useful books—above all, the Bible, and read a portion of it every day, with prayer that it may be blessed to you and yours. Contrast, for a moment, the condition of those who thus rightly employ the means placed within their power of providing comfortably for themselves and families, with those who squander in thoughtless waste, first the few shillings, then the many pounds, in procuring that which yields *no comfort*, brings *no health*, affords *no solace* for declining years; then judge for yourselves which course you will pursue.

WHAT IS EDUCATION?—ANSWERED.

THE inquiry as to what education really is—whether it be verbal teaching or practical training—has been satisfactorily answered, as follows, by Mr David Stow, honorary secretary of the Free Normal Seminary, Glasgow, in a small work recently published on the subject of National Education:—

What the education is that will best enable a man to educate himself, ought surely to be the sovereign question. Is it *instruction*, or is it *training*? Is it the amount of elementary knowledge communicated, or is it the exercise of mind required by which the pupil may educate himself? Till lately, the term used to define education was *INSTRUCTION*. Give religious instruction, it was, and is still said, and this will be sufficient. Teach the poor to read the Bible, and forthwith you will make them holy, happy, and good citizens—good parents—obedient children—kind and compassionate—honourable in their dealings—and crime will diminish. Hundreds of thousands have received such an education.—Are such the results? We trow not. Have we hit upon the right kind of education, or the proper mode of communication? Will all the instruction it is possible to give produce the results which are so fondly anticipated? Will all the *telling*, or teaching, or instruction in the world, enable a person to make a shoe, construct a machine, ride, write, or paint, without *training*—that is, without *doing*? Will the *knowledge* of religious truth make a good man without the practice of it? The boy may repeat most correctly, and even understand in a general way, the precepts, "Avenge not yourselves, but rather give place unto wrath," "Render not evil for evil," "Be courteous;" but see him at play among his companions, neither better, nor perhaps worse, than himself, unsuperintended, and his conduct unreviewed, by parent or schoolmaster, and what do these Scriptural injunctions avail him when engaged in a quarrel? Reason is dormant, passion reigns for the time, and the repeated exercise of such propensities strengthens the disposition, and eventually forms evil *habits*. The father cannot be with his child to train him, whatever his business or profession may be, during the day, and a healthy boy will not be tied to the apron-strings of his mother—out he will go, and out he gets to the streets, to be with such companions as he can pick up.

'In education, as hitherto conducted in school, even under the most highly-intellectual system, we have had instruction, and not training. Schools are not so constructed as to enable the child to be superintended—the master has not the opportunity of training, except under the *unnatural* restraint of a covered school-room; and it is imagined, or at least stated, that children are morally trained without their being placed in circumstances where their moral dispositions and habits may be developed and cultivated; as if it were possible to train a bird to fly in a cage, or a race-horse to run in a stable.

'Man is not all head—all feeling—or all animal energy. He is a compound being, and must be trained as such; and the varied powers of mind and of body, although distinct, so act and react upon each other, that it is difficult to say where the influence of the one begins and that of the other ends. The intellectual, to a certain extent, influences the physical, and *vice versa*; while the moral influences both, and is influenced by both in return. The most influential and successful mode of cultivating the child is, therefore, when his whole powers are daily and *simultaneously* exercised; and no injury can arise to his varied powers of body and mind, provided they be fed, and not stuffed—trained, and not merely instructed.

'How do we purpose morally, physically, and intellectually to elevate the mass of our population, among whom there is not, on the part of parents, either the opportunity or the intelligence to accomplish this object? If done at all, it must be almost exclusively performed by the school trainer. *It is not now done by the schoolmaster, and cannot be accomplished by the parent.* Therefore our youth are growing up untrained in a moral, and even in an intellectual point of view, although it is announced that "the school-master is abroad." In reality, we have much said, and little done. The truth is forced upon our attention, that *teaching is not training.*'

'The Sabbath school was, and still is, too weak and powerless to contend with the *sympathy of numbers*; there being, even when best conducted, only the *teaching* of one day set against the *training* of an opposite tendency during the other six days of the week. In the Sabbath school there was the teaching of the master, *without sympathy* set against the sympathy and training of the streets, and frequently even of the family. Need we wonder, then, that the one day's teaching or instruction was (and still continues to be) overborne and counteracted by the six days' *training*?'

In other words, the conviction at which Mr Stow appears to have arrived is this—that no mere teaching, no learning of lessons or catechisms, no mere putting on the memory a large variety of psalms or other exercises, is education. Besides technical instruction, *training* is indispensable. Good habits require to be enforced and confirmed by practical acts—by doing that which is right, as well as merely *knowing* what is to be done. For saying as much, educationists have for many years suffered abuse. It is gratifying to find a person in Mr Stow's position vindicating so sound a principle in education.

A PLEA FOR THE MOLES.

The 'Essex Herald' publishes the following letter from the Rev. G. Wilkins to a farmer, who wrote to him inquiring how the wireworm had been exterminated in the reverend gentleman's land. It contains much sound, though, we daresay, unpalatable doctrine to the owners of smooth lawns and trim-bedded gardens:—'Some ten years since, when I came to my living, and commenced cultivating the little land I hold, it was, I may say, full of wireworms. Nothing could have been worse, for my crops were in some places ruined by them entirely. What, then, did I do? I adopted a plan which I recommended and published in periodicals many years since—namely, encouraging moles and partridges on my lands. Instead of permitting a mole to be caught, I bought all I could, and turned them down alive; and soon my fields, one after another, were full of mole-hills, to the amusement of all my neighbours, who at first set me down for half a lunatic; but now several adopt my plan, and are strenuous advocates of it. My fields became exactly like a honeycomb; and this continued even among my standing and growing and ripening crops; not a mole was molested, but I still bought more. This summer I had fourteen brought, which I turned down; but they were not wanted: I have nothing for them to eat—all that moles live upon is destroyed—and so, poor things,

they must starve, or emigrate to some distant lands, and thus get bowstringed by savage men, whom they aim to serve. Adopt my plan, and it will be sure to answer. If you have a nest of partridges, also encourage them: all the summer they live on insects, on wireworms, &c.; and consider how many millions a covey will destroy in a single summer. Again, always remember that moles feed upon insects, and of which the wireworm is the chief; if you doubt this, open a mole, and peep into his stomach. Again, do not fear that moles injure your crops, either in a field or in a garden: it is a low and vulgar error to suppose that they root up young corn; they never go anywhere until the wireworms have first destroyed the plants, and then, innocent things, they are punished for others' faults! If you do not like to see their hills, knock them about with a hoe, as I did; it is a healthful amusement, and they will do your lands good. Do not despise my plan because the farmers will not adopt it in your neighbourhood: farmers adopt nothing till driven to it, and nothing that is new and good.'

GLASS IN DAIRIES.

The attention of dairymen has of late been pretty much called to the advantages of glass as a non-conductor of electricity, in the preservation of milk in glass pans. It was only a short time since that we were shown a glass bottle full of milk that had been preserved in India and China, and when drawn, after eighteen months' preservation, was not only found to be perfectly sweet, but to contain, in a solid and cohesive state, a small quantity of excellent butter; while the milk preserved in a tin case during the same voyage had gone to acid. It now appears that glass milk-pans produce almost equally remarkable results; and from an analysis we have seen of the cream which was thrown up on some of Harria's Compressed Register, it appears that the difference is in favour of the glass, as compared with the wooden or wedgeware pan, by at least ten per cent.—*Scottish Farmer.*

E G Y P T.

'Dinanzi a me non fur cose create,
Se non eterne, ed io eterno duro.'

DANTE.

On the deep rock of Ages have I set
My everlasting Pyramid, and look round
From its great throne on oceans without bound;
Time shoreless, shifting sands, and realms as yet
Growing to being. Of all here who met—
Persian, Greek, Roman, Arab—who hath stood?
All, all have drifted onward by my base,
And here I hold amidst their surge my place!
Before me things were not, or such as could
Endure like me, eternal. The broad Nile,
Young as the day it leaped to life, and made
Life wheresoe'er it moved—the godlike sky,
Star-written book unfathomable—the pile
Of mountain-walls around—these shall not fade.
They were—and are—and shall be!—*So shall I!*

M. R. J.

JOHN RAY.

A CORRESPONDENT obligingly forwards the following note:—'As an Essex man, I hope to be forgiven for mentioning that a slight error has been committed in a recent article in the Journal in reference to the life of John Ray. Baintree is stated to be a village in Suffolk, whereas it is one of the chief towns of the northern division of Essex, possessing an endowed grammar school, at which John Ray was educated. Black Notley is the adjoining village to Baintree, and the churchyard in which John Ray lies buried is about three miles distant from that town. The Essex folk are proud of John Ray. His tomb is within a pleasant walk of Baintree, and is occasionally visited by botanists. I have even known pilgrimages to be made thither, on which occasions ferns, mosses, and wild flowers, gathered by the way, have been duly and reverently laid upon his grave. John was evidently fond of Essex; and were he alive, I hardly think he would be pleased with the notion of transporting his remains to Suffolk.'

DOMESTIC ACCOMPLISHMENTS.

THE term accomplishments is so commonly applied to what are thought merely ornamental arts and graces, that the use of the sober word domestic in connection with it may excite some surprise. I commence my explanation with an assertion that there are two kinds of utility—the one material, and the other spiritual; the one contributing to the sustenance of the bodily existence, the other to the enrichment of our intellectual nature. Hence when we speak of objects of utility, it is narrowing the word to limit it to visible and tangible things. In one sense, that only is useful which is convertible, in some form or other, into bread; in the other, that is of the first and highest utility which, whether or not it advantage the body, serves to promote the well-being of the mind. If we turn to God's creation, we shall find provision made for both ends, and this more richly than at first sight we may be able to perceive. Let us for a moment imagine a world into which only the lower kind of utility had entered, in order that we may see how marvellously they have been blended in our own. Beginning with rain and dew, why might not the earth have been sufficiently watered by a great black cloud, which should fill the heavens periodically from zenith to horizon? Why might not the flowers have fulfilled all their chemical functions without those delicately-veined petals, and the birds performed their appointed tasks without that dainty plumage and that exquisite song? The outward form of this higher utility men have agreed to call beauty; but unhappily they have too often divorced it from the lower, with which, in nature, it is connected; and thus, on the one hand, we have utilitarians decrying all that cannot be turned into pence; on the other, idle dilettanti, who imagine the world to be a mere spectacle, and forget the saying of St Paul, that 'if a man will not work, neither shall he eat.' One of the great objects for which beauty was bestowed, was undoubtedly that it might be a means of uniting together those who are divided by motives of interest and gain. The essential principle of material utility is exclusiveness, just as that of spiritual is comprehensiveness and universality. Every vegetable I gather for my own table is one less to be given to my neighbour; whereas the greater the number of persons who can inhale the fragrance of my flower-garden, the more perfect my individual delight in the same. Now the larger part of our daily life is a prolonged attempt to obtain those substantial benefits which begin and end with ourselves; and the inevitable tendency of this is to make us selfish and hard-natured, unless some counteracting influence be set to work. Having divided men by the necessities of daily labour, we must endeavour to reunite them by innocent relaxations; and on this account amusements require the

deepest consideration, for they are connected with our social wellbeing in a variety of ways. Business and enjoyment should act and react on one another, as the centripetal and centrifugal forces do in nature: we want the one to give steadiness and stability to the life, the other to provide expansion for the feelings and ventilation for the mind. But for this latter purpose it is impossible to work much on a large scale; we must content ourselves, for the most part, with the resources the family affords; and I, for one, am persuaded, that if these were turned to better account, our social evils would be found to diminish both in number and extent.

But for a wish to leave the reader sufficient interest to pursue the subject for himself, I might have gone into the philosophy of amusements, as connected with morality, and shown how community of enjoyment serves to bind men together in heart. Turning my back, however, on the theoretical side of the subject, I proceed to consider some of its leading particulars, in the hope that an acquaintance with the simplicity of the necessary means may be a stimulus to our efforts in the cause of social reformation.

I would, in the first place, urge that whatever elegant acquirements we may chance to have made, instead of being reserved for rare occasions, should be suffered to shed their softening influence on our every-day existence. The prints should not be carefully kept out of sight of the children of the family, and turned over only for the benefit of the stranger; the pictures should not be curtained except when there is company; or the piano be dumb because there is 'no one but ourselves' to listen. There may be less triumph, but there is surely equal if not greater happiness in singing by the fireside than in warbling in the saloon; and though the thanks of father or of brother be homely in expression, there is more sweetness in them than in all the studied commonplaces of society.

A sadder sight can scarcely be conceived than that of the spirit of dulness taking possession of the family circle. We see it in the husband who, hour by hour, gazes moodily at the fire; in the wife who occupies herself with her mechanical employment, without seeking to break the enchanted silence. Neither entertains the intention of injuring the other, and yet they are mutually defrauded of the happiness they ought to enjoy. Both are conscious of an unsatisfied want, an unfulfilled desire; and this influencing their manner without their being aware of it, the consequence is, that they become mutually repellent. Now what would have prevented them from subsiding into this state at first, and what is most likely to rouse them from it? Clearly something that would not only offer bodily rest, but quiet and gentle excitement of mind; something that would remind them of the world of beauty in which we dwell, and of the thousand objects of inte-

rest by which we are surrounded. Surely in nature or art there must be something that would fix their interest, if they could succeed in finding it out. But the pleasures we desire to enjoy we must be at the pains of making for ourselves.

In the domestic relationship there ought to be no selfishness. The pleasure of one should be the happiness of all; and this surely can be attained without unduly encroaching on individuality. Wives are sometimes heard to complain that their husbands do not talk to and confide in them; they leave them to mope and become nervish. This is undoubtedly true; but the husbands as frequently allege that it is no use pouring out their feelings to their wives, because they don't sympathise with them. Perhaps the misunderstanding arises from women not sufficiently comprehending that men have spirits to be cheered—hobbies, it may be, requiring a degree of sympathy—faculties which cannot brook being subdued, without danger to the temper. Man, in short, 'cannot live on bread alone;' he needs something besides bodily comforts. A wife of course is not without excuse; but granted that she has her express household duties, and also matters of some little moment to herself to attend to, would it not be better that the new cap should go untrimmed, or perhaps be finished by less skilful hands, than that the being she has vowed to 'cherish' should come home 'seeking rest, and finding none.' The common idea with regard to rest is, that it consists of a bright fire, an easy-chair, and a comfortable pair of slippers; and under this impression, when the husband has been provided with tea and toast, he is considered to be disposed of for the remainder of the evening. That for a certain class of persons this suffices, I am ready to admit; but happily there are minds not so easily satisfied—minds for whom comfort is not synonymous with happiness, whose rest is found in change of employment rather than in idleness. Many of these read, and find interest for themselves; an interest in which, unhappily, the wife is no partaker; others seek abroad what is denied them at home, and regard their own houses as places where they can be boarded and lodged. That we are all disposed to seek the causes of our failures anywhere rather than in ourselves, is a fact which no one will be hardy enough to deny. But for this unfortunate tendency, it might have been hoped that our mistakes would teach us wisdom; and that, seeing our present habits were unfavourable to domestic happiness, we should revise them, with a view to remedying what had been wrong. My own impression of the duty of the mistress of a family is, that it is broader than it is commonly supposed to be, and extends to supplying not only the bodily, but also the spiritual wants of its members. I conceive it to be incumbent on her, as far as possible, to bestow happiness on all who belong to her circle; and this applies peculiarly to him whose very existence is bound up with her own. The care of the linen, and the control of the larder, too often stand in place of sympathy and companionship; and sad as it is to hear it imputed to men that they care principally for dinner, can it be wondered at if it is the only thing they can make sure of getting?

Every woman who has an aptitude for music or for singing, should bless God for the gift, and cultivate it with diligence; not that she may dazzle strangers, or win applause from a crowd, but that she may bring gladness to her own fireside. The influence of music in strengthening the affections is far from being

perceived by many of its admirers: a sweet melody binds all hearts together, as it were, with a golden cord; it makes the pulses beat in unison, and the hearts thrill with sympathy. But the music of the fireside must be simple and unpretending; it does not require brilliancy of execution, but tenderness of feeling—a merry tune for the young, and a more subdued strain for the aged, but none of the noisy clap-trap which is so popular in public. It is a mistake to suppose that to enjoy music requires great cultivation; the *degree* of enjoyment will of course vary with our power of appreciation, but like all other great influences, it is able to attract even the ignorant; and this is what the poets taught when they made Orpheus and his brethren the civilisers of the earth. Begin with simple airs, and you may gradually ascend to the highest music, for the taste will be formed at the same time that the mind is refreshed; and those who begin with admiring only the simple ballad of the nursery, will end with delighting in the productions of the great masters of song.

Much remains to be said with regard to music; but my desire is to indicate rather than to amplify. I will therefore proceed to mention another 'domestic accomplishment' to which I attach the highest value—the power of reading aloud agreeably and well. Unhappily this is very rare. For every three women who can sing, it would be difficult to find one who can be said to read *well*; that is, who so completely possesses herself of the meaning of a writer, as to be able to give us his thoughts in all their original freshness and force. Highly as I value music and singing, I do not know whether reading is not, on the whole, more important; for it may be made to include all tastes, and to suit all times, and combines intellectual profit with spiritual delight. The man who can sit by his own fireside to hear his favourite authors in the tones of a voice at once familiar and dear, will feel little interest in public amusements, and little temptation from any kind or species of excitement. And how the happiness that follows is intensified to both by the fact of its being enjoyed in common. It is blessed to be ministered to by those we love—more blessed than anything, save to minister.

And now let me anticipate one objection: that the foregoing remarks are addressed to certain classes, and to those only; that they apply to people who are surrounded by luxuries, and not to those who earn their daily bread in the sweat of their brow. This arises from confounding the graceful and the costly, and imagining that elegance presupposes wealth; whereas it is possible to see the highest refinement in those who are destitute of all the luxuries of life. In cases where musical instruments are not within reach, we may modulate our own voices, and make them give forth sweet sounds; we may sing those simple strains which require neither teaching nor skill, but which, if they come from one heart, are sure of finding their way to another.

On one side of the subject I have been altogether silent—not from having nothing to say, but a great deal too much: this is the importance of 'domestic accomplishments' with reference to education and the training of the young. My reader must consider this question for himself, or for *herself*, for to women my thoughts are specially addressed. Would I could convince them that their life is a beautiful and a happy one, if they will but study its meaning, and carry out its requirements! Has it not been given to us to infuse into the cup of life a large portion of its sweetness,

and to lighten the labours undertaken on our behalf? May these duties be better fulfilled as the years advance, and may our sympathy be yielded with that cordial alacrity which is its greatest charm! Above all, may none of the frivolities of fashion or of custom be suffered to obscure the brightness of our domestic happiness!

THE MYSTERIOUS LODGER.

MONSIEUR HYACINTHE was a quiet middle-aged widower of retired habits, and an exceedingly cautious and timid disposition. It was one of his firmly-rooted beliefs that the whole world was in a kind of league to oppress him, and defraud him of his rights—a feeling which prevented him from agreeing with any one, from his important and stately landlord, Monsieur Moreau, down to his sharp-tempered portress, Madame Latour.

Owing to this peculiarity, M. Hyacinthe resided alone in a small apartment on the third floor of a quiet house in a retired neighbourhood. As he kept no servant, he had economically resolved to underlet, furnished, a small servants' room on the fourth floor, which belonged to his apartment. This room was still to be let, when, on a winter's evening several years ago, M. Hyacinthe, after putting on his nightcap, and settling himself comfortably by the fireside, opened his newspaper, in order to read the continuation of some fearful tale which it contained; for, like most timid individuals, he delighted in the sad and the horrible. He had not read a line, however, when he was disturbed by a knock at the door. His first thought was of thieves; then it occurred to him that the knock, which was now repeated, might proceed from a visitor. It was not until a third impatient knock was heard that M. Hyacinthe suddenly recollected that the individual at the door might be a future lodger. No sooner had this thought impressed itself on his mind, than, snatching up a light, and entirely forgetting his nightcap, he precipitately rushed to open the door. A pale, slender, fair-haired young man, about twenty, but whose manners were very cool and self-possessed, was standing on the dark landing. He was showily dressed, and smelt very strongly of Eau de Cologne; the thumb of his left hand was placed in the corresponding waistcoat pocket; in the other hand he held a small and flexible *badine*.

'Well, sir,' said he, frowning on M. Hyacinthe, as much as his very smooth forehead and eyebrows would allow him to frown, 'do you know that I have knocked five times at your door?'

'I protest, sir,' stammered forth M. Hyacinthe, 'I only heard three knocks.'

'Then, sir,' sternly observed the stranger, 'it was exceedingly impertinent in you not to open sooner. You have a room to let—show it to me!'

But M. Hyacinthe, who disliked his authoritative tone, promptly replied that the room was no longer to be let.

On hearing this the stranger betrayed great indignation. 'Why was there a bill up? Did he think gentlemen were to grope up dark stairs, and knock at doors, to be made fools of? He should insist on seeing the room!'

M. Hyacinthe protested, but the stranger was peremptory; and as it was one of his, M. Hyacinthe's, maxims, that a wise man ought to submit to anything in order to avoid a present risk, he yielded at length, though not without calling on every one to witness that he was no longer a free agent. As the stranger was the only person who could hear this protest, it was useless; but M. Hyacinthe's conscience was satisfied—he had done everything which a brave and peaceable man could do, and he proceeded to show the furnished room to the stranger, now fully warned of his illegal conduct. The young man cast a careless look around him, observed that the room suited him, and throwing two gold pieces

on the table, bade M. Hyacinthe pay himself for the first month's rent, and keep the change until another month was up. Without giving M. Hyacinthe the time to remonstrate, he proceeded to inform him that he could apply to Madame Schillard, his present landlady, for references, but that, as he hated hypocrisy, he would give him his character himself; and in order to do this with due comfort, he composedly sat down on the bed.

'My name,' he began, 'is Henri Renaudin. Is it my real name? That is of no consequence. My father is rich: I might live in his hotel if I liked; but there is a stepmother in the way, and I wish to be free. Still you will say—Why come to a poor place like this? I have private reasons for doing so; but to satisfy you, we will say a whim brought me hither, or rather let it be the wish of studying human nature in all its infinite variety;' and as though pleased with this euphonious sentence, M. Renaudin repeated it several times in a complacent tone.

M. Hyacinthe here wanted to slip in a remark; but the other was too quick for him. 'I know what you are going to say—Does my father allow me much? No; but I make him pay the same tailor's bills two or three times over: I never pay my tailor myself; it is really too shabby,' added M. Renaudin, with profound contempt for the meanness of such an act. 'You need not speak,' he continued, seeing that M. Hyacinthe was opening his mouth; 'I know what you are going to say—How do I get money? The easiest thing in the world: I have already spent three fortunes, of which I never touched a sou. My mother's fortune was the first. Oh, no! now I think of it, it was my cousin's five hundred thousand francs that went first. Ah! they are all gone. Then came my mother's property—gone too: and my old uncle's fortune is going now. He is still alive, but he has made a will in my favour, so that I live on my future expectations. You seem astonished: it is very easy: I can put you in the way: borrow money at the rate of two or three hundred per cent., spend it, give parties, and so forth; you will find that a moderate fortune does not last much more than a year. But you look economical: well, then, let us say eighteen months, if you wish to see old Isaac.'

'Thank you, sir,' precipitately interrupted M. Hyacinthe: 'you were speaking about your character?'

'You are welcome to it. In the first place, I am a dreadful gambler and a fearful spendthrift. I delight in throwing money out of the windows, and seeing the people rush and fight for it. Does this window look out on the street? No: ah, sorry for it. Never mind, we shall find an opportunity. I see you are greatly shocked; can't help it, my dear sir—family failing—my mother was a charming woman, but very extravagant, yet greatly admired by the other sex; and to say the truth, I believe that I have also inherited this peculiarity—that is to say, reversed; but I hate vanity, so we will drop the subject. Well, I think you have my character correctly now. Stop, I was forgetting one very remarkable peculiarity: I am dreadfully violent, a famous duellist, and when excited, would no more mind throwing you out of the window than I would the smoking of a cigar; and as an apt illustration of this happy comparison, M. Renaudin drew a cigar from his cigar-case, and lighting it from the candle held by M. Hyacinthe, began smoking it with great composure.

'Sir,' ejaculated the alarmed M. Hyacinthe, endeavouring to smile, 'this is only some pleasant joke of yours. Remember the window is very high; you would not have the heart to throw a poor man from a fourth floor?'

But M. Renaudin said he had the heart to do anything; should feel extremely sorry when it was all over, but could not help it; had therefore thought it best to mention this weakness, as it would be more pleasant to both parties if nothing of the kind occurred. 'And now,' he added, 'that everything is explained, I think that, as I feel rather sleepy, you may leave me.'

'I cannot allow that,' uneasily exclaimed M. Hyacinthe; 'I must give notice to the police.'

'I scorn the police,' answered Renaudin with deep contempt.

'Sir,' indignantly exclaimed M. Hyacinthe, who was gradually edging towards the door, 'you fail in the respect due to the constituted authorities: your language is very illegal.'

'I delight in everything illegal,' was Renaudin's profane reply.

'Then, sir,' resolutely observed M. Hyacinthe, now on the landing, 'I shall alarm the house.'

'Do,' answered M. Renaudin: 'there will be noise, fighting, smashing of window-panes, &c.—things in which I rejoice—another trait in my character. But if you have a bone or two broken in the affray, do not say you received no warning.'

This was uttered with such suavity of manner, and the speaker had such a fair, meek face, of which the most prominent features were large eyes of a pale blue, a fat nose, and a retreating chin, that he did not seem the most likely individual to carry his threat into execution. But M. Hyacinthe, who never trusted to appearances when his safety was at stake, submitted, though not without a protest, and ended by putting the two Napoleons into his pocket, and leaving M. Renaudin master of the field of battle. Fear was not his only reason for acting thus: being a considerate man, he did not like to disturb a quiet house. Nor was he sorry to let his room to an individual who could afford to throw money out of the window; for though it is very well to discountenance extravagant people, every one knows that it is profitable to deal with them in the long-run. The next morning, however, M. Hyacinthe did not neglect, as soon as his lodger was gone out—for he would not have ventured to leave the house sooner, lest M. Renaudin should carry off something in his absence, though, save an old candlestick and a pair of snuffers, there was nothing portable in the room—to call on his late landlady.

Madame Sébillard gave M. Renaudin an excellent character for steadiness and propriety of conduct; but this only roused the suspicions of M. Hyacinthe, who shrewdly concluded that she wanted to get rid of her late lodger—a fact which afforded him another conclusive proof of the universal tendency which every individual had to cheat and deceive him. He resolved, however, to watch his lodger's motions so strictly, as to leave him few opportunities of effecting any mischief. But though his vigilance was most persevering, he could discover nothing reprehensible in the conduct of M. Renaudin. This singular individual went out early in the morning, and came home late at night, occasionally hinting in a dark and mysterious manner at certain deeds of guilt and horror in which he had been engaged during the day; but though M. Hyacinthe's hair 'stood on end to hear him,' as he elegantly expressed it, this was all he could learn, and every one agreed that the information was exceedingly vague. There was, however, a kind of fearful charm in Renaudin's conversation for the peaceful Hyacinthe; for though of course it was very shocking to hear his guest speak with unparalleled and revolting coldness of the innocent hearts he had broken through mere wantonness, and of the foes whom he had laid in mortal combat at his feet—without speaking of all the tailors' bills which he had never paid—every one knows that those are subjects of the most thrilling interest, as any modern romance or drama can show. No wonder, therefore, that M. Hyacinthe, being fond of the dark and dismal, was fascinated by the gloomy discourse of Renaudin. And indeed he was not the only person on whom this mysterious individual exercised an influence: every one in the house, from M. Moreau the landlord, who lived on the first floor, to the portress in her lodge, and the little tailor in his garret, declared that there was something very strange about him. M. Moreau, who, having once been a deputy, and voted against the freedom of the press,

thought himself a marked man, asserted that it would be prudent to turn him out of the house at once, as he was probably the spy of a gang of thieves or conspirators, both of which characters were in his opinion identical; Madame Latour called him a libertine and *mauvais sujet*, and strictly forbade her niece Minna to cast even a look upon him; the old tailor gave a very diffuse opinion, in which there was something about the degeneracy of human nature, and the cut of M. Renaudin's coat, which was not, it seems, at all orthodox. M. Hyacinthe, who knew most on the subject, said least; 'for,' as he sententially observed, 'walls had ears.' Occasionally, however, he ventured to observe that there was something fatal about his lodger's look—that he was, like Napoleon, a child of destiny, &c.—with which observations every one agreed, as being remarkably applicable to M. Renaudin.

But such, however, was the exemplary conduct of this strange individual, so regularly did he pay his rent, and so nearly did he, upon the whole, behave like other people, that every one began to think him a commonplace fellow, and some persons went so far as to complain that they had been taken in. But events showed that their murmurs had been premature, and Renaudin soon let them see what he could do. First, however, it should be known that Madame Latour's niece Minna was greatly dissatisfied with her lot, which was indeed none of the most enviable. From the unlimited freedom of a country life, she had been transplanted to the gloom and confinement of her aunt's lodge; for Madame Latour, not being able to go out with her niece, had prudently determined that she should remain at home. Minna soon grew pale and melancholy; and her wise aunt concluded that she had formed an attachment for some one in the house. But who could be the object of her affections? Was it M. Moreau? M. Hyacinthe? or the old tailor? Impossible! A flash of light crossed Madame Latour's mind—it was Renaudin! True, she had no proof of this; but suspicion is a powerful magnifying-glass, and it enabled her to read looks, and understand the meaning of certain words otherwise unintelligible. When she discovered, therefore, one fine morning, that her ungrateful niece had run away from her, she could have no doubt that it was with the artful Renaudin, on whom she immediately vowed to be revenged, should he presume to show his face again in the house, which every one declared to be extremely unlikely.

But Renaudin proved that he was capable of anything, for he came home at his usual hour. Madame Latour began the attack by asking him politely—and her politeness being very uncommon, always foreboded some deep insult—what he had done with her niece Minna? M. Renaudin looked surprised, and protested he knew nothing about her; upon which the portress sharply asked him if he thought she was blind, and had not observed the looks her niece cast upon him? M. Renaudin did not deny that the young lady might entertain a tender feeling for him, but asserted that he had never given her the least encouragement. This presumption greatly incensed Madame Latour, who immediately asked M. Renaudin what he meant by it, and without giving him time to reply, overwhelmed him with abuse. It was in vain that he opened his lips to answer her invectives by a word of self-defence; for every time that the portress paused in her speech, being out of breath—which was not often—the lodgers, who had gathered around her, took up the strain, and declared that M. Renaudin ought to be ashamed of himself to speak so of a poor girl who had given-up everything for him! But Renaudin was indeed Renaudin the obdurate; for he refused to confess his guilt, and contemptuously termed the fair Minna a *provinciale*. Madame Latour being now exhausted, became hysterical; and declared that her darling Minna being gone, she had nothing to live for. She partly revived, however, when her friends bade her rouse herself for the sake of her lodgers; and she even exerted herself so much, as to

promise M. Renaudin, who was now going up to his room, that she would soon be revenged upon him.

And faithfully, indeed, did she keep her word. During a whole week, her foe could neither leave nor enter the house without hearing himself reproached by Madame Latour, with the abduction of her niece. But hatred has quick instincts; and the portress soon perceived that the graceless Renaudin was rather flattered at being thus reminded of the impression he had produced on the too-susceptible heart of the fair Minna: she accordingly sought for a surer method of inflicting a wound, and soon found a very effectual one, which she practised thrice with great success. This was to sleep so soundly at night, that she never heard her enemy's knock at the door, and that consequently M. Renaudin had to spend the night in the open air, which, as the portress managed to be particularly drowsy in rainy weather, was not always very pleasant. Of course when he came in in the morning, M. Renaudin raved at Madame Latour in an awful manner, and uttered such fearful threats of vengeance, that the alarmed M. Hyacinthe assured her the whole affair would end in something dreadful. But the portress was a dauntless woman; she continued to brave the anger of her foe in the most fearless manner, and seemingly without suffering in consequence.

Punishment, indeed, seemed in this case to fall on the head of the guilty individual; for such was the persecution M. Renaudin sustained on the subject of Minna, that the unhappy gentleman declared, in a tone of despair, he would leave the house unless it ceased. From morning till night, indeed, he heard of nothing but Minna. The female lodgers looked upon him with evident horror; the men remonstrated with him; and even the timid M. Hyacinthe used the most persuasive arguments in order to induce him to give up Minna.

'Sir!' exclaimed M. Renaudin, rolling his blue eyes in a portentous manner, 'if I hear the name of Minna again, I shall do something desperate!'

As it did not escape M. Hyacinthe that his lodger, whilst speaking thus, grasped a small pocket-pistol which was lying on the table, he hastened to retreat; but when he had left the room, he said in a loud tone, though perhaps not quite loud enough to be heard, 'Hard-hearted wretch!'

But the circumstance of the pistol, which he had never seen before, nevertheless dwelt in his mind. What did his lodger want it for? A duel or a suicide? M. Hyacinthe inclined rather towards the latter supposition. It seemed exceedingly likely that something fatal had befallen the unhappy Minna, and in such a case it was only natural that the guilty Renaudin's mind should be burdened with remorse; and every one knows that, in such dark and mysterious characters, remorse leads to the most dreadful extremities. The more he thought on the subject, the more M. Hyacinthe became convinced that it was his lodger's intention to commit some rash act; and remembering, with the most disinterested humanity, that he owed him nearly two months' rent, he resolved to save him in spite of himself. He immediately communicated his suspicions to the portress and M. Moreau, who both appeared much startled on hearing of the pistol. The landlord especially seemed thrown into an unusual state of agitation. He treated the idea of a suicide with mysterious contempt, and darkly asked M. Hyacinthe if he had never heard of such things as political assassination, and pistol-shots being fired at marked men? After which he made some unintelligible allusion to a warning letter, but ended by declaring that the pistol should be secured by all means; and that, in order to prevent him from committing mischief, Renaudin should be locked up in his room. But who was to beard the lion in his den? The portress and M. Moreau agreed that M. Hyacinthe was the most fit person to be intrusted with such a task. This worthy individual, however, who entertained a most considerate regard for his personal safety, declared it would be as much as his life was

worth to undertake such an office, as he knew Renaudin would fight like a tiger; but he hinted something about M. Moreau's great moral courage, and Madame Latour being safe on account of her sex; upon which the landlord eyed him askance, muttering something about hidden accomplices, whilst the portress sharply asked 'if M. Hyacinthe wanted to get rid of her that way?' It was at length agreed that the deed should be effected by cunning. At dead of night, therefore, when every one in the house was safely in bed, and fast asleep, Madame Latour raised up an alarm of fire in most unearthly accents. The lodgers, being all warned, took no notice of the fact, with the exception of the luckless Renaudin, who flew out of his room, and rushed down stairs as pale and breathless as though it would not have been as sure a method of committing suicide to remain in bed whilst the house was on fire, as any other which he might adopt. M. Hyacinthe, who was lying in ambush on the landing, immediately darted into the room, pounced upon the pistol, which was still lying on the table, caught up a box of razors, and hurried off with his spoil to his own apartment. On discovering that the alarm was a false one, M. Renaudin, who only saw in this another method taken by his enemy the portress to annoy him, gave her a ferocious look, and walked up to his room. His ill-humour was too great to enable him to perceive his loss, and it luckily made him neglect to lock his door.

But the next morning M. Renaudin missed his razors, then his pistol, and ended by discovering that he was locked up. His cries soon brought M. Hyacinthe to his door. The worthy gentleman then explained to his lodger through the keyhole that he was to remain a prisoner until he could prove that he no longer entertained hostile designs against his own person, and might be trusted with a debt. He added, however, that if M. Renaudin would solemnly promise not to throw himself into the Seine, nor to leap down from the towers of Notre Dame, nor to destroy himself in any manner whatsoever; and if he would pay down to him, M. Hyacinthe, the two months' rent which he owed him, and another month's rent to which he was entitled, not having received warning, he would see what he could do in order to free him from his bondage in two or three days' time. These conditions were, however, indignantly rejected by M. Renaudin, who vowed that he would have justice if there was law in the land, and appealed to the police for protection. But M. Hyacinthe reminded him that, as he delighted in everything illegal, and scorned the police, he had no right to complain; and thus ended the conference.

After walking about his room for some time in a state of great indignation, M. Renaudin gradually cooled down, and requested to speak to M. Hyacinthe and M. Moreau. When they were both on the landing, he again demanded an explanation of their conduct. M. Hyacinthe replied by saying that a pistol had been found in his room, and by hinting something about the unhappy Minna.

'Minna again!' groaned the captive in a tone of despair; adding with reckless calmness, 'How long do you mean to keep me a prisoner, and when will you give me anything to eat?'

M. Hyacinthe pretended not to hear this last question; and after a good deal of hesitation, M. Moreau said something about feeding one's enemies, and promised to send up M. Renaudin his breakfast. This meal, however, only consisted of a cup of cold coffee, with a very scanty supply of bread; but such as it was, M. Moreau took the precaution of not delivering it to the captive without previously exacting from him a solemn promise of not attempting to escape for the whole of that day. M. Renaudin, who was hungry, would have promised anything, and readily complied with this condition; the more so, as M. Moreau artfully gave him to understand that he was going to get a *déjeuner à la fourchette*. When he saw the deceit which had been practised upon him, he gave vent to his irri-

tated feelings in bitter and gloomy language 'about blighted hopes, and people being driven to do desperate deeds.' M. Hyacinthe, who was listening on the landing, shuddered as he remembered that the window was not fastened; but Renaudin was probably too much bent on vengeance to think of self-destruction, for he quietly ate his bread, drank his coffee, and when a few hours had passed away, asked if dinner was ever going to come up, or if they meant to starve him. In answer to this question, a dish of onion soup, with cold mutton and bread, soon made their appearance; but on beholding this sorry fare, M. Renaudin became so indignant, that he threatened to break all the window-panes in his room. M. Hyacinthe, alarmed by this menace, pacified him by a dubious promise of mending his bill of fare the next day. As he was meditating, however, on the best means of eluding this engagement, an event occurred which relieved him from his embarrassment.

News were received of Minna, who had now been gone more than a week. The father of the fugitive wrote to apologise for the conduct of his daughter, who, unable to bear a longer absence from home, had returned to the bosom of her family. Madame Latour was greatly incensed by this explanation of the guilty Minna's conduct; and though the innocence of Renaudin was now clearly proved, she threw the whole blame upon him. Every one, indeed, felt disappointed at this commonplace conclusion, and, like the portress, found fault with the luckless Renaudin. They had got into the habit of associating his name with that of Minna—no longer the unhappy; they had looked upon him with suspicion and horror; he had been for them that favourite theatrical character—the traitor of the melodrama; and lo! he now turned out to be a false traitor! In short, M. Renaudin was now despised for not having committed the act which had drawn down persecution upon him. M. Hyacinthe himself, who, when pleading the cause of Minna, had termed his lodger 'a hard-hearted wretch!' no sooner found him to be innocent, than he contemptuously called him 'a mean and spiritless fellow!' M. Moreau was the only individual who showed no disappointment or surprise. 'He knew all along,' he observed, 'that Minna had nothing to do with Renaudin's presence in the house.' And he dropped such mysterious hints on the subject, that every one shrewdly concluded there must be something in it. On being informed by M. Hyacinthe of the turn the affair had taken, M. Renaudin naturally enough expected to be released from his captivity; but though his landlord told him that he was free, it struck M. Renaudin that there was something very peculiar in his manner as he did so. M. Hyacinthe's first act, when this explanation was over, was to request his lodger to pay him the two months' rent, which happened to be due that very same day. M. Renaudin threw him the money with silent scorn; but without heeding this, his landlord examined each piece of silver with minute attention, counted and recounted the sum, and at length, apparently satisfied that it was right, put it into his pocket. When this was over, he produced a small packet of papers, which he laid on the table before his lodger. M. Renaudin saw that the papers were the bills of different tradesmen, concerning heavy debts contracted towards them by a Monsieur de St Maur. After eyeing them one by one with a bewildered look, he asked an explanation of M. Hyacinthe; but his landlord affected not to understand him. 'Surely monsieur needed no explanation; tradespeople had come to inquire whether Monsieur de St Maur lived in the house; and though monsieur had changed his name, they gave such an accurate description of his person, that Madame Latour knew it must be he. He had nothing to do with the whole affair; and if the next time monsieur went out he was apprehended by the *gardes du commerce*, he could not prevent it.'

'Sir,' said M. Renaudin with a sort of desperate calmness, 'before we attempt to elucidate this new and mysterious affair, let me know whether I am to hear anything more about the unhappy Minna.'

M. Hyacinthe gravely replied that the Minna affair was over; on hearing which, his lodger thanked Heaven with great fervour—for he had felt it impossible to divest himself of secret misgivings on this point—and proceeded to inform him that he laboured under a mistake in supposing him to be Monsieur de St Maur. But M. Hyacinthe only smiled incredulously. 'It was no business of his, but monsieur could not expect him to believe this.' Such, however, seemed to be M. Renaudin's intention; but his efforts proved fruitless. M. Hyacinthe remained convinced that 'monsieur's real name was not Renaudin, and must consequently be St Maur. Monsieur had his private reasons for lodging in such a poor place as this; monsieur thought it shabby to pay his tailor; evidently monsieur was the individual in question.'

'Very well,' returned the exasperated Renaudin, 'I suppose I am Monsieur de St Maur. But granting this, what business is it of yours?' he fiercely added.

'Don't bully me, sir!' loftily observed M. Hyacinthe, making a dignified retreat towards the door. 'I am not one of your unfortunate tradesmen to bear with it. If you wish to leave this house, you can do so at once.'

'I protest against this,' exclaimed a voice from the landing; 'and I hope that if monsieur has anything like decent feeling left, he will wait for the arrival of the two police officers for whom I am going to send, and who cannot be long without making their appearance, and allow himself to be quietly taken to prison.'

'To prison!—police officers! Well, what have I done now?' asked Renaudin with a gloomy smile. 'Killed or murdered?'

'Monsieur Hyacinthe,' continued the voice on the landing, 'I call you to witness that he has confessed his horrible intent in the plainest terms! No, sir, you have not done the deed, but your design against my life was not the less criminal. I consider my escape a miraculous one!'

At the conclusion of this speech, M. Moreau, who was the speaker, ventured so far as to look into the room, though he prudently remained behind M. Hyacinthe, whose person acted as an effectual shield for his own.

'Now what does this mean?' wildly exclaimed the unhappy M. Renaudin.

'This means,' continued M. Moreau, 'that monsieur's real character and designs are now known; that there are such things as traitors among conspirators, and that people may receive letters by which they learn that they are going to be murdered; and though the name of the murderer may be concealed, monsieur will easily understand that there is no difficulty in guessing at it.'

The unhappy M. Renaudin heard this speech in the silence of dismay; but when it was over—'So,' he exclaimed, sinking down on a seat in a kind of solemn fury, 'so it seems no silly girl can run off, no madman squander his money, and no fool think himself a murdered man, but I must be the seducer, the spendthrift, and the assassin! Really, gentlemen, I am greatly obliged to you.'

'Sir,' dryly replied M. Hyacinthe, 'I had your character from your own lips; and events have shown that you were, as you boasted, remarkably sincere.'

M. Renaudin thrust his left hand into the opening of his waistcoat, and assumed the Napoleon attitude, in order to bid defiance to his enemies with more effect; but a bright thought seemed to flash across his mind, and he suddenly checked himself.

'Leave me,' said he in an authoritative tone; 'and let me have pen, ink, and paper: there is that on my mind which must be revealed. Yes,' he solemnly added, 'all shall be confessed. But remember,' he continued in a menacing tone, 'to let no one even approach the door of this room, or linger on the staircase, until half an hour at least has elapsed.'

Fear and curiosity induced M. Moreau and M. Hyacinthe to comply with this request; for the former was fully convinced that the alarmed Renaudin was going

to sacrifice his friends to his safety, and reckoned on the names of a dozen accomplices at the very least; whilst M. Hyacinthe gloomily congratulated himself on the tale of horror which his lodger was going to unfold. A lingering feeling of suspicion, however, induced them to remain on the first floor landing until the half hour was over, when they impatiently hurried up stairs. Renaudin's room door was partly open, and M. Hyacinthe cautiously peeped in. A light was burning on the table, and a letter was lying near it; but Renaudin had vanished. The truth flashed across his mind; he rushed in, tore the letter open, and read its contents aloud:—

'The manifold persecutions which I have endured in this house, compel me to retire from the shelter of its inhospitable roof, as I feel convinced that designs against either my life or property are entertained by certain individuals who dwell beneath it. All I say to my persecutors is, that they may live to repent of their conduct.'

'Monsieur Hyacinthe,' exclaimed M. Moreau in a prophetic tone, 'mark my words—I am a dead man; and he retired to his apartment with the heroic air of a man resigned to the prospect of being shot at the first opportunity.

But M. Hyacinthe's personal fears were outweighed on this occasion by his curiosity, which was greatly excited by Renaudin's mysterious disappearance. Madame Latour's assertion, that the fugitive had effected his escape by going down a back staircase, and opening the street door whilst she was asleep in her lodge, he always treated with the contempt which such a commonplace explanation deserved. Indeed M. Hyacinthe would have been rather sorry to find out the truth. As his late lodger owed him nothing, and had done him no real injury, he found it pleasant, upon the whole, to have been connected with such a fearful and desperate character. There was, as he poetically expressed it, 'a horrid charm in it, and food for the imagination.' Fate, however, seemed perversely bent on dispelling the romance and mystery with which he had invested Renaudin, and to show this luckless individual in the most commonplace aspect. In the first place, it was ascertained shortly after his disappearance that he was not M. de St Maur; then, as though this was not bad enough, M. Hyacinthe discovered amongst the few articles which his lodger had left behind him a small book, from which he learned that M. Renaudin had 1500 francs in the savings' bank—a mean and paltry piece of economy, which made M. Hyacinthe justly indignant, as affording another proof of the gross manner in which he had been taken in. He was still smarting under the mortification of this discovery, when a friend of his treacherous lodger came to claim, in his name, the pistol—which also turned out to be a mere counterfeit, as, whether loaded with powder or lead, it would not go off—the razors, and the book. M. Hyacinthe delivered up the articles with a hope that this was the last time he should hear of their owner. Such, however, was not to be the case, for the very same day Madame Latour triumphantly asked him if he knew who Renaudin was? M. Hyacinthe said 'No,' with the air of a man resigned to anything he may hear.

'I got it all out of his friend!' exclaimed the portress with evident exultation. 'He is—a hairdresser!'

M. Hyacinthe was at first stunned by this new blow: the splendid, the extravagant, the terrible Renaudin a hairdresser! But no: it could not be: he would not believe it. But, alas! even his scepticism was obliged to yield to the evidence of his senses; for the hairdresser to whose establishment the redoubtable Renaudin belonged, took a shop in a neighbouring street, so that longer doubt was impossible. There have been, however, such things as romantic hairdressers; but though M. Hyacinthe fancied for a time that Renaudin might belong to that class, this was a short-lived illusion. The young man, according to the universal testimony, led a most exemplary life: instead of going

to drink or dance at the barrier, he spent his Sundays with his family, occasionally indulging in the harmless amusement of taking out his sisters for a walk. On learning these circumstances, M. Hyacinthe bitterly declared that 'he gave him up.' His only comfort under this trying dispensation was, that Renaudin afforded a living proof of the tendency which made every individual seek to cheat and deceive him.

There is no knowing how M. Moreau might have acted under the influence of the dangerous neighbourhood in which he was now placed, if he had not discovered about this time that the anonymous letter which had caused him so much alarm was only a practical joke of one of his friends—a fact which he took in high dudgeon. As for M. Renaudin, he seemed to bear very philosophically the degrading position to which he was reduced in the eyes of his former acquaintances. Perhaps he had learned, from personal experience, that though it is very fine and agreeable to be thought a desperate sort of character, it occasionally happens to be inconvenient, as there are simple people who will take you at your word, whatever ill qualities you may bestow on yourself. However that may be, it will perhaps be gratifying to the reader to state, that Renaudin continues to be the same exemplary character he always was; he has forsworn all ambitious thoughts, and is satisfied with being considered one of the most prudent, economical, and gentle professors of his gentle craft.

THE DINORNIS.

In the year 1839, a sailor on board a New Zealand ship brought to London a fragment of an old bone, which, according to his statement, was declared by the natives of that country to be part of the leg-bone of the 'Movie,' a large bird of the eagle kind, and that similar remains were often found in the mud-banks at the mouths of rivers. The relic was offered for sale at various scientific institutions, but was rejected by the naturalists who examined it, as being nothing more than a portion of the marrow-bone of an ox, or some analogous quadruped. At last it reached the hands of Professor Owen at the Royal College of Surgeons: this skillful anatomist compared it with the bones of various mammalia, but found no correspondence between them; further examination of the structure of the fragment led him to pronounce it to be part of the thigh-bone of a *Struthious** bird, or bird of the ostrich genus. The specimen, which was not more than six inches long, and weighed but a little over seven ounces, was sufficient to enable the professor to predicate on the nature of the animal to which it had belonged; and he described the latter as having been a heavier and more sluggish bird than the ostrich of the present day, offering at the same time, in the communication which he made on the subject to the Zoological Society, to stake his reputation on the correctness of his conclusions. Thus, on a comparatively insignificant piece of bone, was the existence, either actual or recent, of an extraordinary bird affirmed; a remarkable triumph of reason, combined with a habit of correct observation.

In 1843, a letter received from one of the missionaries resident in New Zealand gave some further information on this interesting subject. The writer stated that he had seen large quantities of the bones, numerous specimens of which had been forwarded to an eminent geologist in this country. At a search made, with the assistance of the natives, the bones of as many as thirty birds were collected: the largest of these measured two feet ten inches long. They were described as having been found in abundance at Poverty Bay; and according to the same authority, many singular traditions respecting the bird, which was called the *Moa*, were current among the aborigines. They held it to be sacred, and reported it to be still in existence in the

* See a sketch of the family *Struthionidae*, in No. 613, old series.

sacred district of Tongariro, and the mountains of the middle island. 'Two Englishmen,' pursued the writer, 'had been taken out by a native at night to watch for the bird which he had described to them; they saw it, but were so frightened, that they did not dare to shoot at it, though they had gone out expressly to do so.' Notwithstanding frequent rumours of the birds being still alive, subsequent researches have rendered it probable that their extinction took place more than a century ago.

On the arrival of the bones referred to in the letter quoted above, they were transferred to Mr Owen, who, with the multiplied materials thus placed at his command, was enabled to produce a complete figure of the animal in a drawing. So extraordinary was its stature, that he proposed for it the name of *Dinornis*, from two Greek words signifying frightful bird. The conclusions which the professor had drawn were abundantly verified; the species was found to be distinct from any other large bird with which we are acquainted. 'Its dimensions,' he writes, 'prove the *dinornis* of New Zealand to be the most gigantic of known birds. There is little probability that it will ever be found, whether living or extinct, in any other part of the world than the islands of New Zealand or parts adjacent. At all events, the *Dinornis Nova Zelandiae* will always remain one of the most extraordinary of the zoological facts in the history of those islands; and it may not be saying too much to characterise it as one of the most remarkable acquisitions to zoology in general which the present century has produced.'

That the bones were of comparatively recent date, was proved by their containing a large amount of animal matter, with no appearances of petrification, as seen in fossils generally. Five distinct species have been fully made out, the largest of which, *Dinornis giganteus*, must have stood ten feet in height, with a foot from twelve to sixteen inches in length. Others were seven and four feet high. It is an interesting fact, that a link connecting these extinct tribes with the present time is yet to be found living in New Zealand. The apteryx, or wingless bird of that country, dwindled down to the size of a turkey, remains the last representative of the moa race, destined in turn speedily to disappear, as it is much sought after for its feathers, which are used to decorate the persons of the chiefs. The bird is at the present time extremely rare, and making its appearance only at night, is very difficult of capture.

The arrival of a large quantity of bones during the past year, has greatly increased the interest on the subject of the *dinornis*. They have been made the subject of a lecture, delivered at the London Institution by Dr Mantell, whose son collected and forwarded the bones to England. The writer was among those fortunate enough to be present at the doctor's exposition, an outline of which imparts a general view of what is known respecting the extinct birds. The lecturer had received a letter from his son but two days previously to the public discourse, and was enabled, among his other diagrams, to exhibit a view of the New Zealand coast from Wanganui to New Plymouth, in which district the bones are found in the greatest abundance, and chiefly on the banks of a small river which descends from the rocky heights of Mount Egmont. This portion of the island-shore appears to have been considerably upheaved at no very remote period, as the banks of the river near its mouth are one hundred feet high, the base consisting of a blue clay, covered with a layer of sand five or six feet in thickness, above which, to the surface, is a mass of conglomerate. It is in the layer of sand that the bones of the moa are found. Had it been necessary to dig down through the bed of conglomerate, they would not repay the labour; but in one part of its course the river makes a sharp bend round a peninsulated area, composed of drift, and free from superincumbent rocks. Mr Mantell's excavations in this place were well rewarded by the discovery of more than seven hundred bones; many of these were lying on the table

in front of the lecturer, and their dimensions more than confirmed all that had been previously advanced by Professor Owen. An entire skeleton, it was stated, would have been secured, but for the opposition of the natives, who crowded round the excavators, and destroyed the relics as fast as they were exhumed. The work of destruction was the more easy, as the bones were found in a soft state, owing to the wet condition of the sand in which they were imbedded. In his recent work on the Geology of Russia, Sir R. Murchison records a similar instance of opposition on the part of the Bashkirs, who protested against the removal of mammoth bones from their territories. It was only by working early in the morning, and late in the evening, when no natives were present, that Mr Mantell was able to obtain the bones with which he has enriched the science of this country. Dr Mantell states that the birds must have been exceedingly numerous, roaming over the island in 'swarms,' the largest of them with a length of stride from six to seven feet. His drawing of the entire animal, ten feet in height, presented an interesting specimen of nature's handiwork on a gigantic scale. He described the adze-like form of the bill, and the peculiar conformation of the skull in its union with the neck, the muscular power of which must have been tremendous, rendering it easy for the bird to dig up the roots of esculent ferns, which in all probability formed its food, and which are still among the principal vegetable productions of the country.

In addition to the bones, numerous portions of eggshells of the moa have been discovered; these present all the appearance of having been for some time exposed to the action of running water. The original size of the egg, as stated by the lecturer, was such that a hat would have formed a suitable egg-cup. The fragments are of a light cream colour; and the structure of the shell, which is relatively thin, is altogether different from that of the ostrich and emu. To some of the specimens a portion of the interior membrane was still adherent, showing that a young bird had been hatched within them in the usual way.

In the course of the lecture, Dr Mantell adverted to the objections which have from time to time been made to the fact of the disappearance of certain races of animals from the earth. It is, however, unquestionable, that in the changes which the crust of our globe has undergone, many have become extinct, or have been exterminated by human agency. Even in countries where no convulsion has taken place during the current era, species have passed away, and been replaced by others, as it were in obedience to a definite natural law, under which certain races were endowed with a power of existence for a definite period only. In our own country, the hyena, wolf, wild-boar, beaver, bear, and Irish elk, are among the most remarkable instances of comparatively recent extinction.

Another important instance occurs in the history of that singular bird the dodo. When the Mauritius was first colonised by the Dutch about the year 1640, this bird was found in great numbers in that group of islands, and was for a long time the chief food of the inhabitants. In 1638, a dodo was exhibited in London as a notable curiosity; and in Savery's picture of 'Orpheus Charming the Beasts,' preserved at the Hague, is a drawing of the bird; but at the present time a few fragments only are known to be in existence—a head and foot at the Ashmolean Museum, a leg in the British Museum, and a skull in the museum at Copenhagen. This fact, occurring at so recent a period, amply confirms the arguments brought forward with respect to the law of extinction. It is probable that the disappearance of the moa preceded that of the dodo; both, however, may have taken place within the past hundred and fifty years.

The lecturer, in conclusion, pointed out the remarkable fact, that no native quadruped has ever been found in New Zealand; and that the present indigenous vegetable productions of the country are similar to those

which existed in earlier periods of geological history—the carboniferous and triassic eras—in Europe and other parts of the world, before the appearance of mammalia. The Galapagos Islands, too, lying in the Pacific Ocean, as described by Mr Darwin, furnish another most interesting example; a living specimen, so to speak, of one of the earth's former conditions—the reptile age of the secondary period. The islands are about ten in number, the largest a hundred miles long, and consist entirely of volcanic rocks. In the whole group there are two thousand craters, some of immense height, and still smoking. Everything about these islands is peculiar, and without a parallel elsewhere: the vegetation is chiefly coarse grass and ferns; a mouse is the only mammal, and this is confined to one of the islands; the birds are such as are never met with in other countries, while enormous tortoises and lizards exist in thousands. In fact, to quote Mr Darwin's words, 'this Archipelago is a little world within itself: most of the organic productions are aboriginal creations, found nowhere else. Seeing every height crowned with its crater, and the boundaries of most of the lava-streams still distinct, we are led to believe that, within a period geologically recent, the unbroken ocean was here spread out. Hence, both in time and space, we seem to be brought somewhat near to that great fact—that mystery of mysteries—the first appearance of new beings on this earth.'

DIPPINGS INTO OLD MAGAZINES.

THE GENTLEMAN'S FOR 1748.

THE original idea of a magazine was—a receptacle for selections from the newspapers. They were received here, as into a storehouse or *magazine*, and thus redeemed from the ephemeral destiny to which the remaining matters of the public journals were condemned. The 'Gentleman's Magazine,' commenced in 1731 by Edward Cave, and for many years without any worthy rival in this walk of literature, had on its front, besides the well-known rude cut of St John's Gate, Clerkenwell (where Cave had his printing-office), the list of London and provincial papers from which the selection was made. This work, however, was also furnished with original literary articles, in prose and poetry; and seldom did a number appear without one or more engravings, some of these being maps, some of them representations of public buildings, or objects of antiquity, while others depicted new inventions in the useful arts.

The volume for 1748 shows in a sufficiently striking manner the change which has come over magazines in the course of a hundred years. Its dark paper, coarse print, and homely engravings, strike the eye at once as in strong contrast with the externals of the nominally same class of works in the present day. The literary contents are in equally violent contrast, though perhaps the superiority of the modern over the ancient is here less certain. At least we think it might be contended, that if the magazine of 1748 is full of homely and simple matters, few of which ascend to the character of elegant literature, that of 1848 is marked by straining after effect, which is by no means calculated to give greater pleasure to a sound taste. The old work addresses itself to the time. It gives accounts of places where armies or fleets are operating. It overlooks nothing new in science or art. It chronicles all great men deceased, and forms a faithful register of events, which obviously may afterwards be referred to with advantage. It seems to us highly questionable if the neglect of these matters, for the sake of filling the brochure from end to end with extravagant fictions, and long political discussions, is an improvement in the modern magazines. We fear that the magazine has departed from the spirit of its mission in some degree.

At the commencement of the 'Gentleman's' in 1748, we have a treatise on short-hand writing; an edict of the

magistrates of Reading against profane swearing; and an exposure of poor Carte's unlucky account of the cure of king's evil, by the touch of the so-called Pretender. Then follow extracts from the memoirs of the Swedish Academy, making honourable mention of the writings of Linnæus, which must have been new at that time to England. One of the first things of a strongly characteristic nature which meets us, is a remonstrance from Holland, setting forth that the want of corn in France is a thing notorious; that to keep up the famine there, is a point of great consequence to the powers at war with France; that, nevertheless, British merchants are busy introducing corn there, for which they get large prices. 'Sure,' says this precious document, 'there can be no law too severe against such traitors to their country. This is a matter which ought to fall under the examination of his Britannic majesty's council, too wise and too prudent not to discern what mischief the transporting of corn and other provisions into France does to the common cause; more mischief, we may boldly say, than all the troops which Great Britain has in the Low Countries can do good.' Follows upon this a letter from an Honest Farmer, who, though not insensible of the benefit of a good market for the superabundant grain in England, manfully declares—'Though I have a pretty large stock by me, I'd sooner send it to the bottom of my pond, or turn it out into the yard to feed the sparrows (one of our greatest plagues), than let one grain go to help a Frenchman from starving.' The reality of the whole matter is shown by a proclamation given at St James's on the 19th February, to 'strictly prohibit and forbid all our subjects of Great Britain, Ireland, Jersey, Guernsey, Alderney, Sark, Isle of Man, Minorca, and the town and port of Gibraltar, and of any of our colonies and plantations in America, and all our other dominions, that they do not directly or indirectly carry on any commerce, trade, or traffic with France, or any other of the dominions of the said French king, upon pain of our highest displeasure.' We suppose this would be so far effectual, though it would appear that the instincts of the country gentlemen showed a considerable inclination to stand up for the feeding of the national enemies, on the score of its beneficial effect in enabling the farmers to pay their taxes, so as the better to support active hostilities against France.

Some curious traits of domestic manners are presented throughout these pages. There is an epigram 'On the Ladies Chewing Tobacco.'

* * *
'A sweeter weed Virginia yields
Than grows in all Arabia's fields.
Bright Beauty's queen no longer loves
The posy plucked from myrtle groves;
And alights the flowers of Cyprus' isle,
For the odorous plant of Indian soil;
For well she knows she owes to this
The balmy breath, the ambrosial kiss.'

Several references are made to the Pantin, a kind of toy in the form of a paper puppet, which was then newly introduced to use among British dames, being an invention of Mademoiselle Pantine, 'one of Marshal Saxe's ladies.' It is spoken of as 'what former ages could never have dreamt of, what posterity will hardly believe—a piece of pasteboard, huddled into a head, arms, and legs, is found to be a proper subject of entertainment for a creature always thought something above a machine or a brute.' While the peace was negotiating at Aix-la-Chapelle, there appears a song on this piece of frivolity:—

'I sing not of battles that now are to cease,
Nor carols my muse in the praise of a peace;
To show that she's oft in good company been,
She humbly begs leave to sing Monsieur Pantin.

... pray observe that strange thing made for show,
That compound of powder and nonsense, a beau;
So limber his joints, and so strange is his mien,
That you cry as he walks, look you there's a Pantin!

How oft have we heard that the ladies love change,
And from one entertainment to t'other will range;
In this they are constant, what difference was seen,
When they laid down the fribble, and took the Pantin?"

Rather oddly, that chequered cloth, called in its own country tartan, but which the people of England insist on calling *plaid*—which is much the same as if they were to call velvet by the term *coat collar*—was at this time in fashion, while the legislature was endeavouring to suppress it in Scotland, as a symbol and stimulator of rebellion. It seems to have been assumed as a safe method of expressing favour for a cause past all other befriending. Euryalus lashes the modern *plaid*-wearers in the following somewhat pithy strains:—

'What do I see! ridiculously clad
Our English beaus and belles in Highland plaid,
The dress of rebels, by our laws forbid!
No matter—why should friends or foes be hid?
By this distinctive badge are traitors shown,
Sure as freemasons by their signals known.
Yet say, ye dastards, who in peaceful days
Look big, drink healths, and hope a traitor's praise,
In what dark corner did ye lurk, when late
To the last crisis Edward pushed his fate?
Skulking behind the laws ye wished to break,
Ye dared risk nothing for your prince's sake;
Tameless ye saw his promised succours fall,
And William's arms, like Aaron's rod, prevail.
True to no side, ye bats of human kind,
Despised by both, for public scorn designed,
Still by your dress distinguished from the rest,
Be James's sorrow, and be George's jest.'

A few particulars regarding the unfortunate partisans of the House of Stuart are scattered here and there. We hear of the pardoned Earl of Cromarty going to reside at that place in Devonshire in which he was condemned to spend the remainder of his life. (What a punishment, by the way, for a Ross-shire man!) The death of Cameron of Lochiel is mentioned, 'colonel of a regiment in the French service, composed of Camerons and other rebels.' A writer in the *Daily Advertiser*, speculating on the means of employing the discharged seamen of the navy, is strong for planting them as fishers in the Highlands, and giving them a bounty of five shillings on every barrel of herrings—a branch of industry which 'would people and cultivate those wastes in Scotland which are only a harbour at present for the barbarous clans, who are bred up in ignorance, poverty, and dependence, and are the scandal, as well as a nuisance, to their mother country.' At the peace, Prince Charles Edward is forced to leave France, in order to please the British government. The French king writes to the Swiss canton of Friburg, asking an asylum for him, which was granted. Up then starts Mr Barnaby, the English minister to the Swiss cantons, and expresses to the Magnificent Lords of Friburg the astonishment of the king of Great Britain at learning that they were to give refuge to the Pretender's eldest son, 'whose race is odious to all British subjects, and proscribed by the laws of Great Britain.' 'Such a step on your part, without the participation of your co-allies, would be a pretty odd contrast to the cordial expressions, so full of gratitude, contained in the letter which the laudable Helvetic body so lately wrote to his majesty!' Helvetic flesh and blood could not stand the insolence of the remonstrance, and they accordingly wrote to Mr Barnaby, that his letter 'was drawn up in terms of so little respect, and so improper to be addressed to a sovereign state, that we think it deserves no answer.' After all, the poor prince preferred taking up his residence in the pope's city of Avignon.

A curious illustration of a national, and we fear persevering foible, is given in the form of a *Pharmacopœa Empirica*, a list of quack medicines then in vogue, two hundred and two in number, specifying their professed objects, their inventors and patentees, and their prices. These last do not appear low in comparison with the cost of such articles in the present day: many are 5s., and even 10s. 6d. per box or bottle. Dr Belloc's pills for rheumatism (!) are 20s. a box, and Mr Parker's for the stone

2s. 6d. a pill. Two hundred and two quack medicines, what a battery against the stomach and the pocket of poor Jean Bull! But this was not the only form of delusion about health. A number of reports are given from country correspondents regarding a certain Bridget Bostock, a poor old woman living in a hovel near Namptwich in Cheshire, and who was believed to be able to cure all diseases. One gentleman makes the following statement:—'Old Bridget Bostock fills the country with as much talk as the rebels did. She hath, all her lifetime, made it her business to cure her neighbours of sore legs and other disorders; but her reputation seems now so wonderfully to increase, that people come to her from far and near. A year ago she had, as I remember, about forty under her care, which I found afterwards increased to one hundred a-week, and then to one hundred and sixty. Sunday se'nnight, after dinner, my wife and I went to this doctress' house, and were told by Mr S— and Tom M—, who kept the door, and let people in by fives and sixes, that they had that day told six hundred she had administered to, besides her making a cheese. She at length grew so very faint (for she never breaks her fast till she has done), that at six o'clock she was obliged to give over, though there were then more than sixty persons whom she had not meddled with. Monday last she had seven hundred, and every day now pretty near that number. She cures the blind, the deaf, the lame of all sorts, the rheumatic, king's evil, hysteric fits, falling fits, shortness of breath, dropsy, palsy, leprosy, cancers, and, in short, almost everything; and all the means she uses for cure are only stroking with fasting spittle, and praying for them. It is hardly credible to think what cures she daily performs: some people grow well whilst in the house, others on the road home, and it is said none miss. People come sixty miles round. In our lane, where there have not been two coaches seen before these twelve years, now three or four pass in a day, and the poor come by cart-loads. She is about seventy years of age, and keeps old Bostock's house, who allowed her thirty-five shillings a-year wages; and though money is offered her, yet she takes none for her cures. Her dress is very plain: she wears a flannel waistcoat, a green linsey apron, a pair of clogs, and a plain cap, tied with a halfpenny lace. So many people of fashion come now to her, that several of the poor country people make a comfortable subsistence by holding their horses. In short, the poor, the rich, the lame, the blind, and the deaf, all pray for her, and bless her, but the doctors curse her.'

The lists of marriages and deaths are well worth looking over. In the former case, when the lady has any fortune, it is always stated: thus, 'Vilters, Earle of Tedbury, Esq., to Miss Sterling of Newington, 20,000l.' Nor are personal charms overlooked: '— Sydney, Esq. of Cranfield, Derbyshire, to Miss Sutton, a celebrated beauty, 10,000l.' In the obituary, wealth is also duly noted: thus, 'Mr Halsey, master of a glass-house at Limehouse, worth 50,000l.' or, 'Thomas Walker, Esq. surveyor-general, worth 300,000l.' The legacies of deceased persons to public charities are always recorded. Sometimes a historical name illumines the page with association, as, 'Mrs Bracegirdle, a celebrated actress of the reigns of Charles II. and James II., but had since retired to live on her fortune; or, 'Mr James Thomson, the celebrated author of the *Seasons*, &c. at his dwelling, Richmond, Surrey, of a violent fever. His inoffensive, benevolent disposition, and excellent genius, make his death a public loss.' In the following notice, our attention is called to one whose name will ever be recollected in connection with a useful public service: 'March 7, Rt. Hon. George Wade, Esq. field-marshal of his Majesty's forces, Lieutenant-general of the ordnance, and of his Majesty's Privy-Council, aged 80. His first commission bore date Dec. 26, 1690, whence he rose, under four succeeding reigns, to the highest honours of his profession. . . . In 1724 he commanded in Scotland, and made the roads through the High-

lands. . . . He died worth above 100,000!.' Everybody must remember the Irish officer's distich on the works of this great marshal—

'Had you seen these roads before they were made,
You'd have lifted up your hands, and blessed General Wade.'

THE POOR THE FRIENDS OF THE POOR.

EVERY one who really wishes well to the labouring classes, must equally rejoice when he hears of what is creditable to them, and deplore the reverse. We have heard much of late years of kindness shown by the poor to each other; and for our part, we would rather hear of one act of genuine courtesy and help performed by one humble family to another living on the same *stair-head*, and struck by poverty or sorrow, than be told of the most generous benefaction from a rich man towards a public charity, however well-timed, or however directly serviceable. It were, however, vain to attempt to prove any peculiar limitation of generosity to classes. It is just as true that there is much liberality among the more affluent classes towards the poor, as amongst the poor towards each other; and it is not more certain that the poor find oppressors among the rich, than that they find such among themselves.

A gentleman of humane and liberal disposition, conversing with us on these points, remarked—'One day, not above a week ago, I had a curious series of practical commentaries brought before me, on the notion which some entertain as to who are the sources of misery to the poor. Walking out in the morning, I observed a washerwoman bending under a heavy load at a little distance before me. She had stopped at the bottom of a short flight of steps leading up to the door of what we in Edinburgh call a common stair, where there was a bell and a small name-plate for each family living in the house. As I approached, she asked a working lad who was passing to go up and see if the name of a particular family was among these plates. Not doubting that he would do so, I passed on, but presently looking back, I observed the lad lounging carelessly along, while the poor overladen woman was slowly toiling up the flight of steps to ascertain the fact for herself. I need not say that I lamented being out of time to save the woman the perhaps needless trouble. In the course of the day, a person in extremely reduced circumstances called upon me to interst, for the sake of old acquaintance, a small sum to save his remains of furniture from a landlord of his own grade. In the evening, as I was going home through the dark and rainy streets, I passed a mendicant boy who was endeavouring to excite the compassion of the passengers. Several boys of the humbler class were standing by, mocking him. When I had gone on thirty yards, I heard a cry of genuine distress. It came from the beggar, upon whom I found a couple of the boys had fallen with their fists, apparently through mere wantonness. Alas, thought I, for the kindness of the poor to the poor! From this one day's observations, it would appear to be a rule not without heavy exceptions.'

Another friend, who has extensive connections with working men, remarked to us one day, of his own accord, how often he found instances of oppression exercised towards them by persons of their own grade. He related an instance of the conduct of a man who kept a tavern, in recovering a debt from a very unfortunate person whom the law had placed in his power, entirely against the spirit of equity; it was such as to excite the greatest indignation. On the other hand, the sufferings of small dealers from reckless conduct on the

part of their customers are often very great. The owner of a number of dwellings of a humble kind informs us that the falsehoods and evasions employed by his tenants to avoid paying him any rent, would scarcely be credited by persons unacquainted with the lower walks of life.

Mr Frederick Hill, in his pamphlet on the 'Economic Defence of the Country,' adduces a class of mischiefs which his official duty has brought strongly under his notice. 'Though happily,' he says, 'the leaders in these [trades'] unions are now gradually losing their power by the increased diffusion of intelligence and knowledge, I am convinced that the rules of these unions, and the measures taken to enforce them, still form the greatest tyranny in the country. Indeed even the Irish outrages may be traced to the same principle on which so many trades' unions act—a determination to force upon others, even by the most violent means, their own views of what is just, or at least of what is conducive to their own interests.'

'If the masters, however, suffer by such tyranny, it presses with increased weight upon the more unprotected workpeople.

'The following statement was lately made to me by an inmate of the county prison at Kirkdale, near Liverpool; and the chaplain of the prison stated that, from his knowledge of the man, he should believe what he said:—"I am a collier. I was born at St Helen's, and have lived there most of my life. I have been three times in prison, each time for stealing. I was driven each time by want to steal. I have sometimes been two or three days without anything to eat. I applied several times to the parish, but they would not do anything for me. . . . I could not get any work, because I did not belong to the union. The masters would have employed me, but the men would not let them. Every man, when he first joins the union, has to pay a guinea, and I had not the money. I was anxious to work, but I was not allowed. I had got out of the union in consequence of getting behind with my union money, and not being able to pay up. I had been ill for some time, and could not work, or earn any money." The chaplain of this prison added, that within the last two or three years two sawyers had been murdered, in consequence of their continuing to work contrary to the orders of one of the unions.

'The following statement was lately made to me by the superintendent of police at Sheffield, who said that he could occupy the whole day in reciting similar cases:—"Some of the unions, he stated, forbid those employed at their trade, whether in the unions or not, to work more than a certain number of days per week, and restrict them to a certain number of hours on those days. The following case he mentioned as illustrative of the evils arising from this tyrannical interference with the liberties of others:—"Some time ago, a Sheffield manufacturer received a large order from America, which he was required to complete by a certain time, the goods having to be despatched by a particular vessel. The last day of the term had arrived, and the work was nearly finished, when, at four o'clock (the day being Saturday), the foreman came to the manufacturer, and told him that the men were leaving their work, and that the goods would not be finished in time. The manufacturer directed that the men should be immediately assembled, and he told them that if they went before the work was completed, he should lose several thousand pounds. He said they knew that a few hours would be sufficient for all that remained to be done, and

that he must insist upon their completing their task. He reminded them that he had always been considerate of their interests; and said it was monstrous that in a case in which he had so large a stake, his own interest should be set at naught, and this, too, when he was willing to give them the full value of every stroke of work they performed. He added, that if they persisted in quitting the manufactory at that hour, and leaving the work unfinished, not one of them should ever return, be the consequence to himself what it might. The men replied that they knew he had always been a kind master to them, but that they were not allowed by the union to work after four o'clock on Saturday afternoon; they added, however, that if he would give them a little time to discuss the matter, they would think whether anything could be done. The manufacturer consented to this, and allowed them ten minutes to come to a determination. At the end of that time the men sent a deputation to him, to say that they had resolved to go on with the work, provided he would undertake to protect them from attack—recommending that he should also take measures for protecting himself. The manufacturer replied that he would do his best; and he sent immediately for the superintendent of police to consult with him. The superintendent promised to give the protection required, and for that purpose was obliged to station a police-officer near the house of each of the workmen belonging to the manufactory; and these officers guarded the men to and from their work. This went on for some months; but at length the workmen being weary of such a state of danger and trammel, their employer consented to pay a large fine to the union as a penalty for their offence, on condition that they should no longer be exposed to persecution.

While we now write, the following passage appears in a newspaper, as from a Parisian correspondent:—'Vast numbers of English—domestic servants, operatives, labourers, and others, with their families—are at present being dismissed from their employment in France. Remonstrance against this ungenerous act is useless. Employers have no fault to find with the English, and they indeed have preferred them as assistants, from some peculiar skill or steadiness which they possess; but they dare not keep them, being threatened with personal injury by the French workmen if they do not at once dismiss all the English from their service.'

When from the generous heart of Robert Burns there broke the never-to-be-forgotten verse—

'See yonder poor, o'erlaboured wight,
So abject, mean, and vile,
Who begs a brother of the earth
To give him leave to toil;
And see his lordly fellow-worm
The poor petition spurn,
Unmindful though a weeping wife
And helpless offspring mourn'—

it never occurred to him, as a possible form of the inhumanity, that the 'o'erlaboured wight' might be forbidden to work by persons of his own condition, exercising a force not resting on law or natural right, but merely on the arbitrary will of a majority, and directly subversive of the freedom of the individual.

These are, we think, honest truths, and, we hope, not unkindly spoken. It seems to us as if the humbly industrious classes could immensely advance and improve their condition if they understood it better, and could more truly be their own friends. A carman passes through a herd of cattle on a street, and taking little trouble to avoid disturbing or dispersing them, gives great annoyance to the drivers, who immediately let loose their rude tongues against him. An altercation, full of horrible language, is the consequence, by which the tempers of both parties are exasperated. Perhaps they even proceed to blows. Now there is nothing to hinder a carman and a driver of cattle from conducting their respective businesses with a civil and forbearing regard to each other, and thus adding to, instead of subtracting from, the comfort of their lives. If a dif-

ficulty unexpectedly should take place, there is nothing to prevent its being remonstrated with gently, and politely apologised for. Why should these helps to happiness be the exclusive privilege of gentlemen? If, again, any one attempts to oppress or take undue advantage of another, there is no reason why the public opinion of the class should not be brought to bear on the case, so as to right and protect the injured party. It is a great mistake, this constant looking up in blame, or with demands for justice, for it merely applies the flattering unction of an illusive belief that we are ourselves entirely right. A man remains poor all his days, because of a notion that there is a class who will not allow him to be otherwise, when the real fault is with himself. He refrains from attempting practical reforms in his circle and sphere, under a notion that some great reform, including all such little matters, should be wrought by some other people, who, however, neglect or fail in their duty. These are deplorable delusions, the real enemies to every kind of advancement. It is vain to expect much from others while we do nothing ourselves, for every class has its own interests to take up its time and thoughts, just as the working-classes have; and when it is otherwise, human nature must have changed. Man is a strange phenomenon in the midst of many. It seems as nothing were truly impossible to his justly-formed wishes and his well-directed efforts. On the other hand, nothing is more hopeless than man in the condition of thinking—'It is of no use for me to try.' The one seems a weed on a desolate shore, the other a plant set in a genial clime. We would therefore—while not absolving the rich from their great duties towards the poor—desire to see the industrious classes looking sideways as well as upwards for matters calling for redress and rebuke, and exercising a strong and well-directed public opinion among themselves. They would form a court, we thoroughly believe, more efficient for the remedy of all injury and oppression beyond law occurring in their own circle, than any other that could be framed; for public opinion is somewhat like gravitation—its force diminishes in the ratio of the squares of the distances, so that the censure of a gentleman can be endured and scoffed at, while the indignation of a group of immediate neighbours, however humble, would be too uncomfortable to be readily incurred a second time.

DANISH JUSTICE.

THE war had broken out between England and France: Bonaparte had broken the treaty of Amiens: all was consternation amongst our countrymen in India, particularly those who had valuable cargoes at sea, and those who were about to return to their native land. I was one of the latter class; so I joyfully accepted a passage home on board a Dane—Denmark, as yet, remaining neuter in our quarrel.

So far as luxury went, I certainly found her very inferior to our regular Indiamen; but as a sailer, she was far superior, and in point of discipline, her crew was as well-regulated, and as strictly commanded, as the crew of a British man-of-war. In fact, such order, regularity, and implicit obedience I could never have believed to exist on board a merchantman.

The chief mate was one of the finest young men I ever saw. He had just been promoted to his present post—not from the mere fact of his being the owner's son, but really from sterling merit. He was beloved by the crew, amongst whom he had served, as is usual in the Danish service, five years, and was equally popular with his brother officers and the passengers returning to Europe.

The only bad character we had on board was the cook, a swarthy ill-looking Portuguese, who managed somehow or other daily to cause some disturbance amongst the seamen. For this he had often been reprimanded; and the evening when this sketch opens, he had just been released from irons, into which he had been ordered for

four-and-twenty hours by the chief mate, for having attempted to poison a sailor who had offended him. In return for having punished him thus severely, the irritated Portuguese swore to revenge himself on the first officer.

The mate, who was called Charles, was walking in the waist with a beautiful young English girl, to whom he was engaged to be married, stopping occasionally to admire the flying-fish, as they skimmed over the surface of the water, pursued by their cruel destroyer, talking over the anticipated bliss their union would confer, their hopes and fears, the approval of their parents, their bright prospects, indulging in future scenes of life as steady as the trade-wind before which they were quietly running—when suddenly, ere a soul could interpose, or even suspect his design, the cook rushed forward and buried his knife with one plunge into the heart of the unfortunate young man, who fell without a cry, as the exulting Portuguese burst forth into a demoniac laugh of triumph.

Unconscious of the full extent of her bereavement, the poor girl hung over him; and as a friend, who had rushed forward to support him, drew the knife from his bosom, her whole dress, which was white, was stained with his blood. With an effort Charles turned towards her, gave her one last look of fervent affection, and as the blade left the wound, full a corpse in the arms of him who held him.

By this time the captain had come on deck. He shed tears like a child, for he loved poor Charles as his own son. The exasperated crew would instantly have fallen on the assassin, and taken summary vengeance, so truly attached had they been to the chief mate, and were only kept within bounds by their commander's presence. The cook, who appeared to glory in his deed, was instantly seized and confined. The corpse was taken below, while the wretched betrothed was carried in a state of insensibility to her cabin.

Eight bells had struck the following evening, when I received a summons to attend on deck. I therefore instantly ascended, and found the whole of the crew, dressed in their Sunday clothes, together with all the officers of the ship, and the male passengers, assembled. The men off duty were lining either side of the deck; the captain, surrounded by his officers, was standing immediately in front of the poop; and the body of the unfortunate victim lay stretched on a grating, over which the national flag of Denmark had been thrown, immediately in the centre. In an instant I saw that I had been summoned to be present at the funeral of the chief mate, and my heart beat high with grief as I uncovered my head and stepped on the quarter-deck.

It was nearly a dead calm: we had passed the trades, and were fast approaching the line: the sun had begun to decline, but still burnt with a fervent heat; the sails hung listlessly against the masts, and the mainsail was brailed up, in order to allow the breeze, should any rise, to go forward. I had observed all the morning a still more sure indication of our approach to the torrid zone. Through the clear blue water I had remarked a couple of sharks following the vessel, accompanied by their usual companions—the pilot-fish. This the sailors had expected as a matter of course, as they superstitiously believe that these monsters of the deep always attach themselves to a ship in which a dead body lies, anxiously anticipating their dreadful meal. In their appearance, however, I only saw the usual announcement of our vicinity to the line.

In such weather, placed in a ship, which seems to represent the whole world—shut out from all save the little band that encircles us, with the wide and fathomless element around us—the ethereal throne from which God seems to look down upon us; at one moment our voice rising in solemn prayer, for one we have loved, and the next, the splash of the divided waters, as they receive in their bosom the creature He has made—all these, at such a moment, make the heart thrill with a deeper awe, a closer fellowship with its Creator than

any resident on shore can know—a consciousness of the grandeur of God and the feebleness of man, which those alone can feel who 'go down in ships, and see the wonders of the deep.'

I took my place with the other passengers. Not a word was spoken, for we all believed we were about to witness the last rites performed over our late friend, and consequently stood in anxious silence; when suddenly a steady tramp was heard, and the larboard watch, with drawn cutlasses, slowly marched down the waist, escorting the murderer, whom they conducted to the side of the corpse; then withdrew a few paces, and formed a line, which completed the hollow square.

We now began to exchange glances. Surely the assassin had not been brought here to witness the burial of his victim; and yet what else could it be for? Had it been for trial (as we had heard that the Danes often proceeded to instant investigation and summary punishment), we should probably have seen the tackle prepared for hanging the culprit at the yard-arm. This, however, was not the case; and we all, therefore, felt puzzled as to the meaning of the scene.

We were not long kept in doubt. The second mate read from a paper which he held in his hand the full powers delegated to the captain to hold courts-martial, and carry their sentences into effect, the law in similar cases, &c. &c.; and called on the prisoner to know whether he would consent to be tried in the Danish language. To this he willingly assented, and the court was declared open.

The flag was suddenly withdrawn from the face of the corpse; and even the monster who had struck the blow shuddered as he beheld the calm, almost seraphic look of him whom he had stricken.

The trial now proceeded in the most solemn manner. Evidence of the crime was adduced, and the deed clearly brought home to the accused. I confess that my blood turned cold when I saw the knife produced which had been used as the instrument of the murder, and the demon-like smile of the prisoner as he beheld it, stained as it was with the blood of one who had been forced by his duty to punish him.

After a strict investigation, the captain appealed to all present, when the prisoner was unanimously declared guilty.

The officers put on their hats, and the captain proceeded to pass sentence. Great was my surprise (not understanding one word which the commander said) to see the culprit throw himself on his knees, and begin to sue for mercy. After the unfeeling and obdurate manner in which he had conducted himself, such an appeal was unaccountable; for it was quite evident he did not fear death, or repent the deed he had committed. What threatened torture could thus bend his hardened spirit I was at a loss to conjecture.

Four men now approached and lifted up the corpse. A similar number seized the prisoner, while ten or twelve others approached with strong cords. In a moment I understood the whole, and could not wonder at the struggles of the murderer, as I saw him lashed back to back, firmly, tightly, without the power to move, to the dead body of his victim. His cries were stopped by a sort of gag, and, writhing as he was, he, with the body, was laid on the grating, and carried to the gangway. The crew mounted on the nettings and up the shrouds. A few prayers from the Danish burial-service were read by a chaplain on board, and the dead and the living, the murderer and his victim, were launched into eternity bound together!

As the dreadful burden separated the clear waters, a sudden flash darted through their transparency, and a general shudder went round, as each one felt it was the expectant shark that rushed forward for his prey. I caught a glance of the living man's eye as he was falling: it haunts me even to this moment; there was more than agony in it!

We paused only for a few minutes, and imagined we saw some blood-stains rising to the surface. Not one

amongst us could remain to see more. We turned away, and sought to forget the stern and awe-inspiring punishment we had seen inflicted.

Of course strange sights were related as having appeared to the watches that night. For myself, I can only say that I was glad when a sudden breeze drove us far away from the tragic scene.

A SCOTCHMAN IN MUNSTER.

AMONG a variety of pleasant works which have lately issued from the Dublin press, through the taste and enterprise of Mr M'Glashan, we would particularly notice one entitled 'Revelations of Ireland,' by D. Owen-Madden, as containing some interesting sketches of Irish social history in the past generation. Himself a lawyer, the author presents numerous anecdotes of the Irish bar, which will be new to many readers; and so likewise will be his revelations of family distress, caused by those unhappy and ill-judged penal laws by which gentlemen could be robbed of their estates by persons professing a different religious faith. Of transactions of this kind, however, Mr Owen-Madden very properly allows that Ireland has too long maintained a recollection, which can serve no good purpose. The errors of past legislation are gone and expiated, and ought accordingly to be forgotten. The great question now is—How can Ireland be improved—how put in the way of well-doing? Two things, our author infers, can do little good—'parliament and speech-makers.' What is wanted is self-relying and intelligent industry; for the exercise of which the country offers a wider and more favourable field than is generally understood. As an instance of what may be done in this respect, Mr Owen-Madden gives an account of a Scotchman in Munster, which we beg to extract, in an abridged form.

'The handsomest country town in Ireland is Fermoy, nearly in the centre of Munster; it is picturesquely seated on the Blackwater, and, with its cheerful aspect and handsome scenery, never fails to arrest the attention of the most careless traveller. The streets are spacious, and the town is tastefully designed. There is a neat square, with some fine churches, and several private residences of respectability in the neighbourhood. The place looks bright and happy, not like the other dreary and dilapidated country towns in Ireland. Two large barracks, built in squares on the north side of the town, contribute to the imposing appearance of the place.

'Fermoy has now seven thousand inhabitants. Sixty years since the place was a dirty hamlet, consisting of hovels, and a carman's public-house, at the end of a narrow old bridge; now, there is a cheerful and agreeable town, pleasant society, a good deal of trade, and more prosperity than might be expected. How was all this accomplished? By the enterprise and energies of one man.

'John Anderson was a Scotchman, born in humble circumstances, of which he always boasted when raised to mix with the nobility of his adopted country. While very young, he learned to read and write, and he attributed the energy of his character to the stimulus which he received from education. He made a few pounds in some humble employment, and settled at Glasgow about the year 1784. There he was fortunate in some small speculations, and by a venture in herrings, acquired five hundred pounds—an immense sum to him. He then determined to seek some new sphere, where he might exert himself; and he thought that Ireland would be the best place for him to fix in. The commercial advantages of Cork, with its noble harbour, attracted him, and he settled there. He became an export merchant, and trafficked in provisions, the staple trade of the place. In a very few years he realised twenty-five thousand pounds, and laid it out on the purchase of four-sixths of the Fermoy estate. If he had been an Irishman, he might probably have stopped there, and resolved, after the fashion of the people, "to enjoy him-

self" after having made his fortune. He would probably have got a pack of hounds, given dinners daily to hungry *squireens*, earned the reputation of a "real good fellow," by copiously diffusing whisky-punch, and living, like a "real gentleman," in vulgar ostentation. But Anderson was a man of too much energy to settle down in the rotting idleness peculiar to the gentry of the country. Bishop Cumberland's saying, "Better to wear out than to rust out," was Anderson's maxim. Instead of "giving a tone to society," he aspired to create society where it did not previously exist. He resolved to make a town at Fermoy.

'The first thing he did was to build a good hotel for the accommodation of those travelling post. He added next a few houses, built a square, and at his own expense rebuilt the bridge, which had become ruinous. He did not go with hat in hand to the lord-lieutenant, begging for a share of the public moneys. He was resolved to depend upon himself. When he had mapped out his design for a town, he learned that the government was meditating the erection of large barracks in Munster. Mr Anderson saw the advantage which the presence of a garrison would be to his rapidly-rising little town, and he at once offered government a capital site, rent free, for the barracks. He made this offer in 1797, when the country was disturbed, and when accommodation was an object to the government. His offer was accepted. Two very large and handsome barracks were built. But Anderson did not stop there. He was not of that pernicious opinion, too prevalent in Ireland, that government should be invoked to do the work of individuals. He saw that the presence of officers would be likely to make a gay neighbourhood, and accordingly he built a theatre, and some additional houses, and invited various families with more or less capital to come and settle at Fermoy. He built for himself a handsome residence, and placed himself at the head of the community which rapidly began to grow around him.

'Meantime this enterprising man had not given up his business. He established a bank, and discounted to a considerable extent. To develop the material resources of the country around him, became a leading object with him. Travelling in Ireland was very dangerous and expensive. Mr Anderson determined to reform it. He established a Mail-Coach Company, and the first coach which ran between Cork and Dublin was established by Mr Anderson. What can show the backward state of society in Ireland more than the fact, that public coaching between the two chief cities in Ireland only dates from half a century back?

'Again, what can show the neglect of opportunities by Irishmen more than the circumstance, that Anderson, a Scotchman, and Bianconi, an Italian, should have been the chief improvers of travelling in Ireland?

'In addition to his other works, he established an agricultural society. He did not neglect education, and built a large schoolhouse for the town. A military college was also built by him, which was afterwards turned into a public school, and was presided over by the Rev. Thomas Hincks. In every possible way he laboured within his sphere to civilise and improve.

'Politics he appeared to think a nuisance more than anything else. In Whigs and Tories—in Nationalists bawling about Irish glory, and Imperialists talking about civilisation, he had no faith whatever. He kept clear of their factions and intrigues, and went right on to do the work before him. He continued, however, to have great influence with the ruling powers; for such men always command influence: they have no occasion to solicit it. A minister of state counts himself fortunate when he meets with such a man as Anderson. Thus, though there was no harmony of political feeling between the Irish government and Mr Anderson, he had always great authority at Dublin Castle. His opinions were those of a rational and progressive Whig, sincerely favourable to liberty of

thinking, attached to quiet, and who estimated the good and evil of measures chiefly by their obvious utility. His sentiments, however, he rarely uttered. On one side he saw a narrow-minded oligarchy—on the other an uncultivated democracy. He witnessed the petty spirit and ridiculous airs of consequence assumed by the provincial gentry, and he beheld the mass of society half sunk in the slough of despond. He did not waste time in stooping to conciliate their prejudices, but he took good care not to offend them. While society was divided by splenetic controversy, he showed that he respected all forms of the Christian faith. Thus he gave three thousand pounds to build a church for the Protestants; but he also gave five hundred pounds, and a site rent free, for a Catholic chapel.

It must not be understood that Anderson was a man of vast resources. He was probably never worth more than fifty thousand pounds; but he kept his capital in circulation, and allowed none of it to remain unemployed. Industry and enterprise were the sources from which he made his fortune, and by means of which he benefited all the people around him.

The station in society reached by such a man was of course most respectable: his friendship was courted, and his society was sought for. His manners were agreeable and courtier-like, and calculated to make friends. He had no John-Bullish self-complacency—no Hibernian ostentation—and, I will add, no Scotch niggardliness. From his manners in company, it would have been hardly possible to infer his country. He had much more enjoyability than is commonly to be found in Scotchmen, and was fond of relaxing in society.
